
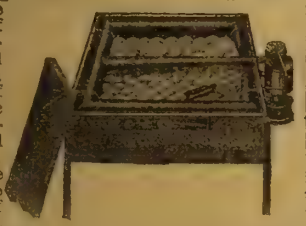
In fact, over 200 illustrations in all and they are accompanied with mighty interesting and instructive reading. See to it that you get your copy right away. Write for it now while you have the time and mention in your letter that you want the book told about in The Wisconsin Farmer. Write to the M. M. Johnson Co., Clay Center, Neb. This company make the Old Trusty incubators and brooders and for this reason we are showing some illustrations of their incubator. The first illustration shows the interior of the Old Trusty incubator, also triple construction of the non-conducting walls, top and bottom. The first wall is made of seven-eighths-inch California redwood, the second of asbestos insulation and over all is a covering of metal. There is not a particle of wood exposed, even the legs are made of heavy metal.



The Old Trusty was the first incubator east of the Rocky Mountains in which California redwood was used. It is thought to be the best wood for this use because it is light, soft and non-odorous. It does not warp. This lumber is seven-eighths inch thick and is covered with a sheet of asbestos insulation. The lamp is placed at the end and with the metal covering and asbestos insulation there is practically no chance of fire. The second illustration shows the top removed—the method of heat distribution to every part of the machine—the roomy, convenient arrangement and the location of thermometer and regulator. You want the facts direct from the Old Trusty factory, so write them today for their free poultry book and state that you want to know more about the Old Trusty. They are in a position to give you a lot of information on poultry, incubators and brooders, whether you buy a machine or not, which includes the book mentioned above. The third illustration shows teh 1916 machine as it looks at work. It is neat and have every appearance of being substantial in every detail. Its construction combines every fundamental principle that the M. M. Johnson Co. have learned in their years of incubator construction. The easiest way to find out about the Old Trusty is to ask a neighbor who has one or write to the M. M. Johnson Co., Clay Center, Neb., for their Poultry Book and special testimonial sheets. The fourth illustration will especially interest you if you are going to purchase an incubator this year. It shows how the Old Trusty is packed for shipment. The crate is in every way all that is necessary to entirely protect the machine from all the usual abuse of shipping and adds very materially to your advantage when you receive the machine. It is also light, which means a saving in freight or express. And, by the way, we must not neglect to say that, in spite of the very low prices on Old Trusty Incubators that the M. M. Johnson Co. pay all freight charges to any point and in cases where the users insist on rush shipment that they also pay the express charges to several states surrounding Nebraska. A large stock of machines is carried at St. Joseph, Mo., so that prompt delivery is assured to purchasers. Drop the M. M. Johnson Co., Clay Center, Neb., a post card or letter right now and they will mail you your copy by return mail, free. Just mention this paper when you write. See advertisement on page 17.—Adv.

Wagon Parts of All Kinds.

IF you need wagon parts of any kind it will pay you to answer the advertisement of the Electric Wheel Co. on page 35. They will send you a free booklet describing all kinds of parts for wagons, together with their prices. They make every kind of wheel—steel of wood, high or low, wide or narrow tires. Address Electric Wheel Co., 65 Elm St., Quincy, Ill., and please mention this paper.—Adv.

PRICE COUNTY SHORT COURSE.

The one week short course for boys and girls conducted January 10-14, 1916, by the Price county, Wisconsin, agricultural representative, was a most successful one. The total attendance was twenty-one students composed of nineteen boys and two girls. Although the weather was the coldest that has been experienced this winter, the mercury going down as low as 34 degrees below zero, there were twenty of the students whose attendance was perfect. The other student who was not there every day became sick, so was unable to attend school. This perfect record of attendance is significant because it is an indication of the interest these boys and girls took in this agricultural work and also shows that they are anxious to get more education. When the class was asked if they would like another week's work the vote was unanimous in favor of a second week of work. It is impossible to give more work because the county representative gives agricultural instruction in the Price County Training School. This is very important because the graduates of this school must teach agriculture in the rural schools, so it is very necessary that they get this instruction.

An effort will be made to get these students to actually put into practice on their own farm some of the good farm practices which they have learned about. It is barely possible that a cow-testing club will be organized among the students. They will be required to weigh and record the milk from each cow. Milk samples from each cow will be taken once a month. These will be brought to Omega and the class do the testing. Farmers in the vicinity of Omega who want to keep records on their cows may also have milk samples tested at the same time.

A similar course will be given to any town in Price county if there is a demand for it. Anyone interested write to Griffith Richards, Phillips. The following is the list of names of students who attended: Axel Ahlen, Arvid Ahlen, Arnold Bjorklund, Lawrence Carlson, Clarence Carlson, Albin Clarin, Lizzie Erdman, Elster Hallberg, Howard H. Johnson, Elmer Johnson, Albin Koehler, Emma A. Luedke, Otto H. Luedke, Joe E. Lindberg, Theo Meyer, Alvin Murray, Walter Nelson, Leonard Risberg, Bert Swanson, Gotfred Weberg, Elmer Westlin.

Protect Your Chickens with Lawn Park Coops.

LAWN PARK chicken coops protect chickens from hawks, rats and other animals and at the same time give them all the advantages of the open air. The wire frame pulls out like a drawer for the day time and can be shoved back at night or during storms, so as to afford perfect protection. It is made of galvanized metal, which repels vermin, and is easily cleaned and kept sanitary. You can learn all about Lawn Park coops by writing to Cyclone Mfg. Co., Dept. 21, Urbana, Ill., and mentioning their advertisement on page 20.—Adv.

FARMERS' SCHOOL AT ASHLAND.

To the Editor:—The third annual farmers' school will be held at the branch experiment station at Ashland Junction, Wisconsin, during the first part of March, beginning March 6th. The school will continue for one or two weeks. Persons desiring to attend this school should register at once and state whether they want to attend for a week or for two weeks. Names will be entered in the order they are received. In the past it has been necessary to turn down some of the last applicants for lack of room. The course this year will be given largely to discussions of problems of dairying, live stock farming in general and crop production. It is also proposed to have a two days' session for homemakers.

Persons desiring further information may address the undersigned.

E. J. Delwiche.

PRINCE ALBERT

the national joy smoke

puffs its kindly way right into your good will because it is so friendly and cool and fragrant. You may smoke it as long and as hard as you like and it will not bite or parch or tire your taste! The patented process by which Prince Albert is made *fixes that!*

You smokers should realize that the Prince Albert patented process is owned exclusively by us; that no other tobacco can be like Prince Albert. And you'll find out how different P. A. is from any other tobacco you ever smoked just as soon as you try it *and know for yourself* that what we tell you is *proven by your own test!*

Buy some today and smoke it in your old jimmy pipe or roll it into the best makin's cigarette you ever put in your mouth. *It will absolutely delight you!*

Buy Prince Albert everywhere tobacco is sold. Toppy red bags, 5c; tidy red tins, 10c; handsome pound and half-pound tin humidors—and—in that fine crystal-glass humidor with sponge-moistener top that keeps the tobacco in such splendid condition—always!

On the reverse side of this tidy red tin you will read: "Process Patented July 30th, 1907," which has made *three* men smoke pipes where *one* smoked before!

R. J. REYNOLDS TOBACCO COMPANY, Winston-Salem, N. C.

AGAIN! DOWN GO SEPARATOR PRICES!

Four 1916 Sizes! Four New Low 1916 Prices!

~~42~~50
~~51~~00
~~63~~50

I mean every word! Prices have gone down AGAIN! In spite of the increased cost of materials, on account of the large volume of separators going through my factories, I am able again to cut and slash cream separator prices as never before. My old 1915 prices are not in force today! My new lower than ever 1916 prices and easy selling plans (cash or time) are now in force!

A New Separator has been added to the great Galloway line of Bath-in-Oil Sanitary Cream Separators. It is identical with other sizes in quality and design and sells for less money than I ever sold a cream separator! Don't be mislead on cream separators thrown together and sold for a price. Buy direct from a real factory, get a better machine and save from $25 to $50 on the highest quality separator. 10,000 separators now coming through my factory—with new prices—special terms of no money down, 1 year to pay. I expect to sell them all between now and grass.

GALLOWAY SANITARY CREAM SEPARATOR

Big 1916 Book Is Now Ready

And I will mail it to you if you'll ask for it. 250 pages in size, printed in four colors and tells the truth about the cream separator business. If you buy a cream separator within the next twelve months you need this great book. I want you to know how I build these wonderful separators in my own great chain of factories, how they are designed, and how and why I can price a separator of highest quality at such new low prices. Read this book before you buy a cream separator of any make at any price. I'll be glad to pay the postage. Write for it today.

Look at These Features

Heavy, high carbon steel gear shafts and bowl spindle; extra long bearings; strong, sanitary bowl, discs not fastened together; oil bath lubrication; big, roomy, seamless, pressed steel supply tank; both gear shafts and both spindle bearings supported by one solid casting; heavy, sanitary tinware; low bowl speed reduces wear on bearings and gears.

No raw edges in the bowl to break up the globules of butter fat. *Separators shipped from Waterloo, Kansas City, St. Paul, Council Bluffs and Spokane—whichever is nearest you.*

WM. GALLOWAY COMPANY 33 GALLOWAY STATION WATERLOO, IOWA

NEW 1916 EASY SELLING PLANS!

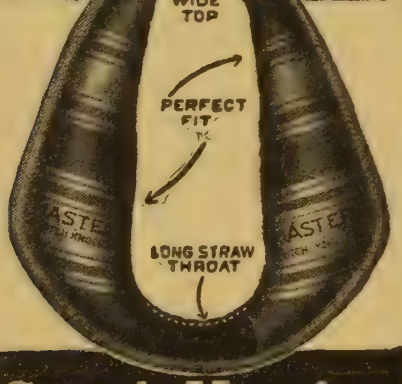
Collars That Cure—Prevent Sore Necks

Extreme care in the shaping, the building, and in the selection of materials used has produced in the Scotch Knocker a horse collar that entirely overcomes galled necks and sore shoulders.

The Scotch Knocker Collar works with your horse, assists him. It responds to every play of the muscles, snugs into every neck hollow, and lays back soft as velvet, yet staunch and firm against the pull of the powerful shoulders. Built so strong and durable that one Scotch Knocker will outlast *two* ordinary collars.

These collars come in different styles. Some are cloth faced but all are built of real *7-oz. bark-tanned leather*. They are stuffed with hand-flailed, long rye straw. Faced with soft, elastic sweat and rain proof hulls. Point of greatest strain triple reinforced. Write for free book.

Minnesota Harness Factory, Inc.
106 2nd St. W. Winona, Minn.



Scotch Knocker Collars

Don't Miss the Big Money

THE virgin soil that the stumps keep out of cultivation is the best soil you have. You can pull out an acre or more of stumps in a day at a cost of from 3c to 5c per stump. No matter how big or tough the stump, it walks right out when the Hercules gets hold of it. With the stump come all the long tap roots that spread out in all directions. The land is left ready for cultivation.

HERCULES
Triple Power Stump Puller

Let us send you proof that thousands of farmers have made big money by the Hercules. Get our money saving proposition.

Waukesha Guernsey Meeting.

Governor Philipp Enjoys the Day With Waukesha Society—Guernsey Men Look Back on Successful Year—Future Bright.

THE tenth annual meeting of the Waukesha County Guernsey Breeders' Association was held Wednesday, January 26th, at the beautiful Resthaven Hotel at Waukesha and was the largest attended winter meeting which has ever been held by this active and progressive organization. The meeting was full of enthusiasm and interest and 251 persons sat down at the banquet tables at noon to a sumptuous meal served in the big dining room at Resthaven. Many came after noon for the speaking program and at least 300 attended, which is a big increase over last year and considerably greater than any previous winter meeting.

The Waukesha county Guernsey organization is one of the pioneer community associations in the state and the writer doubts if a more aggressive organization is to be found anywhere. Waukesha county has learned much of its fame through the work of its Guernsey and Holstein associations and it was not surprising when one speaker who has recently returned from a long southern trip remarked that everywhere he went he heard Wisconsin mentioned as the leading dairy state and that invariably Waukesha county was connected with any mention of Wisconsin. The annual meetings of this association are becoming more popular every year and each year sees an increased membership. The association now has 127 active members, compard with 116 a year ago, despite the fact that many members, as Secretary Gavin McKerrow reported, had made their fortunes out of Guernseys and had retired. The combined increase in membership during the past two years has been the greatest of any two years in the history of the organization.

The secretary reported at the business session, which was held in the forenoon, that 227 persons attended the annual meeting last year and that 550 attended the last summer meeting at the Park Farm of John H. Williams. The association had just closed a very prosperous year, he reported, although the inquiries for stock had not been so large as during the previous year, due largely to the foot-and-mouth scare. However, during the last few months there has been a good increase and there has been several carloads shipped out of the county during that time. Prospects for this year are very bright with the foot-and-mouth matter clearing up and the question of holding a spring sale was discussed, but no definite action was taken, this being left to the directors. The secretary also reported that sixteen members of the association had cows in the yearly official tests during the last year which he believes to be the greatest number of men making such tests in any county breeders' organizations of any breed in the coun try. Two cows owned by members of the association have completed tests of 846 and 803 pounds of butter fat, respectively, during the year. This is the record butter-fat production for Waukesha county and it is believed this record will be lowered this year.

During the year the association undertook several new lines of activity, including the essay contest in which prizes worth $600 were given to the children of the county. Proposals to employ a county Guernsey agent whose duties would be to boost the Guernsey breed exclusively just as the county representative boosts the entire county were set afoot and this matter was discussed at the meeting, final action being deferred until the summer meeting in June. It was reported that $440 had been raised by private subscription to apply on the salary of such an agent and if he be employed it will be another innovation and certainly one of great benefit to the breeders.

Earl Roberts, of Oconomowoc, president, presided at all of the sessions. R. B. Benjamin, representing the Waukesha Live Stock Breeders' Association, the corporation formed to erect the sale pavilion at Waukesha, reported on the status of that project. The corporation has taken over the site owned by the Guernsey association in addition to two other lots in order to have sufficient room to erect a pavilion suitable for the needs of the breeders for years to come. Mr. Benjamin reported that $6,300 had been raised through subscriptions, but that the first cost estimate was too low and that the total cost of the pavilion, together with the site which cost $1,500, will be about $8,500. As a result it will be necessary to secure about $4,000 more in order to build as planned and avoid the necessity of mortgaging the property.

John H. Williams, treasurer, reported that the total receipts of the association for the year were $31,468.23 and that the association has a cash balance in the bank of $1,100.40, of which $310 belongs to individual subscribers for advertising purposes. This leaves a balance of $790.40 to the credit of the county association. Several communications were read by Secretary McKerrow, one from W. H. Caldwell, of the Guernsey Cattle Club, complimenting the association on its splendid work. The association also gave its approval to the proposed calf-growing contest in the county, which was also outlined at the recent Holstein meeting and which was given its support.

Roy Burton, of Eagle, H. N. Longley, of Dousman, and F. E. Fox, Waukesha, were elected directors for a term of three years at a directors' meeting after the general meeting the board elected Gavin McKerrow, of Pewaukee, president; George Lawson, of Oconomowoc, vice-president, and F. E. Fox, of Waukesha, secretary and treasurer, the board having decided to combine the latter offices.

Fifteen new members were also accepted as follows: Clinton Kinney, Norman Nelson, Harry H. Kohler, W. K. Wilson, Fred Barr, C. O. Porter, H. M. Stone, John H. Morris, Arvin P. Morris, L. K. Wilson, Elton C. Healy, A. C. Eschweiler, L. W. Seeburn, Delvin H. Utter and the Milwaukee County Agricultural School.

The banquet was held at 12:30, at which President Roberts acted as toastmaster.

Gov. E. L. Philipp, who is a Guernsey breeder and whose farm lies in Washington county, was the principal speaker and took as his subject the dairy farmer's interest in good government

Governor Philipp, after a brief review of agricultural conditions plunged into politics and defended the dairy and food commission, which has been under fire from his opponents, and the actions of the sanitary board in the foot-and-mouth fight last year. The governor said he wanted to be held personally accountable for the actions of the dairy commission and the live stock sanitary authorities and that he was determined to stamp out the foot-and-mouth disease and play no favorites if he never got another vote. The embargo against Illinois he said was still in effect and would remain in effect until that state was completely cleaned up.

Albert Fuller, of North Lake, president of the Milwaukee Milk Shippers' Association, explained plans on foot to incorporate and establish a milk depot for the farmers in Milwaukee. He said the Milwaukee dealers were dictating the milk prices; that the farmers could not get a fair price for their product and that it is up to the farmers to establish their own depots and be independent of the dealers. He asked the co-operation of all the farmers and invited them to attend a meeting which will be held shortly at North Lake.

C. P. Norgord, commissioner of agriculture, closed the speaking program with a review of the work of his department and the work it has outlined for the coming year.

Mr. Norgord explained a new plan which is now on foot relative to stamping out tuberculosis in cattle. His department proposes to co-operate with other states and the United States department of agriculture in giving cattle which have been tested a higher rating than those not tested. Herds tested and found free from tuberculosis will be listed as Class A herds and will be so listed by the veterinary departments in the state co-operating.

Harold Dvorak, of Milwaukee, gave an interesting reading and music was furnished during the afternoon by Mrs. Evangeline Olson and Miss Vinette, of Waukesha, and the Davies brothers, of Wales. Roy Burton, of Eagle, invited the association to meet at his farm in June, but final action was left to the directors.

Look Out For Warbles in Cattle.

European Maggot Which Attacks Backs of Cattle Discovered in Northern States.

SPECIALISTS of the United States Department of Agriculture are urging cattle owners, in the North as well as in the South, to take steps to rid their attle of ox warbles or "wolves," the importance of which to the cattle industry has been generally underestimated. Ox warbles are the whitish rubs or maggots which develop from he eggs deposited by certain flies nown as warble flies or heel flies and which injure the hides, reduce milk low and retard the growth of the anials. The maggots are commonly ound just below the skin on the backs f cattle in the spring. Their presnce is revealed by local swellings bout the size of pigeons' eggs, each vith a small central hole or perforaion through which the maggot reathes. From this hole the maggot, vhen mature, emerges to enter the round and change to the adult or fly tage. When full grown the grub is bout three-fourths of an inch in ength.

In the past trouble from the warbles as largely been confined to cattle in he South, but recently the bureau of ntomology has discovered that a secnd species, heretofore not found in his country, but known to be even a nore serious pest in Europe than is our native warble, has become well eslablished in certain districts in the northern part of the United States. While it is probable that this soalled European ox warble will not be of as great importance in the southern part of the United States as the species already established, there is every reason to believe that unless checked it will become generally distributed throughout the northern half of the country. This European species is now generally distributed throughout New York and the New England states and a few specimens have been obtained from western Pennsylvania, western Maryland, southern Michigan, eastern Iowa and Missouri and western Washington. Attention is also directed to the fact that this species is now generally distributed throughout southern Canada. The department, therefore, is calling attention at this time to the danger of spreading this species promiscuously about the country and is urging cattle owners to take the simple means necessary to prevent its spread.

Until recently warbles were not regarded as serious even in the South, because it was thought that the loss they occasioned came principally from the damage they did to hides. Even this loss in the aggregate, however, is important, as hides show warble holes three to six months in the year and dealers pay from 50 cents to $1.50 less for hides that show even moderate warble infestation. In many cases the scars left after the holes have healed cause buyers to cut prices considerably.

The loss from the warble, however, is by no means limited to the holes the maggots cut in the hides. Extensive investigations in Germany and Denmark indicate that the losses through reduction in milk supply in dairy cattle, the retardation of growth in young stock and the loss of flesh in all classes of animals are twofold greater than the damage done to the hides. In some of these tests the early extraction of the grubs from the backs of infested cattle resulted in an increase of nearly 25 per cent in the milk production. Animals from which the grubs had been extracted showed a gain of more than 5 per cent in weight over similar animals in which the pests were allowed to develop normally.

Thus far the veterinarians and entomologists of the department have determined no better way of controlling these pests than through the systematic extraction and destruction of the grubs from the backs of infested animals.

When the larvae are nearly ready to leave their host they may be easily squeezed out by pressing the swelling with the fingers, but if not so far developed it is often very difficult to get them out by squeezing. In such cases a slender pair of forceps may be used for pulling them out. If the swelling and its opening are still very small the best way of extracting the grub is to make an incision with a knife, after which the grub can be squeezed out by applying strong pressure. Kill the grub when removed.

It is important that warbles be removed as early in their development as possible. This relieves the infested animals from the irritation and prevents the enlargement of the exit holes. While this practice is not applicable to ranch conditions, it is easily put into effect on small farms and in dairies. In the southern states the herds should be gone over early in December and about twice later at monthly intervals. In the northern states the extraction should be begun six weeks to two months later. If no grubs are allowed to drop to the ground and reach maturity the number appearing in cattle in subsequent years will be materially reduced and if extraction is followed up for several years almost complete eradication will result. Of course, it is important where possible to get concerted action among the stockmen in the destruction of these pests.

In extensive experiments along this line in Germany it was determined that the cost of removing all of the warbles from the backs of cattle during one season was about 3 cents per head. In this case men were employed especially to do the work. It is possible for practically every farmer and dairyman in this country to accomplish this work without material expense or loss of time.

It is suggested that in those communities where cow-testing associations have been formed the men charged with this work could in many cases devote part of their time to educating the stock raisers as to the losses caused by ox warbles and to aiding the members of the association in destroying the pests.

Investigations conducted by the department indicate that eradication also may be accomplished by the use of the arsenical dips, which are extensively employed at the present time for destroying cattle ticks. These investigations are being extended and experimental work is in progress which it is hoped may establish effective and practical methods of destroying warbles. The arsenical dip appears to act not upon the well-developed grub beneath the skin but upon the eggs or the newly hatched larvae, probably the latter. It is not unlikely that the destructive action of arsenical dips upon warbles is more or less dependent upon the fact that arsenic is stored up in small quantities in and upon the skin of cattle which are repeatedly dipped in arsenical dips.

The discovery of the European ox warble in certain sections of the North makes this pest significant to northern cattle raisers and to those who import pure-bred or other cattle from these sections. During the winter and spring months considerable numbers of pure-bred live stock are purchased in the northeastern states and are shipped to various parts of the country. It is urged that all animals thus transported be examined by the purchasers and all grubs destroyed during the spring and summer. Animals purchased at any season of the year may harbor these pests. In the winter and spring they will be found beneath the skin on the back, while at other times of the year the grubs are elsewhere in the body of the host and it will be necessary to watch for the appearance of these grubs during the following season. In those states in which registration of all imported animals is required it would be comparatively easy for the authorities to follow up such importations and see that any warbles are destroyed.

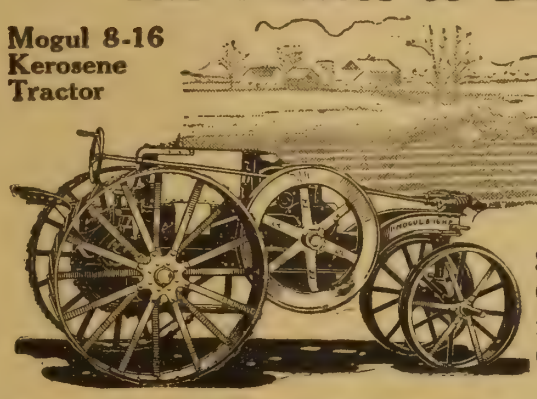
Mogul 8-16
The Tractor to Buy

Mogul 8-16 Kerosene Tractor



$675 Cash, f. o. b. Chicago

WON HIGHEST AWARD PANAMA PACIFIC INTERNATIONAL EXPOSITION SAN FRANCISCO

AT the price, the **Mogul 8-16 tractor** deserves the careful attention of all progressive farmers.

It won a Grand Prize at both San Francisco and San Diego Expositions. That proves its class.

It can be used with profit on small farms, doing all the hardest work of the horses, and much that horses cannot do. That proves its usefulness.

It betters the plowing and other work of seed bed preparation, while reducing its cost, and—

It burns kerosene under all conditions. This one reason is enough to sell a **Mogul 8-16**, because, on the average, **gasoline costs about 65 per cent more than kerosene.** That proves its economy.

It costs about half its equivalent in horse flesh.

The price is **$675 cash, f. o. b. Chicago.**

A tractor so good, so useful on farms of all sizes, so economical, and at such a price, deserves a thorough investigation. Your local dealer should be able to show you a **Mogul 8-16.** If he can't, write to us. We'll see that you get a look at it, and we will also send you our new book, "Tractor Power vs. Horse Power."

Registered U.S. Pat. Off.

If your roof leaked would you say "I can't afford to fix it" and let the rain go on damaging your home? Not by a jugful! You'd fix that roof if you had to borrow the money.

Your farm without a spreader leaks profits. All the manure doesn't reach the land and what does go isn't properly spread. It misses some spots and in others is too thick. A farm with 20 head of cattle and horses loses enough manure value yearly to buy a spreader.

Make your farm pay its real profit. Stop the waste of manure by the fork-and-wagon method. Make money with the **NEW IDEA,** the spreader with so many special features that it's the acknowledged leader. You can load it as high as a wagon box and spread 3, 6, 9, 12, 15, 18 loads per acre without fear of clogging.

The New Idea pulverizes finely and spreads more evenly than you could possibly do with a fork. The double cylinders take care of that. Our revolving distributor, a patented feature, spreads the manure seven feet wide, across three corn rows. It spreads beyond the wagon tracks and you don't have to drive over spread manure.

No Gears to Strip, Break or Freeze

Another proof of New Idea superiority. This spreader is operated by a heavy sprocket chain. This saves power and is easier on the horses. Special axle feed. Strong chain conveyor running over tight bottom brings every bit of manure to the cylinders. Can't slip and won't race going up hill. Wheels track, making easy going.

OUR LEGAL DEPARTMENT

THIS department is edited by a practicing lawyer who has had years of experience at the bar. He will give accurate and reliable answers to all legal questions when they are of sufficient importance to be of practical interest to any considerable number of our readers. Subscribers who desire questions answered in this department should base them upon a brief, plain, concise statement of the actual facts. To insure immediate attention inquiries should be addressed to "The Legal Department," in care of this paper; but as the inquiries sent are at times very numerous, thus delaying printed answers, those to whom it is important to receive an immediate reply by mail should remit $1.00, addressed as above.

LAW QUESTIONS.

Dog Fight—Killing Dog.

A Subscriber, Mindoro, Wis.—A was driving along a public highway and his dog was following the rig. In passing B's farm, B's dog ran out into the road and attacked A's dog and A shot B's dog. Had he a right to do so, and can B recover damages from A by law?

Answer.—If it was necessary to shoot B's dog in order to prevent it from killing A's dog or doing it great injury A had a right to shoot it and B cannot recover damages, but if it was not necessary B can recover damages.

Personal Injury—Liability.

A Subscriber, Cato, Wis.—I loaned my sawing outfit to a neighbor I thought the outfit was in good condition at the time. While my neighbor was operating it a box broke the saw and it became loose and cut a man in the face so that he will be disfigured for life. The injured man was employed by said neighbor's son at the time. He has sued me for $1,500. Can he recover damages from me?

Answer.—He cannot. You are not liable. If anyone is liable it is the neighbor or his son.

Collection of Note.

A Subscriber, Lena, Wis.—Three years ago A owed a store keeper some money, and gave him a note for the amount, payable at a certain time. When the note was due, A had the money ready to pay it, but he did not hear from the store keeper about it, but a short time ago the store keeper found the note which had been mislaid ever since it was due. Can the note be collected from A by law, under such circumstances?

Answer.—The note can be collected from A by suit in court, judgment and execution, provided A owns enough property exempt from execution. The fact that the note was not presented for payment when due does not relieve A from liability.

Widow's Share of Estate—Will.

A Subscriber, Burlington, Wis.—A widower having children of age, married a widow who also had children of age. There are no children of the present marriage. All the property the man owns was accumulated by him and his first wife and children. His present wife had no property when she married him. (1) If the man should die without making a will, how much of his estate would his widow be entitled to by the law of Wisconsin? (2) How much property can the man will to his wife, without danger of having the will set aside by his children?

Answer.—(1) The widow would be entitled to dower in his real estate, which means one-third of it for her life time. She would also get from his personal property what is called the widow's allowance, consisting of household and kitchen furniture and other personal effects, and provisions, and besides such allowance, a child's part of the balance of the personal property—share and share alike with the husband's children. (2) The man has a lawful right to will all of his property to his wife, and such a will could not be set aside if the man was of sound mind when he made it, and was not induced by fraud or force to make it.

Husband and Wife—Descent of Property.

A Subscriber, Faribault, Minn.—A and B are husband and wife. Each one was married before, and has children by the former marriage, but has none by the present marriage. When they intermarried, A had some land with debts against it. After their marriage they paid off said debts, and bought more land, and now have forty-five acres. (1) If A dies first without making a will, what portion of his property real and personal will B get by law? (2) Will B's children get any of A's estate? (3) Could B will her share of A's estate to her children? (4) Could B sell the land if A dies without making a will? (5) In case B dies first without making a will, what portion of her property will go to her children? (6) If buildings are placed on A's land by B's children can they take them away, or get pay for them when B dies?

Answer.—(1) B will get the homestead for her lifetime and (2) the homestead will be equally divided among A's children. B will get a widow's allowance out of A's personal property and one-third of the balance of it. (2) They will not. (3) After receiving her share of A's estate B can will the same to her children. (4) She could not. (5) Two-thirds. (6) This depends upon facts and circumstances which you have omitted to state in your letter and, therefore, the question cannot be answered here.

Overhaul That Engine

Put it in shape to give more power than it ever did. Don't go along with defective piston rings that waste power, fuel and oil—install

McQUAY-NORRIS
LEAK-PROOF
PISTON RINGS

The only durable and effective form of gas-tight and oil-tight seal for the piston.

LEAK-PROOF Piston Rings make compression perfect, give you every possible bit of power, and save lubricating oil. They are permanently elastic, never lose fit or bearing, won't score cylinders, and will outlast the motor.

LEAK-PROOF Piston Rings are made in all sizes—easily installed. You can get them from your supply dealer. If he hasn't them—write us, giving his name. We'll see that you are supplied.

McQuay-Norris Mfg. Co., 2820 Locust St., St. Louis, Mo.

Send for FREE booklet—"To Have and to Hold Power". It tells all about compression and what LEAK-PROOF efficiency means.

The "Easy-Opener"

Works Smoothly

The drawing is about half-size. When you get a knife, get a good one. To get this one, read our offer and act upon it at once.

Sonny---

Here's a real knife: a knife you'll brand a "beaut" the minute you see it.

Whether it's mumble-peg, "whittlin'," or the thousand and one uses you have for a knife, this Easy-Opener will always "deliver the goods." The blades are of Sheffield steel, hardened in oil and uniformly tempered.

To every person sending us $1.00 for the FAMOUS DOLLAR TRIO, (The Housewife, regularly 50c; McCall's with pattern, regularly 50c, and People's Home Journal, regularly 50c each for one year) will be sent an Easy-Opener Knife, postpaid.

Double Value In Our Offer---

The Housewife	$ .50
McCall's and pattern	.50
People's Home Journal	.50
Easy-Opener Knife	.50
Value	$2.00

You Send But One Dollar

Knife and magazines will be sent to different persons if desired.

BOYS—Get daddy or mother to subscribe. They will enjoy the magazines and you will enjoy possession of such a knife.

PARENTS—Why not take advantage of this offer? You get the big magazine value and the boy will be delighted with the knife.

FARM MECHANICS

Auto, Farm Engine and Farm Machinery Ailments diagnosed and remedies suggested in this department.

QUESTIONS AND ANSWERS.

Motor Used as a Generator.

Can a 110-volt motor be used to furnish current for 110-volt lamps? If so, what horse power motor would be required to furnish current for eight sixteen-candle-power lamps?

Answer.—Nearly all D. C. motors may be run as generators. It is usually advisable to change the position of the brushes so as to prevent sparking and place a rheostat in the field circuit to control the voltage. A one-third horse power generator would supply eight sixteen-candle-power tungsten lights.

Wet Cells for Lighting.

I am thinking of trying wet cells for lighting purposes. How many would be required to properly light three twenty-watt lamps? How long would the batteries last if used three hours each night?

Answer.—It is not practical to use wet cells for lighting on account of the cost. The number of cells required would depend upon the voltage of the lamps. The best cell for this purpose is the Edison-Lalande cell. Three of these cells are required to produce two volts. The larger the cell the more amperes it will furnish. In any case it would cost too much to maintain the battery to make it practical for house lighting.

Horse Power of Engine.

I would like to know how to figure the compression pounds relating to the horse power of my gas engine, which has an eight-inch bore and sixteen-inch stroke.

Answer.—The compression of your engine is probably forty to sixty pounds per square inch of piston area. After the explosion the average pressure acting on the piston is about seventy pounds per square inch. To find the horse power of a stationary gas engine multiply the average pressure by the length of stroke in feet by the area of the piston head in square inches by the number of explosions per minute and divide by 33,000. The area of your piston head is fifty and one-fourth square inches. At 350 revolutions per minute your engine should develop twenty to twenty-five horse power.

A Homemade Tractor.

I have a homemade tractor of the three-wheel type. The drive wheel is twenty inches wide and forty-eight inches in diameter. I am using a thirty-horse-power "Beaver" motor. A sixteen-tooth pinion on the crank shaft drives a 120-tooth gear on the jack shaft. A fourteen-tooth pinion on the jackshaft drives a 102-tooth gear bolted to the drive wheel. What drawbar pull can I expect and how many fourteen-inch plows can I pull on high?

Answer.—If your engine runs at 800 revolutions per minute you are geared to about two miles per hour, the correct speed for plowing. At that speed your drawbar pull would be about 2,000 pounds under favorable conditions. You should have more drive wheel area. With your present drive wheel you could not expect to pull more than two fourteen-inch plows. You might pull three with a wider and larger drive wheel. To pull two plows your tractor should weigh about 3,200 pounds.

Carburetor Floods at Low Speed.

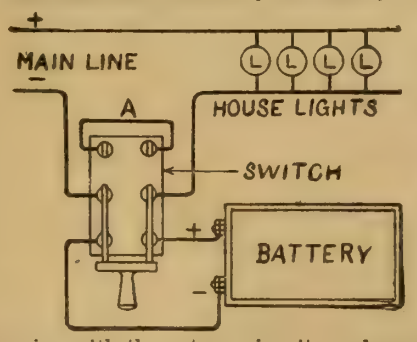
I have a 1913 forty-horse-power car which seems to be in good condition in every way. The compression is fine, and even on all the cylinders. The spark is good. The trouble seems to be with the carburetor, but I have tried five different sizes and makes of carburetors without results. The motor starts easily, but every time the motor slows down the carburetor fills with gas, and when the throttle is opened the motor either misfires or stops entirely. The motor runs fine at speeds above twenty miles per hour, but when it stops there will be one to six ounces of gasoline run out of the carburetor—it makes no difference what kind of a carburetor it is or how the float is set. I would appreciate any suggestion.

Answer.—We would say that you are using a carburetor entirely too small for your engine. The smaller the carburetor the greater the suction tending to draw the gasoline out of the needle valve. What you need to do is to lessen this suction. Before obtaining a larger carburetor put a very weak spring on your auxiliary air valve. It may be that this will lessen the suction enough so that your present carburetor will work at low speeds.

Charging Battery.

I would like to ask some questions regarding the care of my electric lighting plant. I have a thirty-two-volt system. I have been charging about once a week, beginning at noon and charging until bedtime, using current for light for that night from the generator, the excess current going to the storage battery. Would it be better to charge every second or third evening from dusk until bedtime? By this method the lights would be run by the battery not over two-thirds of the time. The battery would always be nearly fully charged. Could I also charge the six-volt battery that I use on my car from the forty-five-volt ten-ampere generator?

Answer.—We believe that you will find it more economical and better for your battery to charge twice a week, or three times if necessary, running the lights direct from the generator as much as possible. To charge your small battery use the house lights for resistance and connect your battery in



series with the return circuit as shown in the figure. You will notice that two poles of the double throw switch are short circuited by the wire A, so that when the switch is in the upper position the lighting circuit is closed without charging the battery, but when in the lower position the current flows through the battery.

Coil Trouble.

I have a Model T 1914 Ford car. It ran fine until I took it to a garage. The next day it would not run. The magneto delivers plenty of current to the coil box, but that is as far as the spark can be traced. How can the coils be tested? If they are dead how can they be repaired? What causes them to go dead? If they cannot be fixed would it be best to buy an Atwater-Kent system? If the latter were used could I run my lights from the magneto? How would the lights be wired?

Answer.—The chances are that the coils are all right. Some curious and ignorant person has probably been meddling with the contact screws that adjust the vibrator points on top of each coil. Having these readjusted will probably end the trouble. There is also a chance that something is wrong with the switch or the timer. In case your coils are bad, which is very doubtful, it would be a matter of personal choice as to installing an Atwater-Kent system. With that system you could use your magneto for lights. The wiring is very simple. Run a wire from the magneto to the light switch on the dash, from the switch to one of the lamps, from one lamp to the other, from the second lamp run a ground wire to the frame or motor. Use six-volt twelve-candle-power tungsten lights. If you have trouble with the lights burning out use eight-volt lights.

Charging Capacity of Motor.

I have a Knapp dynamo motor whose safe maximum load is six volts four amperes. It generates eight volts at 3,000 R. P. M. Will it charge a six-volt sixty-ampere storage battery?

Answer.—In order to give the battery a complete charge the generator would have to generate at least eight volts. The generator is rather small for the battery. It would probably give the battery a complete charge in about twenty hours, running at 3,000 R. P. M. The machine would not last well under such an overload.

Galvanizing.

How can I galvanize a small piece of iron?

Answer.—Clean the iron so that it is free from rust, scale or grease. This is usually done by pickling in dilute muriatic acid or polishing with emery cloth. Then dip the iron in molten zinc.

A NEW WORLD CHAMPION.

The Four-Year-Old Holstein Cow, Ormsby Jane Segis Aaggie, is Now Champion Over All Classes and Breeds.

THERE is a new queen of the dairy world. She is owned by Mr. Oliver Cabana, Jr., of Buffalo, N. Y., owner of the Pine Grove Farms, at Elma Center, N. Y., near Buffalo.

She is a pure-bred Holstein cow, almost entirely white in color, as shown by her photograph, which we reproduce in this issue. She is a senior four-year-old heifer and her name is Ormsby Jane Segis Aaggie 150934 and her brief history can well be taken as an object lesson and as an incentive to farmers and stockmen generally to persist in the development of their cattle.

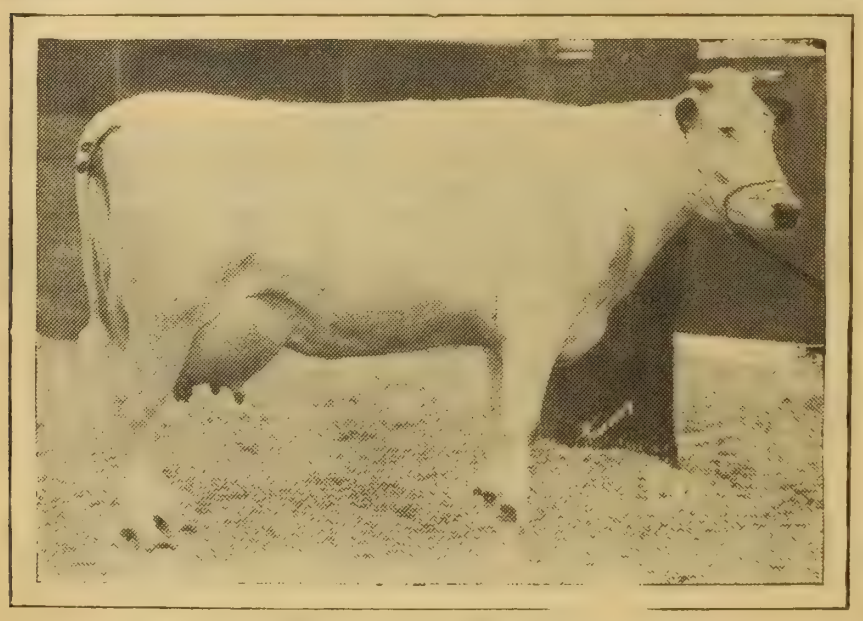
Mr. Cabana, her owner, has recently come into prominence by establishing the Pine Grove Farms and stocking them with the very best Holstein cattle obtainable at the various sales.

Last January he purchased sixteen animals at the Dollar Dispersion Sale, at Syracuse, N. Y., the cream of the entire herd, paying nearly $60,000.00 for the sixteen head, one of the number being the noted bull, Rag Apple Korndyke 8th, said to be the greatest Holstein bull in the world, for which Mr. Cabana paid $25,000.00, this being the highest price ever paid for a bull in public sale.

Ormsby Jane Segis Aaggie, the new world's champion, was purchased by Mr. Cabana over two years ago, when a young heifer, paying only $250.00 for her. She freshened for the first time at the age of two years and ten months; was put in official test and got a record of 17 and 24-100 pounds of butter and 437 pounds of milk in seven days.

She freshened again at the age of four years and seven days, producing a fine heifer calf by King Segis Pontiac Columbo, the junior herd sire at Pine Grove Farms. She was again tested and got a record of 22 and 94-100 pounds of butter and 535 pounds of milk in seven days.

Her next freshening was November 13, 1915, producing a fine heifer calf by Rag Apple Korndyke 8th. She was put in official test and the very first day started off at better than a thirty-pound gait for the week and continued increasing steadily until she scored the following wonderful production for a four-year-old heifer:



ORMSBY JANE SEGIS AAGGIE.

Here is her official producton:

	Butter pounds	Milk pounds
1 day	7.29	100.5
7 days	44.42	721.5
30 days	180	3,050

Not only has she beaten all records in her class as a senior four year old, but she has also beaten all world records for the full-aged class and the records were verified at different times in the test by Professor Royce, of the department of animal husbandry of New York State Agricultural College, and Prof. H. H. Wing, head of the department, who personally went to Pine Grove Farms to make a second verification test.

Individually, Ormsby Jane Segis Aaggie is the ideal dairy type. She is, therefore, champion of the world classes and breeds and unquestionably the most wonderful heifer that the world has ever known.

She is still in full official test and the above records were supervised by the New York State Agricultural College, the state official in charge being Mr. C. A. Bell, of Rochester, N. Y., and weighs about 1,500 pounds, is a fine, wedge-shaped animal, with a perfectly straight back line, and a heavy, deep body, showing great capacity. She has a perfect and highly developed, well-veined udder, one that could not possibly be improved upon. In color she is almost entirely white, having but four black spots on her body, with some black on each ear.

At Pine Grove Farms all cows are officially tested as they freshen. Thus every cow is given an opportunity of showing what she can do.

Here is a world-record cow that, as a two year old, was sold for the small sum of $250. She has since produced three calves—one bull and two heifers—all of which are owned at Pine Grove Farms and valued very highly, while she herself could not be purchased from her owner for $20,000.

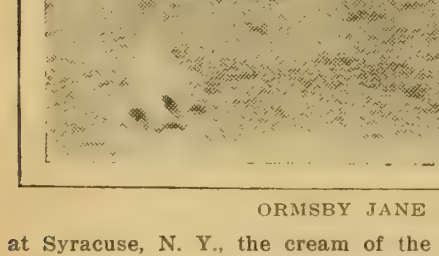
This is a good example of what persistency in the feeding, care and development of thoroughbred Holstein cattle will do. This cow and her three calves are today worth a snug little fortune.

Ormsby Jane Segis Aaggie will be continued in official test, going against all world records for a year. She will be bred to Rag Apple Korndyke 8th, the $25,000 bull and, it is said, a male calf would be worth at least $20,000.

COMMUNITY IDEAL IN DAIRYING.

Dairymen and breeders of dairy cattle have led in the plan and ideal of a community adopting one breed and specializing upon that breed. Each dairy breed has been founded and established upon that plan. Indeed, the ideal upon the islands of Jersey and Guernsey is so high that no cattle of any breed are permitted to be brought upon those islands except for immediate slaughter. With Holsteins, Ayrshires and Brown Swiss the ideals have ever been high. There has been but the one dairy breed in the locality where each has originated.

There are many advantages to the community and to individual members. Around the propositions of buying and selling hinge many of the advantages. Today many communities are starting in dairying or the residents of those communities have been netting a nice income off cows and have come to the conclusion that it would pay them to take up dairying as a business. It is plain that several men joining together may buy a carload of cows to much better advantage than each might buy a few individuals. Shipping charges and all items of expense will be less. The possibility of getting competent assistance in buying is very



The Healthy Herd

Hundreds of herds are kept in the prime of health and productiveness by the occasional use of KOW-KURE, the great cow medicine. KOW KURE has no equal in the cure of the common cow diseases of Abortion, Retained Afterbirth and Barrenness. It is also a positive cure for Bunches, Milk Fever, Scouring, Red Water and Lost Appetite.

But it is better to prevent than to cure. The periodical use of Kow-Kure in small doses will effectually prevent these diseases, and make the healthy herd pour a constant stream of profits into your pockets.

If you have a backward cow, buy a 50c package of KOW-KURE, and give according to directions. It will do wonders. 50c and $1.00 packages at all feed dealers and druggists.

Dairy Association Co.,
Lyndonville, Vt.

KOW-KURE

The smooth, rust-proof discs in the **Sanitary Milwaukee** cream separator are stamped out of one piece of pure aluminum. There is no soldering or any holes, pockets or perforations to catch and hold impurities. Every housewife knows that aluminum utensils are easier to wash because grease does not stick to them.

Not Numbered The Sanitary Milwaukee discs are interchangeable and do not have to be kept in numbered rotation. You do not have to take them off on a wire holder to keep them in any certain order. Each disc can be easily, quickly and ***thoroughly washed,*** not ***merely rinsed.*** Rinsing is not enough to keep any discs ***clean.***

Half as many Discs Besides you have only about half as many discs to keep clean. The tapered design of the discs which provides greater separating space, and proportional feed slides, which feed equal quantities of milk between each set of discs, enable the **Sanitary Milwaukee** to skim closer with less discs than any other.

SANITARY *Milwaukee* CREAM SEPARATOR

Enables you to market absolutely high-grade untainted cream, which will net you the highest prices, because you can keep every part of the **Sanitary Milwaukee** absolutely sweet and clean.

Your Separator Tested When you buy your **Sanitary Milwaukee,** you get a certificate, sworn to by a notary public, showing the exact results of the test of your particular outfit with whole milk at the factory. You ***know*** then what the separator you buy ***will do,*** not what we ***think*** it will do. We couldn't afford to furnish this sworn certificate if we weren't sure that every separator we send out will skim close.

Write now for our new catalog of the *Sanitary Milwaukee Cream Separator* and the name of dealer nearest you who can show you one.

Milwaukee Separator Mfg. Co. 245 Madison Street, Milwaukee, Wis.

Use A Wood Tire Hollow Wall Silo

Cannot Sag, Blow Down or Rot.

Cures and preserves silage perfectly. Prevents freezing of silage. Easy to construct. A real farm building, permanent and rigid. No hoops to get loose. No guy wires. No staves to shrink or swell, but a smooth, double wall from base to roof, the inner wall being of *California Redwood.*

Guaranteed for 20 Years

"But Lasts a Lifetime"

The patented wood "tire" is built up of inch boards, and shipped in sections. The boards overlap in step formation at both ends. When nailed together, these sections form a ring of unusual strength. The silo frame forms its own scaffolding.

Box 3126 Bainbridge, N. Y.

much superior. The considerations shown by breeders who have stock for sale will be very much greater.

Every community expects to have surplus stock to sell. If that community has established one breed it has many advantages in selling. A reputation may easily be built up for that community as having stock of that breed for sale. Certain districts in the United States have worked this plan so successfully that they need not be mentioned here. Those communities have sold surplus stock to the point of exhaustion when there was a plentiful supply of equally as good stock for sale in surrounding localities that could have been secured at moderate prices. The surrounding localities had not specialized and had not made any community effort. The localities that had specialized reaped the harvest. Communities that are just starting in dairying certainly have opportunity to start right by adopting one of the popular breeds and then working and advertising as a community proposition The locality will acquire a reputation for having stock of that breed. The expense of selling will be reduced and, in all probability, higher prices will be secured.

The expense incurred in maintaining high-class sires is very much reduced where there is but one breed kept in the locality. Several small herds may use the same sire instead of each keeping one. The bulls need not be retired or slaughtered after having been used two or three years in one herd. They may be exchanged or sold to another breeder in the same locality. This is especially a good practice in the case of animals that prove to be outstandingly satisfactory as sires.

The community ideal and community effort is spreading. In all parts of the country there are breeders' clubs being organized. A splendid type of club that is adaptable to almost any locality is where the members agree to use pure-bred sires of one breed and further that such pure-bred females as they may buy shall be of that breed.

MARATHON COUNTY DAIRY MEETING.

That the cheese and butter makers of Marathon county are determined to do their share towards advancing the dairy industry was clearly shown when nearly fifty representatives met at the first regular meeting of the association held at the city hall at Wausau, Tuesday afternoon, January 18th.

In the absence of Mayor Ringle, Mr. Carl G. Krueger delivered the address of welcome which rang true to the usual spirit of welcome found in Wausau. W. R. Chellis, secretary of the Wausau Advancement Association also spoke a few words of welcome to the visitors. Vice president Joseph Bergs spoke in response.

The address of the afternoon was delivered by E. I. Aderhold, of the dairy commission, on the subject "New Rules and Regulations Governing Cheese and Butter Making in Wisconsin." After enumerating some of the lines along which the improvements could be made in advancing the butter and cheese business, Mr. Aderhold took up the new rules one by one and explained not only the meaning but also the reasons for and the purpose of each. At the close of the address the committee on constitution submitted its report and the constitution was adopted. A resolution was passed indorsing the new rules and regulations and pledging the loyal support of the members in putting them into effect in the county. Plans for the future which were discussed included the holding of a picnic during the summer. It is also planned to make a feature display of butter and cheese at the Marathon County Fair at Wausau. Steps will also be taken towards the standardization of Marathon county cheese and butter. Although one of the newer counties, Marathon already has nearly ninety cheese factories and a dozen creameries, whose output the past year approximated $2,000,000. With all her natural advantages and the help of the organization to further the interests of the industry she is bound to advance rapidly to the front as a great dairy county.

The officers are: M. B. Emmerich, president; Joseph Bergs, vice president; H. H. Humphrey, secretary-treasurer.

WHERE ARE THE GREAT COWS?

To the Editor:—The everyday farmer man sometimes gets the idea into his head that there is no use for him to think of ever having cows that give large quantities of milk or those whose milk is exceptionally good. Even the idea often creeps in that the reports which are published of heavy milkers are in great measure overdrawn and away beyond the mark of truth. "I never saw a cow that could do any such thing. I never saw a man who did. I believe it is grossly exaggerated. No one ever did what we hear it said they do."

So these good farmers leave it to the men of large means to get the cows with big records. And all the while it is a fact that many of the best cows in the country are on the farms of men like the rest of us and not alone in possession of wealthy men who are simply interested in dairying as a relief from other and more difficult work.

I myself know of a cow that will do better than 1,200 pounds of butter fat, if she has no accident, this year, and she is not a millionaire's cow, nor on any government or state farm. The name and address of the commonplace farmer who owns her can be given if necessary. Four other cows that are away back out of sight of the world I can tell my readers about that have averaged over 1,000 pounds of butter fat. One of these is now being tested in the hope that she may do even better than this.

There is hope in these facts for the everyday dairy farmer. No man ought to be discouraged or think that it is beyond his reach to possess cows of great capacity. For they are absolutely within reach of us all.

I know that may seem to be a big statement, but I believe it to be true. By working through a long period of time and using the same commonsense methods that the men have who now own great cows, the rest of us may arrive at last at the same results. It cannot be done in a little while, nor by a man of weak hopes and disposition to be discouraged easily. One must dig away at it and plod and get up from many discouragements, but the returns are sure.

Suppose one has a very good cow now. He may cross that cow with a bull of known excellent qualities and get a better calf than he had. Then year after year if he works in the same way, always aiming for better blood and better breeding, he will surely astonish himself and make the world's record for great cows better. For the hope of all who are now tugging toward the top this crumb of comfort is given: In the United States today there are some 3,200,000 cows that have very nearly a record of 8,000 pounds of milk a year. And most of these cows are on the farms of real farmers.

CALVES ON SKIM MILK.

Which were the skim milk calves was the puzzle. Two lots of four calves each, one fed whole milk and the other skim milk and boiled flaxseed. The two lots looked equally sleek and thrifty. Mr. Peters, animal husbandman of the North Dakota Experiment Station, explained that the experiment was undertaken to determine how well dairy calves could be grown on skim milk.

The first three weeks both lots were fed whole milk. From then on lot No. 1 was fed eight pounds whole milk and eight pounds skim milk daily, while lot No. 2 was given sixteen pounds of skim milk and one pound of boiled flaxseed, which replaced the fat taken out in the cream. During the first three months lot No. 1 made somewhat larger gains and looked a little

Triple Wall Silos

Guaranteed not to collapse. No hoops to tighten. The permanent silo. Practically frost proof. Three walls. Regular silo staves, felt lining, Red Cypress siding. **Independent Fir Stave Silos shipped on approval.** Thousands of satisfied owners. Write for free catalog today.

Independent Silo Company,
2380 University Avenue
St. Paul, Minn.

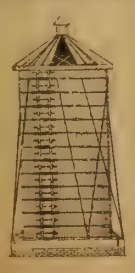
Little Ford Milking Stool
Saves milk from spilling and keeps it clean

Every milker Needs It—Pays For Itself

Just invented and patents granted. Has all the latest features and conveniences. Big improvement over any other stool. Made of strong, durable metal, aluminum painted. Fully guaranteed. Swinging pail holder, adjustable for any size pail. Pail swings out of way if cow kicks or moves. Sliding seat gives milker four inches backward or forward movement. Collapsible—can be hung on peg when not in use. **PRICE $1.50** each. Send for circular. AGENTS, this stool sells wherever demonstrated. Write for special price.

J.A.PAUL, 903 Washington St., Waterloo, Iowa

The Beaver Storm-Proof Silo



STANDS like an oak. Our eight cross rod anchor system and double angle iron inner hoops, top and bottom, together with self-adjusting hoops, make our silo non-collapsible when not in use.

For the past ten years thousands of satisfied farmers have been using the Beaver Silo. Now why aren't **you?** Write for circular "F."

more thrifty, but during the next three months lot No. 2 caught up. At six months several experienced dairy cattle breeders pronounced the calves in lot No. 2 equal to those in lot No. 1 in individual merit and dairy development. When the calves were five weeks old they were also fed clover hay and a grain ration made up of equal parts whole oats and bran. To this was added one-tenth by weight of linseed meal. It cost $19 less per head to feed the skim milk calves than those fed half whole milk to the age of six months.

REPORT OF DUNN COUNTY COW-TESTING ASSOCIATION.

Average production 807 cows 247.1 pounds per cow.

There were seventeen cows of the 807 cows that produced 400 pounds of butter fat.

There were twelve cows of the 807 cows that produced less than 100 pounds of butter fat.

There were five herds of the seventy herds that produced an average per cow per year of 355 pounds of butter fat.

The average cost of feed per cow per year in above herds was $44.66 per cow.

The net profit per cow per year in the above five herds was $69.60.

The owners of the above five herds do not intend to keep any cows that will produce less than 300 pounds of butter fat per year. These herds have been tested for years.

In the remaining sixty-five herds there are 596 cows that produced less than 300 pounds of butter fat per cow.

The five lowest herds of the seventy have an average per cow per year of 150 pounds of butter fat.

The average cost of feed per cow in the lowest five herds was $30.

The net profit per cow per year was $18 in the five lowest herds.

In seventy herds fifteen herds had an average production per cow per year of more than 300 pounds of butter fat.

The owners of these fifteen herds do not intend to keep any cows or heifers that will not produce more than 200 pounds per cow.

In the remaining fifty-five herds there were 182 cows or heifers that produced less than 200 pounds of butter fat per cow per year.

Twelve cows produced less than 100 pounds of fat per year.

Comparison of records of eight cows kept by two testers, one tester working independent at a different time each month than the other: Eight cows, record by tester No. 1, average 426.6 of fat per year. Eight cows, record by tester No. 2, average 423.8 of fat per year.

MORE PROFIT IN THICK CREAM.

Farmers will make more money by separating a reasonably thick cream than a thin cream, according to H. W. Gregory, assistant in dairy husbandry at the South Dakota State College.

He says, "Skimming high-test cream leaves more skim milk on the farm to be fed to the hogs, calves and chickens. Skim milk used in this way has a feeding value of about 30 or 35 cents a hundred, while if it remains in the cream the farmer will realize nothing from it at all.

"If a farmer is shipping cream there will also be a saving on express charges in favor of the thick cream. For example, if he had 130 pounds of cream testing 24 per cent butter fat he would have 31.2 pounds of butter fat. It would require two cans to hold the cream, one ten and one five-gallon can. Now if this cream has tested 39 per cent he would have eighty pounds of cream which could be shipped in a ten-gallon can. He would not only save the express on an extra can, but would have five gallons of skim milk left on the farm to feed.

"The buttermaker usually wants a cream testing around 35 or 40 per cent butter fat, depending somewhat on the season of the year. In the winter, if the cream is above 40 per cent it is rather difficult to get the cream all out of one can into another or into a vat and for that reason it is not advisable to skim over 38 per cent. Cream testing about 35 per cent in the winter and about 40 per cent in the summer is about right for buttermaking."

FEEDING THE DAIRY CALF.

In a sense, the care of the calf should begin before it is born. The cow which is soon to freshen should be kept in a clean, dry place, preferably a large, well-bedded box stall and should be seen by the person in charge several times each day in order that he may be there when the calf arrives or soon thereafter to see that all goes well. In most cases the calf will be able to get up and nurse within an hour after it is born, but occasionally it needs assistance. There is always a risk in allowing a cow to calve in the pasture or elsewhere without attention.

It is well to remove the calf from the cow by evening of the third day and it may be removed as soon as it has had one good nursing of the mother's milk. When the calf is weak it should be left with the cow at least a day or two. It should have the mother's milk for the first five to seven days unless the udder is diseased and the milk is bad. Her milk at this time has the proper physical effect on the calf, starting properly the action of the digestive tract. If it does well until ten days of age it will probably continue to do well, barring all accidents and poor care.

If taken from the cow early the calf usually learns to drink more quickly. At first it may be fed a small quantity of milk three times daily, though twice daily is usually sufficient. The amount of milk fed should vary from six to ten pounds (six to ten pints) daily, depending on the size and vigor of the calf and the quality (richness) of the milk. Very rich milk may be diluted with one-third as much warm water. After the calf is one week old this amount of milk may be raised to eight or twelve pounds daily; that is, two feeds of four to six pounds each. Calves which are being raised for dairy purposes need not receive more than twelve to sixteen pounds of milk per day even when changed to skim milk. If the calf is to be fattened for veal more milk should be fed.

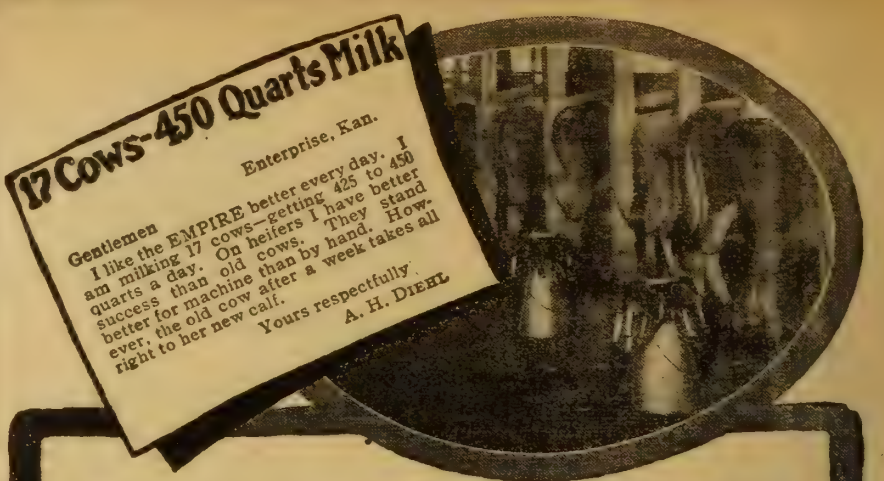
It is quite common practice for farmers who are not selling their milk to feed their calves too much skim milk. This overfeeding is the cause of much indigestion and scouring. Only warm, sweet, whole milk should be fed until the calf is two weeks of age. It is possible to begin changing to skim milk and adding other feeds at ten days of age if the calf is strong and vigorous. If the calf is not strong and vigorous the change should not be started until it is three weeks old. Better and more growthy calves will be secured if the whole milk is continued even longer than three weeks.

During the first few days and during any change in feed the condition of the calf should be watched carefully. When the change to skim milk is to be made it should be done at the rate of one-half to one pound (one-half to one pint) daily, the rapidity of the change depending on the age and vigor of the calf. The skim milk should be sweet and warmed to the same temperature as the whole milk (90 to 100 degrees Fahrenheit). The age at which the skim milk may be discontinued (the calf weaned) will depend on the condition of the calf, the supply of milk and the kind of feeds which are to take its place. It is possible to wean the calf at sixty days of age if the proper grains are substituted, but it is not desirable to make this change before the calf is four to six months of age if large, strong calves are desired. The longer the milk is continued the better will be the calf. If a number of calves are kept together they should be kept tied or in stanchions for fifteen minutes after feeding milk to prevent their sucking ears and udders. (It is claimed that sometimes bad quarters in udders of heifers at calving time are due to having been sucked when calves.)

If skim milk from a creamery is used it should be heated to 160 degrees Fahrenheit for fifteen to twenty minutes for the purpose of preventing the possibility of infection by tuberculosis or other disease germs which might be in the milk coming from other herds. The heating may also prevent scouring caused by filth germs in the milk. Sour milk, buttermilk or sour skim milk may be fed to calves six weeks to two months of age if the change is made gradually and the condition of the calf is watched closely. To teach the calf to drink give it the finger, place the hand down into the milk and gradually withdraw the finger. If it does not learn readily and is strong allow it to become very hungry and it will learn much more quickly. Care must be taken not to give it too much when hungry.

Pails in which the milk is fed should be washed after each feeding and would better be scalded or steamed. When possible they should be placed in the sun to dry, because the sun is a good germ killer. Troughs and vessels which cannot be cleaned readily are not suitable vessels in which to feed calves, because the filth germs growing in the milk and saliva left in them are very apt to cause sickness. Keep such vessels clean and dry when not in use.

Calf feeders are common on the market, but they have not given as good results as pail feeding, largely because of the difficulty of keeping them clean. Dirty vessels may make a calf sick for the same reason that a dirty bottle may make a baby sick.



Empire Mechanical Milker

The firm and gentle massage of the teats by natural atmospheric pressure coaxes the cow. She responds generously—in many cases gives even more milk than before. No compressed air used. No chance for sore, inflamed teats or udders. No dirt, germs or stable air comes in contact with the milk. One double or two-cow Empire unit takes care of 20 to 30 cows per hour. One man can attend to two double units. Everything rapid, clean, sanitary. Installation simple, easy and inexpensive. Only one tank—one pipe line. Let us send you full description and pictures of Empire Milkers and Empire Cream Separators that are making good in many fine dairies. Ask also for our offer on the Empire Gasoline Engines and Empire Star Feed Mills.

Market the Milk

Raise your calves and get the bigger money to which you are entitled. But do not feed the calf whole milk, with butter fat worth $600 a ton.

You can sell all the mother cow's milk or butter and make your calf pay you a big profit on its feed, by raising it on

RAISE YOUR CALVES WITH BLATCHFORD'S CALF MEAL

Blatchford's Calf Meal

The Recognized Milk Equal

You get 100 gallons of rich milk feed from 100 pounds of Blatchford's Calf Meal, and it costs you only one-fourth as much. It will make your calf grow fast and well.

Blatchford's Calf Meal is composed of the elements the young calf needs in the most trying period of its life; is thoroughly steam cooked—prevents bowel troubles and other ills due to improper milk substitutes.

Blatchford's Pig Meal insures quick, sturdy growth of young pigs at weaning time, without setback or falling off.

HEPSEY BURKE--A Sister to David Harum

By G. N. Wescott, the Brother of the Author of "David Harum."

(Copyright 1915.)

SYNOPSIS.

Hepsey Burke with the Junior Warden met the new pastor, Donald Maxwell, at the depot, giving him a welcome to his new parish. During the ride out to Thunder Cliff, Hepsey's home, she gave Maxwell in her outspoken way a very clear idea of the requisites or, as she put it, what the "parish wanted in the shape of a pastor." Having arrived at Thunder Cliff, Maxwell settled himself in the room assigned to him and then while resting read a letter from "Betty." After some thought he decided not to tell Mrs. Burke of her just yet.

CHAPTER III.
The Senior Warden.

"IT'S A fine morning, Mr. Maxwell," Mrs. Burke remarked at breakfast next day, "and I'm goin' to drive down to the village to do some shopping. Don't you want to go with me and pay your respects to the Senior Warden? You'll find him in his office. Then I'll meet you later, and bring you home—dead or alive!"

Maxwell laughed. "That sounds cheerful, but I should be glad to go."

"I guess you better and have it over with. He'll expect it. He's like royalty, he never calls first, and when he's at home he always has a flag on a pole in the front yard. If he's out of town for the day his man lowers the flag. I generally call when the flag's down. I wish everybody had a flag. It's mighty convenient."

The center of Durford's social, commercial and ecclesiastical life was the village green, a plot of ground on which the boys played ball, and in the middle of which was the liberty pole and the band stand. On one side of the green was a long block of stores, and on the opposite side a row of churches, side by side, five in number. There was the Meeting House, in plain gray; "The First Church of Durford," with a Greek portico in front; "The Central Church," with a boxlike tower and a slender steeple with a gilded rooster perched on top—an edifice which looked like a cross between a skating rink and a railroad station; and last of all, the Episcopal Church on the corner—a small, elongated structure, which might have been a carpenter shop but for the little cross which surmounted the front gable, and the pointed tops of the narrow windows, which were supposed to be "gothic" and to proclaim the structure to be the House of God.

Just around the corner was a little tumble-down house known as "The Rectory." The tall grass and the lowered shades indicated that it had been unoccupied for some time. Mrs. Burke called Maxwell's attention to it.

"I suppose you'll be living there some day—if you stay here long enough; though, of course, you can't keep house there alone. The place needs a lot of overhaulin'. Nickey says there's six feet of plaster off the parlor ceilin', and the cellar gets full of water when it rains, but I guess we can fix it up when the time comes. That's your cathedral, on the corner. You see, we have five churches, when we really need only one, and so we have to scrap for each other's converts to keep up the interest. We feed 'em on sandwiches, pickles and coffee every now and then to make 'em come to church. Yes, preachin' and pickles, sandwiches and salvation seem to run in the same class these days."

When they arrived in front of the block Mrs. Burke hitched her horse and left Maxwell to his own devices. He proceeded to hunt up the postoffice; and as the mail was not yet distributed, he had to wait some time, conscious of the fact that he was the center of interest to the crowd assembled in the room. Finally, when he gained access to the delivery window, he was greeted by a smile from the postmistress, a woman of uncertain age, who remarked as she handed him his letters:

"Good morning, Mr. Maxwell. Glad to meet you. I'm a Presbyterian myself, but I have always made it a point to be nice to everybody. You seem to have quite a good many correspondents, and I presume you'll be wantin' a lock box. It's so convenient. You must feel lonesome in a strange place. Drop in and see mother some day. She's got curvature of the spine, but no religious prejudices. She'll be right glad to see you, I'm sure, even though she's not 'Piscopal."

Maxwell thanked her and inquired the way to the Senior Warden's office, to which she directed him.

Three doors below the postoffice was a hallway and a flight of stairs leading up to Mr. Bascom's sanctum. As he ascended Maxwell bethought him of the Bishop's hint that this was the main stronghold for the exercise of his strategy. The Senior Warden, for some reason or other, had persistently quarreled with the clergy, or crossed them. What was the secret of his antagonism? Would he be predisposed in Maxwell's favor or prejudiced against him? He would soon discover—and he decided to let Bascom do most of the talking. Reaching the first landing, Donald knocked on a door, the upper panel of which was filled with glass painted white. On the glass in large black letters was the name, "Sylvester Bascom."

The Senior Warden sat behind a table covered with musty books and a litter of letters and papers. In his prime he had been a small man, and now, well past middle age, he looked as if he had shrunk until he was at least five sizes too small for his skin, which was sallow and loose. There was a suspicious look in his deep-set eyes, which made his hook nose all the more aggressive. He was bald, except for a few stray locks of gray hair which were brushed up from his ears over the top of his head, and evidently fastened down by some gluey cosmetic. He frowned severely as Maxwell entered, but extended a shriveled, bony hand and pointed to a chair. Then placing the tips of his fingers together in front of his chest he gazed at Donald as if he were the prisoner at the bar, and began without any preliminary welcome:

"So you are the young man who is to take charge of the church. It is always difficult for a city-bred man to adjust himself to the needs and manners of a country parish. Very difficult, Mr. Maxwell—very difficult."

Maxwell smiled as he replied:

"Yes, but that is a fault which time will remedy."

"Doubtless. Time has a way of remedying most things. But in the meantime—in the meantime, lack of tact, self-assertiveness, indiscretion on the part of a clergyman may do much harm—much harm!"

Mr. Maxwell colored slightly as he laughed and replied:

"I should imagine that you have had rather a 'mean time,' from the way you speak. Your impressions of the clergy seem to be painful."

"Well," the lawyer continued sententiously, "we have had all sorts and conditions of men, as the Prayer Book says; and the result has not always been satisfactory—not always satisfactory. But I was not consulted."

To this, Maxwell, who was somewhat nettled, replied:

"I suppose that in any case the responsibility for the success of a parish must be somewhat divided between the parson and the people. I am sure I may count on your assistance."

"Oh yes: oh yes; of course. I shall be very glad to advise you in any way I can. Prevention is better than cure. Don't hesitate to come to me for suggestions. You will doubtless be anxious to follow in the good old ways and avoid extremes. I am a firm believer in expediency. Though I was not consulted in the present appointment I may say that what we need is a man of moderate views who can adjust himself to circumstances. Tact, that is the great thing in life. I am a firm believer in tact. Our resources are limited, and a clergyman should be a self-denying man of God, contented with plain living and high thinking. No man can succeed in a country parish who seeks the loaves and fishes of the worldling. Durford is not a metropolis; we do not emulate city ways."

"No, I should imagine not," Maxwell answered.

The parson gathered that the Senior Warden felt slighted that he had not been asked by the Bishop to name his appointee, and that if he had bethought himself to sprinkle a little hay seed on his clothing his reception might have been more cordial.

At this point the door opened and a woman, hovering somewhere between twenty-five and forty, dressed in rather youthful and pronounced attire, entered, and seeing Donald exclaimed:

"Oh, papa, I did not know that you were busy with a client. Do excuse me."

Then, observing the clerical attire of the "client," she came forward, and extending her hand to Donald, exclaimed with a coy, insinuating smile:

"I am sure that you must be Mr. Maxwell. I am so glad to see you. I hope I am not interrupting professional confidences."

"Not in the least," Donald replied, as he placed a chair for her. "I am very glad to have the pleasure of meeting you, Miss Bascom."

"I heard last night that you had arrived, Mr. Maxwell, and I am sure that it is very good of you to come and see papa so soon. I hope to see you at our house before long. You know that we are in the habit of seeing a good deal of the rector, because—you will excuse my frankness—because there are so few people of culture and refinement in this town to make it pleasant for him."

"I am sure that you are very kind," Donald replied. Miss Bascom had adjusted her tortoise-sheel lorgnette, and was surveying Donald from head to foot.

"Is your wife with you?" she inquired, as one who would say: "Tell me no lies!"

"No, I am not married."

At once she was one radiant smile of welcome:

"Papa, we must do all we can to make Mr. Maxwell feel at home at Willow Bluff—so that he will not get lonesome and desert us," she added genially.

"You're very kind."

"You must come and dine with us very soon and see our place for yourself. You are staying with Mrs. Burke, I understand."

"Yes."

"How does she impress you?"

"I hardly know her well enough to form any definite opinion of her, though she has been kindness itself to me."

"Yes, she has a sharp tongue, but a kind heart; and she does a great deal of good in the village; but, poor soul! she has no sense of humor—none whatever. Then, of course, she is not in society, you know. You will find, Mr. Maxwell, that social lines are very carefully drawn in this town; there are so many grades, and one has to be careful, kou know."

"Is it so! How many people are there in the town?"

"Possibly eight or nine hundred."

"And how many of them are 'in society'?"

"Oh, I should imagine not more than twenty or thirty."

"They must be very select."

"Oh, we are; quite so."

"Don't you ever get tired of seeing the same twenty or thirty all the time? I'm afraid I am sufficiently vulgar to like a change, once in a while—somebody real common, you know."

Miss Bascom raised her lorgnette in pained surprise and gazed at Donald curiously; then she sighed and tapping her fingers with her glasses replied:

"But one has to consider the social responsibilities of one's position, you know. Many of the village people are

well enough in their way, really quite amusing as individuals; but one cannot alter social distinctions."

"I see," replied Donald, non-committally.

Virginia was beginning to think that the new rector was rather dull in his perceptions, rather gauche, but deciding to take a charitable view, she held out her hand with a beaming smile as she said:

"Remember, you are to make Willow Bluff one of your homes. We shall always be charmed to see you."

When, after their respective shoppings were completed, Maxwell rejoined Mrs. Burke, and they had started on a brisk trot towards home, she remarked:

"So you have had a visit with the Senior Warden."

"Yes, and with Miss Bascom. She came into the office while I was there."

"Hm! Well! She's one of your flock!"

"Would you call Miss Bascom one of my lambs?" asked Donald mischievously.

"Oh, that depends on where you draw the line. Don't you think she's handsome?"

"I can hardly say. What do you think about it?"

"Oh, I don't know. When she's well dressed she has a sort of style about her, but isn't it merciful that we none of us know how we really look? If we did we wouldn't risk bein' alone with ourselves five minutes without a gun."

"Is that one for Miss Bascom?"

"No, I ought not to say a word against Virginia Bascom. She's a good sort accordin' to her lights; and then, too, she is a disconnection of mine by marriage—once removed."

"How do you calculate that relationship?"

"Oh, her mother's brother married my sister. She suspected that he was guilty of incompatibility—and she proved it and got a divorce. If that don't make a disconnection of Ginty Bascom, then I don't know what does. Virginia was born in Boston, though she was brought up here. It must be terrible to be born in Boston and have to live up to it, when you spend your whole life in a place like Durford. But Ginty does her very best, though occasionally she forgets."

"You can hardly blame her for that. Memory is tricky and Boston and Durford are about as unlike as two places well could be."

"Oh, no; I don't blame her. Once she formed a club for woman's suffrage. She set out to 'form my mind'—as if any mind wasn't pretty thoroughly formed at this time of day—and get me to protest against the tyranny of the male sex. I didn't see that the male sex was troublin' her much, but I signed a petition she got up to send to the governor or somebody, asking for the right to vote. There was an opposition society that didn't want the ballot and they got up another petition."

"And you signed that one, too, I expect," laughed Donald.

"Sure thing, I did. I'm not narrow-minded, and I like to be obliging. Then she tried what she called slummin', which, as near as I can see, means walkin' in where you ain't wanted, because people are poorer than you are, and leavin' little tracts that nobody reads, and currant jelly that nobody eats, and clothes that nobody can wear. But an Irishman shied a cabbage at her head while she was tryin' to convince him that the bathtub wasn't really a coal bin, and that his mental attitude was hindside before.

"Then she got to be a Theosophist, and used to sit in her room upstairs projecting her astral body out of the window into the back yard, and pulling it in again like a ball on a rubber string—just for practice, you know. But that attack didn't last long."

"She seems to be a very versatile young woman, but she doesn't stick to one thing very long."

"A rolling stone gathers no moss, you know," Mrs. Burke replied. "That's one of the advantages of bein' a rolling stone. It must be awful to get mossy, and there isn't any moss on Virginia Bascom, whatever faults she may have—not a moss."

For a moment Mrs. Burke was silent, and then she began:

"Once Virginia got to climbin' her family tree, to find out where her ancestors came from. She thought that possibly they might be noblemen. But I guess there wasn't very much doin' up the tree until she got down to New York, and paid a man to tell her. She brought back an illuminated coat of arms with a lion rampantin' on top, but she was the same old Virginia still. What do I care about my ancestors! It doesn't make no difference to me. I'm just myself anyway, no matter how you figure, and I'm a lot more worried about where I'm goin' to than where I came from. Virginia's got a book called, 'Who's Who,' that she's always studying. But the only thing that matters, it seems to me, is Who's What."

"I wonder she hasn't married," remarked Donald, innocently.

"Ah, that's the trouble. She's like a thousand others without no special occupation in life. She's wastin' a lot of bottled up interest and sympathy on foolish things. If she'd married and had seven babies they would have seen to it that she didn't make a fool of herself. However, it isn't her fault. She's volunteered to act as Deaconess to every unmarried parson we've had, and it's a miracle of wonders one of 'em didn't succumb, parsons are such—oh, do excuse me! I mean so injudicious on the subject of matrimony."

"But, Mrs. Burke, don't you think a clergyman ought to be a married man?"

"Well, to tell you the truth, t'aint me that's been doin' the thinkin' along those lines, for most of the parsons we've had. I've been more of a first aid to the injured, in the matrimonial troubles of our parish, and the Lord only knows when love-making has got as far as actual injury to the parties engaged—well thinkin' ain't much use. But there's Ginty, for example. She's been worryin' herself thin for the last five years doin' matrimonial equations for the clergy. She's a firm believer in the virtue of patience, and if the Lord only keeps on sendin' us unmarried rectors Ginty is goin' to have her day. It's just naturally bound to come. I ain't sure whether she's got a right to be still runnin' with the lambs or not, but that don't matter much—old maids will rush in where angels fear to tread."

Maxwell smiled. "Old maids and old bachelors are pretty much alike. I know a few of the latter that no woman on earth could make into regular human beings."

"Oh, yes; old bachelors aren't the nicest thing the Lord ever made. Most of 'em are mighty selfish critters, take 'em as they run; and a man that's never had a real great love in his life doesn't know what life is."

"That's quite true," Donald responded, with such warmth that Mrs. Burke glanced at him suspiciously, and changed her tune, as she continued:

"Seems to me a parson, or any other man, is very foolish to marry before he can support a wife comfortably, and lay by somethin' for a rainy day, though. The last rector had five babies and seventeen cents to feed 'em with. Yes, there were little olive branches on all four sides of the table and under the table, too. The Whittimores seemed to have their quiver full of 'em, as the psalmist says. Mrs. Whittimore used to say to me, 'The Lord will provide,'—just to keep her courage up, poor thing! Well, I suppose the Lord did provide, but I had to do a lot of hustlin', just the same. No sir, if a person marries, he better find a woman who has outgrown her short skirts. Young things dyin' to be martyrs with a good lookin' young parson, are a drug in the market. Better go slow." And Hepsey looked up at him significantly.

"Then you think it would be inadvisible to propose to Miss Virginia immediately, do you?" Donald asked, as if humbly seeking guidance.

"Well, there doesn't seem to be any immediate hurry about it. Now if you'll open the gate to Thunder Cliff I'll be much obliged to you. If I don't get my mind on something less romantic than Virginia we shall have to dine off airy fancies—and that won't suit Nickey, for one."

(To be continued.)

A PREMO CAMERA

Is a Necessity--Not a Luxury

This camera is made by the Eastman Kodak Co., is of the box type, with universal focus lens, the simplest instrument for picture-making that can be devised. It will produce excellent results in the hands of anyone; no experience necessary. Film pack used, daylight loading. Pictures 1 1-4 x 3 1-4. Booklet of instructions included with each camera.

HAVE YOU ALWAYS REGARDED A CAMERA AS MERELY A "PLAY-THING?"

What do you raise?

Fruits? Livestock? Grain? Flowers?

It doesn't matter--whatever it is, you raise it to sell, don't you? Now, how much better than "telling" distant prospective customers what you have, is ***showing*** them! You can't bring them to your farm, but pictures will get practically the same result. One picture tells more than pages of words.

What better way of keeping a record of growth, than by pictures?

A Picture of old Dobbin with Baby on his back, will be priceless twenty years from now.

HERE'S HOW YOU CAN GET A CAMERA--

Given with The Housewife for one year at $1.80. Cameras sent postpaid, delivery guaranteed.

THE WOMEN WHO WANT TO VOTE.

There no longer remains much doubt as to the attitude the women themselves are taking on the equal suffrage question, despite the fact that the belief is entered by some persons that women generally do not want to vote. "Facts is facts," and this holds good in the stand taken by the women of the United States concerning the suffrage question. Many millions of women have gone on record as wanting to vote, and there is hardly a woman's organization of prominence which is not in favor of equal suffrage.

Here are a few of the country's women who want to vote:

International Council of Women, representing 7,000,000 women.
National Federation of Women's clubs, membership more than 1,600,000.
Every state federation of women's clubs in the states where women have the right to vote, and many in states where the right of suffrage is denied women.
National Women's Trade League, with a membership of twenty-two leagues in thirteen different states.
National Order of Maccabees, 50,000 women.
International Council of Nurses, representing nine countries, and including the United States.

And here are some of the organizations which say women are entitled to the ballot:

National Educational Association.
National Grange.
American Federation of Labor.
United Commercial Travelers, grand council.
National Association of Letter Carriers.
National Purity Conference.
National Miners' Federation.

In face of this support can men and women question the lack of interest on the part of the women themselves, or the lack of approval on the part of the men who are doing things?

WANTS TO KNOW DIFFERENCE IN CREEDS.

To the Editor:—I wonder if some of your readers will not answer some questions which no doubt will interest others as well as myself.

When attending church one is always urged to unite therewith, but never yet have I had any opportunity to learn the creed (if that is the correct word) of the different churches. Would be thankful to know what is expected of a person joining the Presbyterian, also the Methodist Episcopal church. What is the difference between them? Why is one a Christian and more likely to be saved after uniting with a church than when living an honest, conscientious life out of the church? Constant Reader.

NOW IT'S TWINS.

To the Editor:—So many mothers have sent their babies' pictures in that I thought I would take time to send ours. I have never seen any pictures of twins in the paper. Our babies are twin girls, May and Eva Rockwell. At the time this picture was taken they were one year old and weighed eighteen and twenty pounds. They are nineteen months old now. They only weighed three and five pounds when they were born. I brought them up on cow's milk and they have always been well.

I hope to hear from more mothers through the paper. I enjoy reading their letters very much.

Mrs. C. M. Rockwell.

HOW TO MAKE A GOOD BUTTONHOLE.

Buttonholes are a stumbling block to many an otherwise good sewer. A garment may be neatly made, fit well, and be a work of art in every other respect, but its beauty will be spoiled entirely if the buttonholes gap open or break through at the end, leaving a slit twice as great as the diameter of the button.

To make a good buttonhole, begin the slit about a quarter of an inch in from the edge. Cut on a thread through both or all thicknesses of the cloth, making the slit the length of the diameter of the button to be used. Use a thread a little heavier than the cloth in which the buttonhole is worked and of sufficient length to complete it. The needle should be as fine as will carry the thread.

In working a buttonhole, first put in two or more stitches across the lower end of the slit to keep it from stretching. Then take two or more stitches down the side, across the end and up the other side, a sixteenth of an inch from the edge, bringing the needle out at the starting point. This will strengthen the buttonhole. In overcasting the edges, sink the stitch a thread beyond this stranding. Four or five overcasting stitches on each side are sufficient to prevent raveling and to keep the strands in place. The last stitch in overcasting should bring the needle out at the end of the slit ready to begin working the buttonhole.

In taking the buttonhole stitch, the needle should be brought through towards the worker, deep enough to cover all stitches that have been made before and prevent pulling out. Before pulling through, make the buttonhole purl by taking the thread over the eye of the needle and carrying it around the point of the needle in the direction in which you are sewing. When the end is reached take seven or nine spreading stitches, making a fan, if a rounded end is desired. Continue down the other side. If a bar is used put the needle into the opposite purl at the end of the slit, draw the two sides together and make several long stitches the length of the width that the buttonhole is cut. Work the bar across the end, work-

ing from left to right with the blanket stitch. Finish by taking a few tiny stitches on the wrong side.

DAISY YOKE.

So many of our friends have written us for further details in the crocheting of the daisy yoke illustrated some time ago in the Home Department that we are printing directions for this yoke herewith in a little different form and making as many explanations of stitches as possible. The yoke is made of No. 30 cotton.

Ist Row — *Chain eleven, two double trebles (thread over twice) in fourth chain from hook; chain four, three double trebles in fourth stitch from hook; chain three, slip stitch (put hook through work at stitch indicated in directions, draw thread through work and loop on needle at same time) in same hole; chain three, three double trebles, chain three, one slip stitch in same hole; chain three, three double trebles; chain three, one slip stitch in same hole; chain three, one double treble in same place and slip stitch in top of first double treble, thus forming one flower. Chain seven, slip stitch in first of eleven chain. Do not turn work.

2d Row—Chain nine, two double trebles in fourth chain from hook; chain four, two double trebles in fourth chain from hook, withdraw hook, pull through third chain from top of leaf; one double treble in same hole; chain three, one slip stitch in same hole; chain three, two double trebles in same hole; chain two, slip stitch in center of leaf of last row; chain six, two double trebles in fourth chain from hook; chain four, three double trebles in fourth chain from hook; chain three, one slip stitch in same hole; chain three, three double trebles; chain three, one slip stitch in same hole; chain three, three double trebles; chain three, one slip stitch in same hole; chain three, one double treble in same hole and slip stitch in beginning of flower; chain five, slip stitch into end of partly worked flower; one double treble; chain three, one single crochet into center hole of flower; chain three, three double treble; chain three, one single crochet in same hole; chain three, one double treble, slip stitch into top of flower. Repeat in the same manner from * until the desired width is reached, then decrease to form the other half of scallop.

TRY IT YOURSELF.

After corks have been used awhile they sometimes become so compressed that the contents of the bottle leaks out. This may be remedied by putting the corks in boiling water and leaving them until the water cools. They will then be as good as new and fit just as tightly.

The turkey or chicken need not be sewed up after the dressing has been put in. Insert toothpicks on either side and string back and forth over the picks. This is easily removed after the fowl is cooked.

Rusty flatirons should be rubbed over with beeswax and lard or beeswax and salt.

It should be a matter of common knowledge, since flour is always within convenient reach, that wheaten flour is the best extinguisher to throw over a fire caused by the spilling and igniting of kerosene.

When stoves are about to be put away for the summer, apply kerosene to them with a cloth; it will prevent rust.

Use sandpaper to remove spots of rust from your range.

Dark calicoes should be ironed on the wrong side with irons that are not too hot.

After using your meat grinder run a piece of dry bread through it. It will take out all the grease and make it easy to wash.

Sugar for cakes should always be sifted. Never melt the butter; creaming butter encloses air and makes the cakes light; cakes should always be beaten—not stirred.

MODIFIED MILK FORMULA FOR THE BABY.

To the Editor:—I have seen through the columns of your paper that you are wanting mothers to write to your Home Department. I am sending a picture of our eleven-months-old baby boy, weight twenty-eight pounds.

He has been an artificially fed baby since he was seven weeks old and is perfectly healthy and well. While I do not think artificial feeding is best, it is often the case that a baby must be fed from the bottle.

I advise cow's milk when it can be obtained, and will give the formula I have used with much success. In preparing cow's milk for children's use it should be strained through several thicknesses of cheesecloth into glass jars or milk bottles, which should be covered and cooled immediately. I have always used a half gallon fruit jar and filled it every morning with fresh milk and let it stand in ice water up to its neck for two and a half hours. Then I would take the top third and put two-thirds water with it, one ounce of limewater and one ounce of milk sugar. The milk sugar should be prepared by dissolving in warm or boiling water, and it should be filtered, after boiling, through two thicknesses of cheesecloth.

RAY M. STANLEY, AGE 11 MONTHS.

This amount will probably last baby for twenty-four hours, but I always made fresh milk every morning in cool weather and morning and evening in hot weather.

After the child is three or four months old the amount of cream to be added to the milk can be increased considerably. This will be done by adding one-quarter the bulk of cream to the milk. It is best to feed this formula until the child is ten or eleven months old.

Hoping this will be of benefit to some mother. Mrs. Selby Stanley.

The Quaker Says:—

"Put Thy Faith in Lewis'"

He knows that the lye with the reputation is the lye that discriminating housewives should select, for general cleaning about the house, for water softening, for making soap.

About making soap—do you realize that home-made soap is easy to make and an extraordinary economy? Would you like to save money? Soap made at home with

Lewis' Lye
The Standard for More Than Half a Century

costs less than half as much as the cheapest commercial soaps and it gives perfect cleansing results.

Lewis' Lye entirely saponifies the grease in home-made soap. It *always* does it because it is *always* the same. Every can of Lewis' Lye is of the same superior quality as every other can—always and anywhere.

Ask your mother. The chances are she used it when she was a girl and does yet.

RECIPES.

Lamb Souffle.—Cook one tablespoonful of butter with one of flour. Add three-fourths of a cupful of rich milk or stock. When boiling add one cupful of finely minced chicken or mutton with one-half cupful of soft bread crumbs and three beaten yolks. Season with salt and pepper and a little Worcestershire sauce. Add a little minced pimento if there is any at hand.

Bread Omelet.—Break dry bread in pieces, pour over it hot water until real moist, season with salt, pepper and butter. Beat in one egg to each small slice of bread. Have pork fryings hot in skillet, pour the mixture in. Fold in the beaten whites and turn into a deep buttered dish. Bake in a slow oven for twenty minutes. Serve at once. When brown underneath cut as you would pie, turn and brown the other side. This is excellent.—Mrs. L. A. I.

Coffee Cake from Heidelberg.—One cup sugar, one-half cup butter and lard mixed, one egg, one cup milk, two and one-half cups flour, two teaspoonfuls baking powder, one-half cup currants. Pour into a large, flat bread pan and sprinkle with sugar and ground cinnamon. Bake twenty minutes. Serve hot with butter and coffee.

Brown Bread.—One-half cup of honey, one and one-half cups of sour milk or buttermilk, three cups of graham flour, one teaspoonful of soda. Nuts and raisins may be added if desired.

Apples and Rice.—Pare and core apples, place in a baking dish and fill the holes with chopped raisins and sugar. Fill the space between the apples with rice that has been boiled fifteen minutes. Cover and bake fifteen minutes. Remove cover and bake fifteen minutes longer. Serve hot with cream.

Jellied Apples.—Twelve apples, one lemon, one and one-half pounds sugar, one ounce gelatine. Pare and core apples. Cook in water enough to cover them, until they can be pierced with a straw. Remove them and add sugar to water. Boil five minutes. Then put apples in and cook until clear—about fifteen or twenty minutes. Take apples out and add sliced lemon and the gelatine, which has been dissolved in cold water. Let come to a boil and pour over apples. Set away to harden. Serve cold with cream.

Orange Cake.—One-fourth cup butter, one scant cup sugar, one-half cup milk, whites of two eggs, two and one-half cups pastry flour, two teaspoonfuls baking powder. Flavor with orange extract. Sift flour with baking powder three times and mix in the order given. Bake in two shallow pans about twenty minutes. When cool put together with orange filling.

Orange Filling.—One-half cup sugar, two small tablespoonfuls flour, a little grated orange rind, one-half cup orange juice (one orange), one-half teaspoonful lemon juice, one teaspoonful butter, one egg, beaten slightly. Mix in order given, beat up well and cook in a double boiler, stirring constantly until thick as thin mush. When cool it is ready for use.

Indoor Closet

More Comfortable Healthful and Convenient than the Out-Door Privy

Eliminates the open vault and cesspool, breeding places for germs. Have a warm, sanitary, odorless toilet right in your house. No going out in cold weather. A boon to invalids. Endorsed by State Boards of Health.

THE YOUNG FOLKS

All letters from boys and girls to this department should be sent to office of The Wisconsin Farmer, Madison, Wisconsin.

THE KING OF THE GOLDEN MOUNTAIN.

A certain merchant had two children whom he loved dearly. For several years he was wealthy and prosperous, and then one day he got word that some of his ships had been lost at sea. In these two ships he had put all of his property in the hope that he would make great gains. So when they were lost he was left without anything.

One day he met a little rough looking dwarf, who said to him:

"Tell me what makes you so sad."

So the merchant told him his troubles. When he was through the dwarf said to him:

"I will give you gold and great riches if, at the end of twelve years, you will promise to give me the first thing that runs to meet you on your return home today."

And the merchant, thinking, of course, that his dog or his cat would run out to greet him, promised.

Imagine his surprise and grief then, upon arriving at home, to have his little son run to meet him. However, the father did not worry about the bargain long, for he had not yet received anything from the dwarf. But one day when he went up into the garret he found a great pile of gold, which he took and started into trade again and was soon a rich man.

In spite of his wealth the father began to grow sad as the end of the twelve years drew near. At length his son asked what was the matter and the father told the boy of the bargain with the dwarf.

So they went into the forest and after a while the dwarf came. Then the son learned that he actually belonged to the little man. It was agreed that the boy was to be put into a boat and set adrift on the sea.

However, the boat went sailing on until it was washed onto the shore of a strange island. Here the boy got out and started to explore the place. He could find no living person or thing in the wood that covered the island. Finally he came to a beautiful castle that was enchanted. Going in, he went from room to room and the only thing he could find was a white serpent. This serpent was an enchanted princess and she told the boy: "I have been waiting here for you for twelve years. If you will deliver me from this enchantment you must stay in the castle two nights. On the first night twelve black men will come. They will stay until twelve o'clock and then depart. All that you must remember is not to speak a word while they are here. On the second night they will come again and you are to act in the same manner. Only on the second night they will cut off your head. But at midnight when they depart my enchantment will be done away with and I will get the water of life and restore you."

Everything happened as the princess had said and after she had been changed back into a beautiful lady the boy married her. Then he became King of the Golden Mountain. They lived happily for several years and had one little son. One day the king thought of his father who had been sorrowing for him so long.

The queen did not want him to go back to his old home, but when she saw he was determined to do so she gave him a wishing ring with this instruction: "Put this on your finger. It will bring you any wish, but do not use it to wish me or our son away from this place."

Dressed in shepherd's clothing the king started for his father's home. He told them about being a king and of his wife and child. But the father and mother laughed at this and said: "You a king and in those peasant clothes!"

That made the king so angry that he forgot what his wife had said and wished that she and his son were there. Instantly they appeared and proved what he had told his parents. But the queen was weeping, saying that some misfortune would surely happen.

The king was so disappointed with his father and mother for the way they had treated him that he started home with his wife and son. They came to the place where he had started off in the boat so many years before. As he was very tired, the king lay down to sleep for a while, and when he was asleep the queen took the wishing ring off his finger and in revenge wished herself and her son back at the castle.

When the king awoke he started out to follow her. On his way he passed a mountain where seven giants were quarreling over an inheritance of three things. They could not decide how to divide their possessions and so they called to the king.

Now the three things were a cloak that made the wearer invisible, a sword that would cut off the head of everyone in sight except the owner if he but shouted "Heads off," and boots that would transport the wearer immediately wherever he wished to go. The king put on the cloak and the boots, but the giants would not give

him the sword until he promised not to say, "Heads off."

As soon as they gave him the sword the king wished that he was back in his own kingdom. Immediately he stood in front of the castle, which was all lighted up and from which sounds of music and merriment issued. The king asked what was happening and found that the queen was about to celebrate her second marriage.

Made invisible by his cloak, the king followed his wife wherever she went. In the dining room he ate the food off her plate, so that no matter how much she was served her plate was always empty. At last frightened and remorseful, she went to her room and moaned:

"Did not my deliverer come? Why does enchantment still follow me?"

"Your deliverer did indeed come," said the king bitterly, "and is here now. Does he deserve such treatment from you?"

Then he went down where the guests were and declared himself the king. The servants were going to throw him out and he shouted "Heads off," and the traitors fell before him. He was once again King of the Golden Mountain.

OUR FASHION DEPARTMENT.

ALL PATTERNS, 10 Cents Each.

THIS department is prepared especially for The Wisconsin Farmer. We can supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10 cents each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering, all you have to do is to write your name and address plainly, tell us the correct number and size of each pattern you want and inclose 10 cents for each number. We agree to fill all orders promptly and guarantee safe delivery. Address all orders to The Wisconsin Farmer, Madison, Wis.

7552 Ladies' Waist.—Cut in sizes 34 to 42 inches bust measure. This plain waist may be used for soft materials, such as silk, charmeuse and crepe de chine. Linen, madras or taffeta are also suitable. The collar may be buttoned high or rolled low.

7548 Ladies' Skirt.—Cut in sizes 22 to 32 inches waist measure. This skirt can be made up in serge, gabardine or broadcloth. It is cut in three gores and has a plaited section on the left side. High or regulation waistline may be used.

7582 Boys' Blouse.—Cut in sizes 8, 10, 12, 14 and 16 years. Percale, flannel, madras and similar materials are used for these blouses. This blouse has a center front closing and plain sleeves with small cuff ending. The collar is removable.

7549 Boys' Overcoat.—Cut in sizes 2, 4 and 6 years. Every boy needs an overcoat and here is an excellent pattern for making such a garment. The coat is very simple to make. The closing may be single or double breasted.

7538 Girls' Dress.—Cut in sizes 4, 6, 8, 10 and 12 years. Linen, gingham or serge can be used for this dress with the trimming bands of contrasting or plain material. The dress closes at the front and may have either long or short sleeves. The skirt has three gores.

7539 Ladies' Maternity Dress.—Cut in sizes 34 to 42 inches bust measure. Any of the pretty flowered woolen materials can be used to make this dress with the collar and cuffs of plain material. The dress has the Empire waistline with front closing. Long or short sleeves may be used.

7253 Girls' Middy Dress.—Cut in sizes 6, 8, 10 and 12 years. Brought up to date this dress has a separate skirt, with panel front and side plaits from this to the panel back. The blouse has only the usual short opening at the neck, slipping on over the head.

7535 Ladies' Dress.—Cut in sizes 34 to 42 inches bust measure. Linen, serge or broadcloth can be used to make this plain and practical dress with the trimming of plain or contrasting material. Body and sleeve sections are in one and the skirt has four gores.

7258 Children's Rompers.—Cut in sizes 2, 4 and 6 years. In these simple rompers there is no division at the waistline in front, as half the body and half the leg sections are cut in one piece. The closing is in the center of the front. In the back the body section is seamless.

6725 Ladies' Apron and Cap.—Cut in sibes 36, 40 and 44 inches bust measure. Modified kimono lines are used in this apron which is quite loose and hangs in sacque fashion from shoulder to hem. There is a seam along the shoulder and down the outside of the sleeve.

Price of any of these patterns 10 cents each.

International Sunday School Lesson

Lesson for February 6, 1916

(By E. O. SELLERS, Acting Director of Sunday School Course.)

BOLDNESS OF PETER AND JOHN.

LESSON TEXT—Acts 4:1-31.

GOLDEN TEXT—Watch ye, stand fast in the faith, quit ye like men, be strong.—I Cor. 16:13.

The first seven chapters of the book of Acts have been designated as the Jerusalem period. Chapter 1 deals with the ascension of our Lord; chapter 2, the baptism of the Holy Spirit; chapters 3-7, the early conflicts in Jerusalem. In our lesson of last Sunday we had the story of Peter and John dealing with the lame man while on their way to the temple. Following this experience they were imprisoned, the first imprisonment mentioned for any of those who accepted the Gospel. As the disciples were dealing with the multitude the rulers of the temple came upon them and were much put out (v. 2) that the disciples should preach the resurrection of Jesus from the dead. The significance of this is better understood when we remember that the Jewish Sanhedrin was the great court of Jewish law composed of seventy-one leading men of the nation. Caiaphas, the noble high priest by Roman appointment, and Annas, the real high priest according to Jewish law, were both there. This body was largely made up of the Sadducees, the sect which did not believe in the resurrection from the dead.

I. The Imprisonment, vv. 1-4. Peter and John being brought before this tribunal were fulfilling literally the prediction of Jesus (Matt. 10:17). The attempt on the part of the rulers to prevent the preaching of the Gospel by this method really augmented its being heard throughout the nation. Peter had seen this body of men on the night when our Lord was condemned.

II. The Trial, vv. 5-22. (1) Peter's words vv. 5-12. Jewish wonder-workers were accustomed to perform marvels by the use of some name, so the council very naturally asked Peter and John "In what name" they had healed this man. The real object of their question was their attempt to entrap the disciples and find a basis of accusation and condemnation. But at that moment the Holy Spirit came again upon Peter and filled him (Matt. 10:19, 20; also Luke 12:11, 12; Acts 13:8, 9). The coming of the Holy Spirit is for every emergency of the Christian. Peter had been filled with that Spirit at Pentecost and was again filled a little later on (chapter 2:31). Thus we see that the coming of the Spirit is not once for all, though Pentecost was once for all, but that the filling is repeated as each new emergency may arise. (a) Peter acknowledged the authority of those who were dealing with him (v. 8), but (b) he gave Jesus credit (v. 10). It was Jesus who had died, he who had risen, and the risen Christ had effected this miracle. (c) Turning upon his accusers Peter charged them with the death of Jesus. He (v. 11) is the foundation of this miracle and their faith. Peter claimed that in Jesus alone (v. 12) could salvation be found, and implied (see last clause of this verse) that his accusers were lost men. Peter's deportment in all of this is wonderfully skilful, gentle and courteous, yet bold, fearless, frank and outspoken. We need to remember this when we recall how blunderingly Peter had conducted his conver-

lation before his enduement by the Holy Spirit. There was no compromising of the truth and no glossing over their guilt.

III. The Result Upon the Disciples, vv. 19-22. The book of Acts is plainly the record of the deft utterances of spiritual men. Peter had closed his appeal (v. 12) with the statement that the only way we could be saved must be through this means. The council were in a dilemma; they wanted to punish Peter and John, but could not, for the people were glorifying God for what had been done. Peter and John declared thus fearlessly that the teachings of the schools was not in accordance with that, for had not Jesus risen, and had not this miracle been performed? The Holy Ghost's boldness in these untutored men has always been a perplexity to the scholastics of the world. Their boldness was due to a sense of God's nearness and carried with it a like sense of their responsibility to him (see vv. 19, 20).

The only solution on the part of the people and of the priests was they took knowledge that "these men have been with Jesus." Tmhis is the solution of many mysteries of today.

Companionship with Jesus makes ordinary men extraordinary.

The Sanhedrin asked, "What shall we do with these men?"

A better question would have been, "What shall we do to be saved?"

IV. The Early Church, vv. 23-27. Six points about that church: (1) It was a praying church (vv. 24-30); (2) It was a Spirit-filled church (v. 31); (3) It was a united church (v. 32); (4) It was a witnessing church (v. 33); (5) It was a ministering church (vv. 34, 35); (6) It was a multiplying church, (vv. 36 and 37) for there were many converts added.

THE SHEBOYGAN SHOW.

The Sheboygan Poultry and Pet Stock Association had a good show this year with 600 birds and about 500 pigeons, according to George L. Spratt, secretary. About $450 in cash premiums was paid out. The birds, as a rule, were of good quality, indicating greater attention to the raising of pure breds in Sheboygan county. Among the big winners were George W. Schmitt and Robert Roberts, both of Sheboygan county. Schmitt is a breeder of S. C. White Leghorns and Roberts of S. C. Black Orpingtons. The Twin Lofts pigeon exhibit captured a majority of the prizes. Arthur Quade, of West Bend, entered thirty-six ducks and twenty-four geese and captured a large number of prizes. He also swept the field in the Bantam classes and carried home a number of special prizes and several cups. Mr. Robert H. Roberts, of Sheboygan, had seventy-nine birds entered.

40 NEW SUNSHINE POST CARDS.

WITH OUR ADVERTISERS.

"Purity Brand" Seeds Give Satisfaction.

THE Adams Seed Co., Decorah, Iowa, has built up its big business in "Purity Brands" on the basis of absolute reliability and square dealing. In hundreds of farm homes "Purity Brand" means seed dependability. All their seeds are sold on their absolute guarantee of their purity and germination, subject to the buyer's test and inspection, with money cheerfully refunded if not found to be all and more than is claimed for them. Samples and prices will be sent free if you will write to The Adams Seed Co., Box 50, Decorah, Iowa, and mention their advertisement on page 25.—Adv.

Zyro Metal Silos Are Well Built.

THE makers of Zyro metal silos are offering a free book which tells all about the advantages of silos built of pure galvanized iron, which is said to be especially efficient in keeping the silage sweet. They are air tight, do not shrink or warp, are storm, lightning, vermin and rust proof and do not require hoops or anchor wires. They are ornamental, too, and their cost of upkeep is very small. They are made by the manufacturers of the famous Zyro corn cribs and grain bins and have the same careful construction that has made these other products so satisfactory. Write to The Canton Culvert & Silo Co., Box 214, Canton, Ohio, for their book and mention their advertisement on page 33, when writing.—Adv.

"Successful" Incubators Insure Success.

J. S. GILCREST, president of the Des Moines Incubator Co., is advertising on page 23 what he says is the best offer he has made in twenty-one years of successful experience as maker of "Successful" incubators and brooders. Every buyer of these incubators gets a free course of lessons in successful poultry raising that gives him the best possible preparation for making the largest profits out of the poultry business. He is also offering their "Successful" grain sprouters, which turn a bushel of oats into three bushels of fresh, egg-making feed that is a sure egg producer in winter. A free catalog will be sent upon request and, for ten cents additional, a copy of their valuable booklet, "Proper Care and Feeding of Chicks, Ducks and Turkeys," will also be mailed you. In replying to their advertisement on page 23 address Des Moines Incubator Co., 380 Second St., Des Moines, Iowa, and please refer to this paper.—Adv.

Ironclad Incubator Hatched 100 Per Cent.

IN one of the biggest hatching contests ever held an Ironclad incubator won with 148 chicks from 148 eggs. This is the same machine which is offered on page 20, together with the Ironclad brooder, for only $10. Both are substantially made, with the finest, most improved construction and best materials. They are sold on thirty days' free trial, with freight prepaid east of the Rockies. After reading the specifications as set out in their advertisement, write for their catalog, addressing Ironclad Incubator Co., Box 113, Racine, Wis., and kindly mention this paper.—Adv.

Radio-Round Incubators Built Nature's Way.

RADIO-ROUND incubators follow nature in providing a round egg chamber, exactly like a nest, and a mild, moist heat by means of a built-in moisture system and triple center heater. It has a hinged cover with glass panels and is said to operate on only three minutes' care a day, hatching from a single filling of oil. For further description and freight-prepaid proposition address Radio-Round Incubator Co., Drawer 9, Wayne, Neb. See page 21.—Adv.

Agents Wanted for New Improved Silo.

TABER lined silos are made of wood staves of choicest material, with a special paint for the outside and an acid-proof lining for the inside, to be put on after erection. The entire silo is well creosoted and is non-shrinkable, practically everlasting, rot proof, storm proof, worm proof and acid proof. It has an especially good door and door frame and is topped by a galvanized steel octagon roof which is perfectly adapted to the purpose. Agents are wanted to handle this latest development in silo construction. For further information address Taber Lumber Co., Keokuk, Iowa, and please mention their advertisement on page 34.—Adv.

Papec Ensilage Cutters Save Time and Money.

PAPEC pneumatic ensilage cutters not only cut the ensilage but elevate and distribute it with a great saving of power, time and money. They are built simply, with a few strong parts which are easily adjusted and do not get out of alignment. They are light running and durable. Full information is given regarding them and the new patented self-feeding device, which handles hay and other small growths and also corn, in their 1916 catalog, which will be sent you at once on receipt of postal card addressed to Papec Machine Co., Box 71, Shortsville, N. Y. When writing kindly mention their advertisement on page 33. —Adv.

AGAIN! ENGINE PRICES BUSTED

QUALITY MAINTAINED throughout because of perfected design and finest quality of materials bought in big quantities. I cannot afford to sacrifice quality. My engine business has grown to its gigantic proportions because quality has been maintained. I could build cheaper engines but I could not build them better. If they were not as good as I say, I could not afford to put them out on the free trial plan and easy terms! I build the quality in—you get the satisfaction out.

BUY FOR LESS MONEY NOW because increased output makes my 1916 low prices possible. If you're going to buy an engine within the next twelve months, then ask for my new big book. I have determined to build more engines and my special proposition will prove it.

SAVE $25 TO $300 by buying a Galloway 1916 Masterpiece. It is through saving my farmer friends and customers money and selling direct from my factories that I have built up this business running into the millions! I can save you money, too, on high grade engines. That's why I say

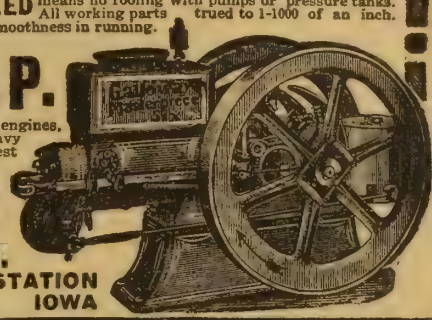
YOU SHOULD ANSWER THIS AD if you are going to buy an engine. Don't get fooled into thinking that you can get a better engine than the 1916 Masterpiece—into believing that you can buy an engine for less money that's anywhere near as good—into thinking that Galloway's claims are exaggerated and hollow! All you've got to do is ask for a free copy of

THE BIG NEW BOOK—JUST OUT which tells you why we save you money and give you a better engine—why light-weight, high-speeded engines are not to be compared with Masterpiece engines and why you are asked four profits for some engines no better. The truth of the engine business is all set down in black and white and I want you to get this book. If you expect to buy an engine I'll pay the postage and be glad to send the book.

LOOK! 1916 ENGINE IMPROVEMENTS

LARGE BORE—LONG STROKE and heavy weight means power that is horsepower. An engine that will "stand up" year in and year out—a lifetime of satisfaction! Users say so!
VALVES IN THE HEAD mean great power for gasoline consumed, economy, simplicity and modern design like the highest priced motor cars! Don't buy old style engines in 1916.
BUILT IN MAGNETO at small extra charge, means throwing batteries away. Starts easy, winter or summer. A fat, hot spark at a quarter turn of the fly-wheel! Why waste time with batteries?
HERCULES CYLINDER HEAD cannot blow off. Arching makes it strongest engine head ever designed. Water cooled head and valve stems. Big intake and exhaust valves.
MASTERPIECE IGNITER insures sparking and firing of charge in coldest weather. No spark plugs. Make and break ignition. Best, simplest, surest, safest. 75,000 users approve it.
ECONOMY CARBURETOR with special cold weather valve for easy starting. Also gets great power from small amount of gasoline. Our own invention. Exclusively used on Masterpiece engines.
NO OVERHEATING because of giant water pot and larger cooling surfaces. Water will not boil. Cylinders frost-proof.
PERFECTED OILING of all bearings. Elevated grease cups. Positive piston lubrication. Adjustable bearings.
IMPROVED FUEL FEED means no fooling with pumps or pressure tanks. All working parts trued to 1-1000 of an inch. Extra large flywheels mean smoothness in running. Big new book tells all.

1¾ to 16 H.P.



From pumping and light work engines, stationary and portable, to heavy duty moguls for the heaviest jobs. For farm, shop or factory. New big book shows every style and size we build. Engines shipped from Waterloo, Kansas City, Council Bluffs, St. Paul and Chicago.

Live Stock Items and Commercial Notes

Gathered by Representatives of The Wisconsin Farmer

Smiley's Poland China Sale.

EVERY reader of The Wisconsin Farmer, who is interested in Poland China swine should plan to spend next week at the Southern Wisconsin Poland China sales. The first sale on this circuit is that of Wm. Smiley & Son, Albany, Wis., Tuesday, February 8th. The annual sale of bred sows of William Smiley & Son need no introduction to our readers, as they have been looked forward to as one of the Poland China events of the year. The offering of this year's sale is of the same high character as the animals in previous sales, and, as the animals that have won so consistently at all of the big fairs in Wisconsin. The animals are of good size with strong, heavy bone, long, smooth bodies, wide, deep barrels and deep, thick hams. They combine both large size and good quality. The offering consists of forty-five head of spring gilts and four head of yearling and mature sows. The gilts are daughters of the splendid herd boars, which have been in service for the past year, viz.: Major Hadley, Monarch, Wisconsin Jumbo 2d, Keefer's King and Orange Price. These boars are well known to Poland China breeders in this territory, both because of their records in the show ring or the winnings which their offspring have made. The offspring of Major Hadley won first as get of sire and produce of dam at the 1915 Wisconsin State Fair. Monarch is a grandson of Major Hadley and the second prize senior yearling at the same fair. Wisconsin Jumbo 2d is a son of Peter Mouw's noted $1,500 boar, Longfellow Jr. and out of Miss Mouw, an 800-pound daughter of Big Jumbo. He is a strong, vigorous fellow with eleven-inch bone. Keefer's King is a grandson of Fesenmeyer's noted boar, A Wonder. His litter brother sold for $440 in public sale and Keefer's King is consigned his equal and by many his superior in many ways. He has a good back, wide and even, with deep, thick hams and heavy bone. Orange Price is a line bred son of Miller's Chief Price and his dam is by Miller's Big Orange, combining the blood of two excellent sires. Oakland's Giant is the son of the $1,000 boar, Oakland's Equal. These gilts are out of sows of equally good breeding and of high individual merit. They are the sows that have produced the prize-winning animals for the Smiley herd. The gilts are sows which are going into the sale have been bred for March and April litters to the above boars and to Major Miller, Big Hadley, Mouw's Wonder 3d and Big Bone Jumbo. Major Miller won first at the 1915 Wisconsin State Fair and headed the herd that won first as get of sire. Big Hadley is by Big Top, a prize-winning boar and out of a daughter of Jumbo Hadley, that was grand champion at the 1915 Wisconsin State Fair. Mouw's Wonder 3d is a grandson of the noted boar, Smooth Wonder. Big Bone is by Big Jumbo and out of Wonder Girl, a granddaughter of both Big Bone and Long Wonder 2d. These sows and gilts are, therefore, not only exceptionally well bred themselves, but are carrying litters sired by boars of well-known and proven breeding. An instructive and interesting catalog is now ready giving pictures, description and pedigrees of the animals going into the sale. Send for a catalog at once and look it over. Plan to attend the sale in person if possible, but if impossible send a mail bid to the auctioneer, Col. Ira Cottingham, or to H. S. Hoard, representative of The Wisconsin Farmer. Everyone interested in Poland Chinas should attend this sale, for there is every reason to believe that the demand for Poland China breeding stock next fall will exceed anything that we have known heretofore. Pork prices promise to be exceptionally high and the country is practically stripped of breeding stock, for this reason it will pay our readers to buy bred sows and be in a position to supply the great demand, which is sure to come. See page 45.—Adv.

Holstein Dispersion of Hetts' Herd.

A WISCONSIN Holstein dispersion of exceptional importance is that announced by George Hetts & Son, Fort Atkinson, Wis., on page 44 of this issue. The offering includes Crescent Beauty Butter Maid 129539 and more than a score of her descendants. Records of interest concerning this Holstein cow will be found in the advertisement above referred to. The offering includes the entire herd and all animals over six months old are tuberculin tested, and a sixty-day guarantee will accompany each sale. There are twenty females with seven-day butter records from twenty to twenty-nine pounds, and a dozen with yearly records from 550 to 920 pounds of butter and 22,000 pounds of milk. More than forty offspring of these worthy matrons, for the most part sired by sons of Crescent Beauty Butter Maid, the twenty-nine-pound show cow, are offered in this sale. The catalog of this sale is ready for distribution and will give complete instructions regarding the animals offered and illustrations of the character of the herd, together with the breeding and records in detail. To secure a complimentary copy of this catalog letter must be addressed to Black and White Record Co., Monona and Main Sts., Madison, Wis. —Adv.

Hasse's Holsteins.

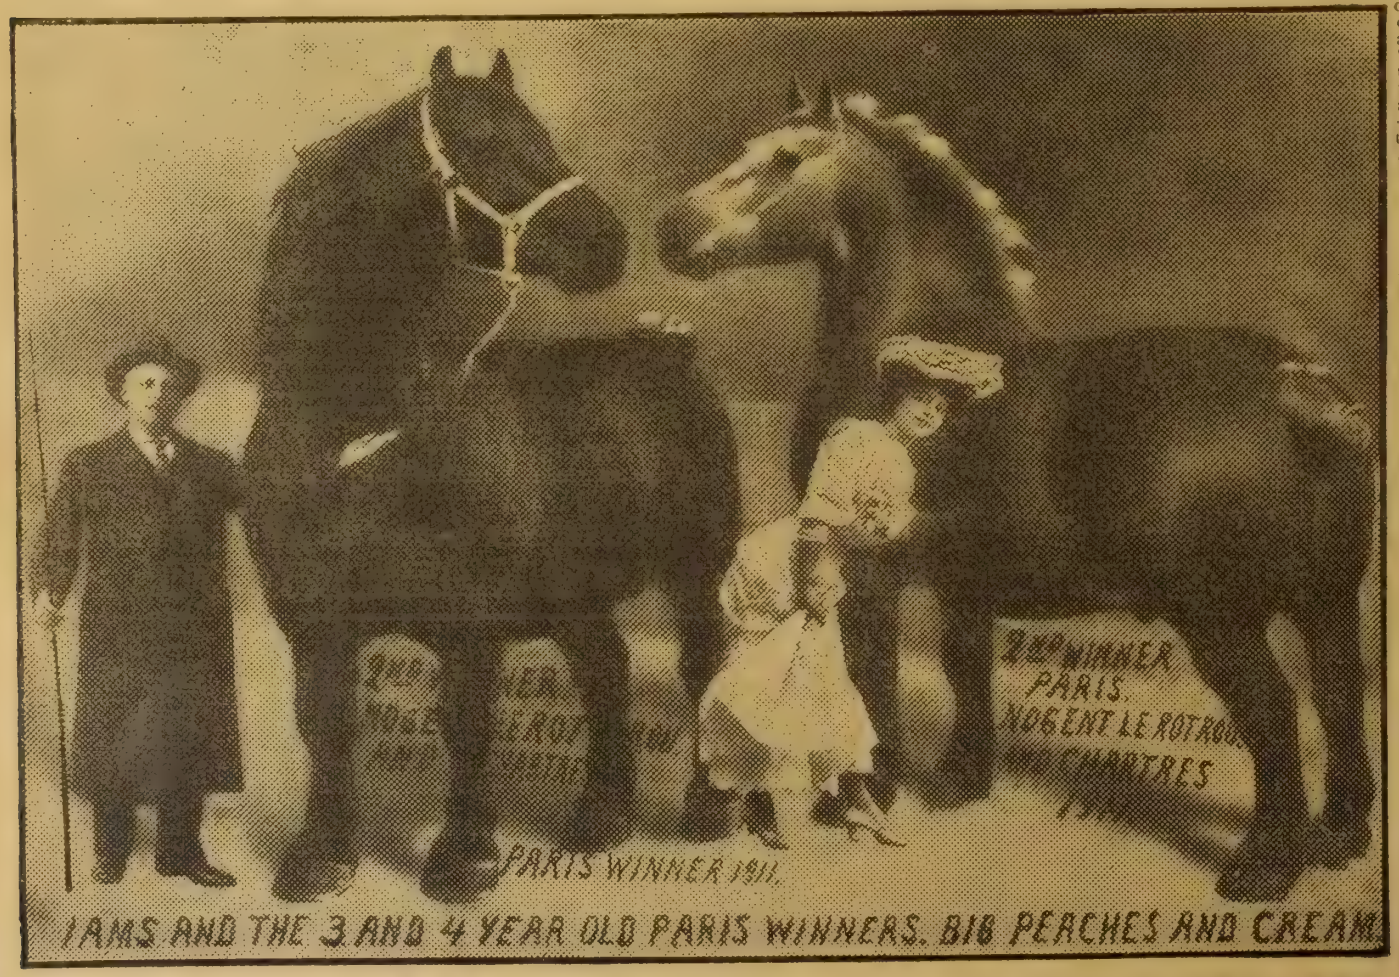
THE thirty-seven-pound Holstein bull, Sir Canary Belle De Kol, is the sire of the young bulls advertised for sale on page 47 by John Hasse, Monroe, Wis. This bull is one of the great bulls of southern Wisconsin, both as an individual and in breeding. His dam, Belle Mercedes, is a wonderful producer. She made 37.46 pounds of butter and 721.60 pounds of milk in seven days, an average of 5.5 pounds of butter and 103 pounds of milk per day. Her high record was 111 pounds of milk in a day. In thirty days she gave 146.32 pounds of butter and 2,809.20 pounds of milk. She has six A. R. O. sisters, one with a record of thirty-three pounds butter in seven days. His sire was Canary Paul 2d, a son of Canary Paul and out of a daughter of Chief Piebe Oak Duchess, that has twenty-one A. R. O. daughters, twelve with records from twenty to 31.10 pounds of butter in seven days. The cows in Mr. Hasse's herd are large, fine individuals of good, straight type and conformation. They show exceptionally good udder development and long, smooth teats. They are good producers and with ordinary herd care the two year olds give from forty to fifty pounds of milk per day and mature cows up to seventy pounds per day. Mr. Hasse recently sold five head to Gustave Pabst for his big farm at Oconomowoc, which is evidence that his cattle are of exceptionally good type. For further information in regard to the animals now offered for sale write to the above address.—Adv.

Madson's Big Poland China Sale.

CHOLERA-IMMUNE Poland China bred sows and gilts will be sold at public auction on Friday, February 11th, by M. Madson & Sons, Madison, Wis. Every breeder of Poland Chinas in this territory should plan to attend this sale, for they can take in the sale and the meeting of the Wisconsin Poland China Breeders' Association, which will be held in the evening of February 11th. The offering this year consists of thirty spring gilts and ten fall yearling and proven sows. They are exceptionally good individuals, combining large size with refined quality. The Madson herd of Poland Chinas is one of the most favorably known in this territory and have won many creditable prizes at the Wisconsin and Illinois State Fairs. The animals this year, though of larger size than their offering in former years, are of the same fine quality that has distinguished this herd. They carry long, wide backs, deep sides, thick hams and ample bone to carry their weight and keep them well up on their toes. This combination of size and quality has proven itself both by winnings in the show ring and the economical production of pork for the market. The animals are immuned to cholera a factor of much value in buying breeding stock. The spring gilts in the sale are daughters of Correct I Am, a big-type boar of large size and excellent quality. He was junior champion at the 1914 Illinois and Minnesota State Fairs. His sire was Correct I Know, grand champion at the 1915 South Dakota State Fair and his dam, Mammoth May 2d, was the dam of the prize-winning herd at the 1914 Minnesota State Fair. The fall gilts are daughters of Royal Model and Badger Perfection, the latter boar being the sire of the grand champion sow at the 1913 Wisconsin State Fair. These sows and gilts are bred for March and April litters to Triumph, an outstanding son of Hidestretcher, grand champion at the 1914 Wisconsin and Illinois State Fairs. The spring gilts are big, and growthy, many of them by date of sale will weigh close to 400 pounds. These gilts have been produced by the careful mating of big, well-developed sires and dams and by careful feeding since birth. Although they will weigh very heavy at the present time, they are not loaded with fat, but are in good, thifty breeding condition. The sale will be held in Dr. J. P. West's veterinary barn, 753 East Washington avenue, Madison, Wis., five blocks from the Chicago, Milwaukee and St. Paul station. It will not be necessary, therefore, to make a drive into the country, which is often very disagreeable in cases of bad weather. The barns are comfortably heated, lighted and ventilated and will be comfortable for all, regardless of weather conditions. Catalogs of the sale containing pedigrees and description will be sent on application. Send for one at once and look it over. If you cannot attend the sale in person send a mail bid to the auctioneer, Ira Cotting ham, or to H. S. Hoard, representative of The Wisconsin Farmer. See advertisement on page 45.—Adv.

Frank Iams' Offering.

FRANK IAMS, St. Paul, Neb., is not one to "lay down" because draft horses cannot be imported. He has suceeded in rounding up forty stallions and mares, including home-bred and imported animals, and he is offering these at bargain prices. He says: "Big Ikey" Horseman:—"Success knocks" at your door today. Be a "wise guy"—get into the "get rich quick wagon." Buy and breed all the full blood and grade Percheron and Belgian stallions and mares possible. The investment will make you 100 per cent. (Borrow the money if you have it not.) Big, imported and home-bred stallions and mares are scarce, getting higher and scarcer "daily." We are "8,000 stallions short" in 1916. No Percherons or Belgians will be imported in ten years. Europe must buy a "million horses" more of United States. "Ikey Farmer" "get busy" buy a stallion and pair of mares, today, and breed colts that sell at $500 at six months old—or $1,000 at two years old, then you wear "the diamonds." United States has a "big horse famine" "farmers and war" must have horses. Frank Iams is at "the bat" with forty new horses, his "show herd," Paris and Iowa and Nebraska State prize winners. They will "positively" be sold at "some price." "Ikey buyer" see Iams and his big "black boys," "real top notchers" and at "bargain prices." To make a "clean up" Iams is "cutting the melon" and giving "his customers" the "big half." Iams has the great "Paris winner," "Iliade" (82644) weight 2340 pounds, black, winner of second prize at Paris, Nogent Le Routrou and Chartres, the three largest horse shows of France. He is positively the best Percheron in the United States. He has other "gold medal" winners almost as good. The "champion" double "gold medal" winning Percheron two-year stallion, weight 2,100 pounds—"Dentist" (over all ages) at the Nebraska State Fair, 1914—also the best pair of "ton" three-year-old prize-winning mares at Iowa and Nebraska State Fairs. Also his 1915 "show herd" that are "the talk of all buyers." "Iams bell ringers." You will sure buy of Iams if you are looking for a "topper" and "know one" when you see him. "Mamma," Iams is a "hot advertiser," but he has "the horses as advertised." "It's up to you," Mr. Stallion Buyer, buy a "through ticket" to "Iams' horse town." Walk right in and say "hello," Iams will meet you with a $1,000 smile and treat you like "a prince" and there are "some doin's there daily. Iams' Paris "prize winners" make all buyers "sit up and take notice" at his "bargain counter" prices. Iams and the "pink lady saleslady" will not let any buyer with money or good notes get away. "Ikey" "come on along," buy imported horses today. Don't wait. They are "big snaps," that is why Iams and the "pink lady saleslady" are reducing prices on "show and business stallions." He made a "killing" buying those "top notchers" and to close out and make a clean up he has determined to sell and give buyers big snaps. "Ikey" "Horseman" Iams' six financial letters of recommendation from six of the best banks in Nebraska (shown in his catalog) tell you why you should buy Imported stallions of Iams. His thirty-four years of successful business, his "one-half million dollars behind his guarantee"—the fact that he is a "live wire" business man and expert horseman—in a "class by himself." He makes all competitors "stutter" and "get their hammers" out for Iams. When stallion buyers visit "Iams' horse emporium" they find "Iams" has the horses as represented and that Iams "makes good," and his "old customers" are his best page advertisers." "Ikey" "get busy," quick. Buy "show horses" of Iams and "wear diamonds." Iams is sure taking the "curl" out



TYPES found in the stables of Frank Iams, St. Paul, Neb., who has forty imported and home-bred stallions and mares weighing from 1,850 to 2,400 pounds. Iams claims he has 75 per cent of the "cream" stallions raised by American breeders.

of "high prices" on the best bunch of real "top notchers" ever offered for sale in the United States. Iams has more "show horses" and big "van horses" on hand than any importer in the United States and at same price and "some less" than for ordinary stallions. See advertisement on page 44.—Adv.

J. C. Hendricks' Big-Type Poland Sale.

THIS is the last call to the big-type Poland China sale of J. C. Hendricks, which will be held Wednesday, February 9th at Hazel Green, Wis. If you havn't sent for a catalog of the offering write or wire for one at once. However, if you don't get a catalog go to the sale anyway, for the offering is worthy of going a long ways to see. The breeding is of the best obtainable, being of blood lines that have proven right in the show ring and profitable in the pork barrel. As individuals they are outstanding, combining large size with good width and depth. They have been grown steadily from birth, so that they are of large size and very heavy for their age, although not crowded with fat. Many of the spring gilts weigh close to 425 pounds and the older sows from 600 to 700 pounds. The gilts carry seven to eight inch bone, but are not coarse and rough in any way. The aged sows are daughters of such noted boars as Fesenmeyer's A Wonder; Peter Mouw's Big Bone, the 1,000-pound boar, Big Bug; Wisconsin Giant, a heavy prize winner and Big Leader by Giant Leader. The gilts were sired by Smooth Wonder, Repeater, Black Jumbo, High Wonder and H.'s Jumbo. Repeater is an exceptionally fine boar, weighing 850 pounds at two years of age. He is a son of Big Bone and out of Orange Lady by Longfellow 7th, all of which are bred by Peter Mouw. High Wonder is a son of Caverly's 600-pound boar, Long Wonder 2d, Black Wonder is a 1,000-pound boar by Heavy Bone. Smooth Wonder is by Wonderful by A Wonder. On December 30th Mr. Hendricks weighed every animal going into the sale and the catalog shows the weight of each animal on that date. They will weigh considerably more by sale date, as they will gain very markedly in six weeks. As an indicator of the weight at that time a few of the litters are mentioned as follows: Five gilts from the litter of Big Daisy and sired by Smooth Wonder averaged 340 pounds; four from the litter of Merry Miller sired by Repeater average 320 pounds; five from the litter of Wisconsin Giantess sired by High Wonder averaged 330 pounds. The sale will be held on the farm in a well heated and lighted sale pavilion which will be perfectly comfortable regardless of weather conditions. Plan to attend the sale in person if possible for it will pay you to see these animals. However, if impossible to attend the sale send a description of the kind of animal you want and a mail bid to the auctioneer, Ira Cottingham, or H. S. Hoard, representative of The Wisconsin Farmer. Mr. Hendricks states that all animals sold on mail bids may be returned if not satisfactory. See page 45.—Adv.

Martin's Red Polled Cattle.

THE Martin herd of Red Polled cattle is well known to every breeder of Red Polled cattle through the high records made by the animals in this herd. This herd was established over thirty years ago by J. W. Martin, Gotham, Wis., and is still conducted by him and his son, H. A. Martin, secretary of the American Red Polled Association. Mr. J. W. Martin has been one of the leading importers into the United States, for twelve years going to Europe at least once a year. He was personally acquainted with such breeders as Squire Taylor-Coleman, noted manufacturer, and others whose herds won the championship of England honors. In 1890 Mr. Martin was elected by the Red Polled Association to go to Europe and select representative animals of the best type to exhibit at the Chicago World's Fair. He introduced the Babcock milk test into England and his purchases of animals were based on the amount of butter they produced. Such noted bulls as Corporal and such cows as Pear have made the Martin herd recognized as among the leaders of the breed. The majority of the high Advance Registry records made by Red Polled cows were made by animals or offspring of animals that came from this herd. The world's champion Red Polled record was recently made by Jean Du Luth Beauty 31725. She broke every world's record for the breed from seven days to 365 days. In a year she made 891.58 pounds of fat, which, figured at 80 per cent butter, equals 1,114.3 pounds of butter. She is a daughter of Proctor Knott, America's leading Red Polled sire of A. R. daughters. Mr. Martin has some choice young bulls for sale of serviceable age and younger of choice breeding and good type. For information in regard to these animals see advertisement on page 46.—Adv.

Dependable Seed Corn for Wisconsin Growers.

WHEN you buy seed corn the thing that you want most is dependability—seed that you know will germinate and grow. For half a century the Gurney Seed & Nursery Co., Yankton, S. D., has been furnishing seeds and nursery stock of all kinds that has won a name for its dependability. This year they have a splendid assortment of seed corn for Wisconsin growers. They have already received orders for thousands of bushels from Wisconsin farmers and the shipments already made have proven highly satisfactory. They have more of the same kind for you and can supply you from either the 1914 or 1915 crop. Their 160-page catalog, describing their various kinds of seeds and nursery stock, is now ready and will be mailed to you free if you will write to Gurney Seed Co., Box 112, Yankton, S. D., and mention their advertisement on page 25.—Adv.

E. W. Hendricks' Poland China Sale.

TWENTY-SEVEN spring gilts, nine fall yearling gilts and three proven sows, comprise the offer in the sale of E. W. Hendricks, Hazel Green, Wis., to be held Thursday, February 10, 1916. These are of strictly big-type breeding of the best strains obtainable. Not only are the animals well bred, but as individuals they can scarcely be faulted. They are of large size with big, heavy bone, yet are not the big, rangy kind that are lacking in quality. On the contrary these animals are well developed, being both wide and deep with thick, heavy hams aid smooth sides. Five of the fall gilts are daughters of the noted boar, Oakland's Equal, for which J. B. Erwin paid $1,000. Five fall gilts and four tried sows are by Big Jumbo, one of the largest and best boars in the corn belt. He is a mammoth fellow, weighing 1,100 pounds in show condition and is only three years of age, although exceptionally large with heavy, eleven-inch bone he is almost as smooth as a pig. He has a strong, arched back, is well up on feet and is very wide and deep. He was sired by Heavy Bone by Big Bug by Big Bone. Two of the sows are out of daughters of Fesenmeyer's boar, A Wonder. The spring gilts are daughters of Peerless Wonder, Black Jumbo and Great Leader. Peerless Wonder is a son of Fesenmeyer's noted boar, A Wonder, whose reputation as a breeding sire is known to all Poland China breeders. Great Leader is by Tecumseh Leader, the noted boar of E. A. Frazer, that weighed 1,055 pounds at twenty-nine months of age. His dam, Miss Nelson Prospect 2d, is a daughter of John B. Lawson's noted sire, Jumbo Big Prospect. It will be seen that the sows and gilts going into this sale are of well known and proven blood lines, representing the best in the breed. They are bred for spring litters to Big Oakland, Long Joe, and R.'s Wonder. Big Oakland is a son of the

BEAUTY PIETERTJE ORMSBY PAS-MA 157994, A. R. O. record 27.14 pounds butter in seven days at four years old. Owned by C. B. Reddelein, North Lake, Wis.

$1,000 boar, Oakland's Equal, and out of A Wonder dam. Long Joe is a son of Big Special and out of a daughter of Fesenmeyer's noted boar, Big Joe. R.'s Wonder is by Rood's A Wonder and out of a daughter of the $1,500 boar, Longfellow Jr. The litters which these gilts are carrying make them of added value. Mr. Hendricks is a careful, discriminating judge of Poland Chinas and his herd is considered by many prominent breeders to be one of the best in Wisconsin. Many of the spring gilts going into this sale will weigh better than 400 pounds and the matured sows will weigh from 600 to 700 pounds. Catalogs have been issued giving description and breeding of the animals going into this sale. Send for catalog at once and look it over carefully. Plan to attend this sale in person if possible, but if impossible send a mail bid to the auctioneer, Ira Cottingham or H. S. Hoard. See advertisement on page 45.—Adv.

Tochtermann's Holsteins.

WHEN in Green county recently the writer had the privilege of visiting the Holstein herd of Chris Tochtermann, Jr., Monroe, Wis. The herd consists of some forty head of registered animals of exceptional merit. Some twenty years ago Mr. Tochtermann purchased the choice heifer calf from one of the best herds of Holsteins in southern Wisconsin. His present herd all traces to this original foundation cow, with but two exceptions. He has purchased bulls form high-producing and long distance milking cows of good straight type following the Johanna line of breeding. By thus carefully selecting his breeding stock he has produced a herd of large, well-developed animals of good type and heavy

If you want good Holsteins attend

New York State Breeders' Sale

February 9th and 10th, at the

Sale Pavilion Syracuse, New York

NO BETTER cattle were ever offered in public sale than the grandly bred bull, KORNDYKE PONTIAC PET and FIVE of his daughters. You know he is by Pontiac Korndyke from the 37.68-pound cow, Pontiac Pet. A daughter of Tidy Abbekerk Prince (eight 30-pound daughters now), bred to King Pontiac Mayflower, the bull with a future. A son of King Korndyke Sadie Vale from a 25.8-pound four year old. A son of King of the Pontiacs ready for service. Daughters of Spring Farm King Pontiac 6th and eligible to the $1,000 futurity prize. A daughter of King Korndyke Sadie Vale from a 25-pound two-year-old daughter of Sir Korndyke Pontiac Artis, her dam a 25-pound two-year-old daughter of Sir Veeman Hengerveld.

Holstein Sales Company Elgin, Illinois

production ability. He has made a large number of creditable A. R. O. records both for seven days and the year, winning $125 prize money from the association two years ago. He believes very strongly in yearly records and contemplates getting the yearly record of every animal in the herd. At the present time he is offering a number of yearling bulls ready for service. These are from untested and A. R. O. cows of heavy production ability. They were sired by Piebe Longfield De Kol, a grandson of Homestead Jr. De Kol, that has sixty-nine A. R. O. daughters, five with records from thirty to 35.55 pounds of butter in seven days. For pedigrees, description, etc., of these animals write to the above address. When writing kindly mention The Wisconsin Farmer. See page 47.—Adv.

Kirkpatrick Brothers' Holsteins.

ATTENTION is called to the change in the advertisement of Kirkpatrick Brothers, Reedsburg, Wis. They are advertising a fine young bull of serviceable age, whose dam and sire's dam average 26.50 pounds of butter in seven days. His dam as a four year old made 24.94 pounds of butter and will be tested again. His sire's dam, Griselda Inka, made twenty-eight pounds. They are also offering a few yearling bulls from untested and A. R. O. cows, sired by King Pontiac Korndyke Champion, a grandson of King of the Pontiacs. His dam, Fancy De Kol Ormsby, made 22.08 pounds of butter in seven days and 560 pounds of butter in a year. She is a daughter of Sir Ormsby De Kol, that has six A. R. O. daughters with records up to 27.83 pounds of butter. His sire, King Pontiac Champion, has eighteen A. R. O. daughters and is out of a thirty-one-pound daughter of De Kol 2d Mutual Paul. The bulls offered for sale are well marked, of good, straight type and well grown. Eight cows are also being offered for sale at reasonable prices. For extended pedigree and further information in regard to these animals write to the above address. See advertisement on page 47.—Adv.

What Is Corona Wool Fat?

CORONA WOOL FAT is a wonderfully healing and scientific preparation, extracted from the skin and wool of healthy sheep, that will cure all flesh wounds and hoof sores on horses. It is cooling, penetrating and quick in action, but does not burn, blister or cause pain. It is said to grow a new hoof and to heal all flesh wounds without leaving a scar. On page 48 is an advertisement giving proof of these facts from men who have used it, together with a liberal trial offer that enables you to order a can for twenty days' use without payment of a cent. If it does what is claimed in the advertisement you then send 50 cents for it, but if not you do not owe a penny. A million farmers, stockmen and blacksmiths are said to be using Corona Wool Fat with highly satisfactory results. After reading the convincing advertisement you can secure a trial can by merely filling out the attched coupon and mailing it to C. G. Phillips, Manager, Corona Mfg. Co., 44 Corona Block, Kenton, Ohio, and mentioning this paper.—Adv.

The Story of 25 Championships.

IF you want to know the story of how Belle City incubators won twenty-five championships, as told by the people who operated them and fully illustrated, you can get it free by writing to the makers for their big book, "Hatching Facts," illustrated in colors. With the book comes their $1,300 gold offers for the season now beginning. All this is described in their advertisement on page 19. There are over 400,000 Belle City incubators and brooders in use and they have a long record of prize winning and daily satisfaction behind them. They are shipped quickly from Kansas City, Minneapolis or Racine. In writing for their booklet and other valuable information address Belle City Incubator Co., Box F 106, Racine, Wis., and please mention their advertisement in this paper.—Adv.

Four Requirements of Clover Seed.

WHEN buying clover seed you should look for four main points—first, that it is pure and free from the seeds of weeds; second, that it has high germination; third, that it is plump and of good color; fourth, that it is hardy and adapted to severe weather conditions. All of these elements are combined in Northrup, King

HOLSTEIN herd sire of Kirkpatrick Bros., Reedsburg, Wis. See advertisement on page 47.

Co.'s seeds, which are handled by 15,000 dealers. Their thirty-second annual catalog describes fully their "Sterling," "Northland" and "Viking" brands which bear their reliable guarantee for seed excellence. This catalog will be sent free to anyone replying to their advertisement on page 25 and addressing Northrup, King & Co., Hennepin and First Sts., Minneapolis, Minn.—Adv.

Parker's Durocs.

A FINE lot of Duroc spring gilts are advertised for sale on page 46 by E. H. Parker, Janesville, Wis. These gilts are choicely bred, being sired by Defender Golden Model and Wonder Boy. The first boar is a son of Lee's Defender, grand champion at the 1914 Wisconsin State Fair. Wonder Boy is a son of Marion's Wonder, grand champion at the 1914 Wisconsin State Fair. These gilts are cholera immune, are of large size with long, smooth, deep sides and deep, thick hams. They will prove a profitable investment.—Adv.

Derivan's Poland Chinas.

POLAND Chinas of the type that will do you the most good are advertised for sale on page 46 by James Derivan, Fox Lake, Wis. They are large and growthy, and yet not coarse and the hard feeding kind. They combine the

CRESCENT BEAUTY BUTTER MAID 129569

AT THREE YEARS---

Butter, 7 Days - - -	29.04
Milk - - - - -	531.80

AT TWENTY-EIGHT MONTHS---

Butter, 359 Days - - -	671.61
Milk - - - - - -	14965.30

First prize four year old and grand champion at National Dairy Show (1913). First prize at Indiana and Illinois state fairs and Waterloo Dairy Cattle Congress. First prize National Dairy Show (1914), New York and Illinois state fairs and Waterloo Dairy Cattle Congress. The sale also includes more than a score of her descendants.

90 HEAD INCLUDING two score well-bred females in the milking herd. Twenty with 7-day butter records from 20 to 29 pounds; a dozen with year records from 550 to 920 pounds butter and 22,000 pounds milk. More than 40 offspring of these worthy matrons, for the most part sired by sons of Crescent Beauty Butter Maid (the 29-pound show cow). The offering includes the entire herd and with a single exception all are unblemished. Herd sires used include: Greenwood Johanna Lyons—a grandson of the well-known 34-pound cow, Betta Lyons Netherland. Crescent Beauty Butter Boy—a son of the above sire and Crescent Beauty Butter Maid (the great show cow). Crescent Beauty Segis Pontiac—by the noted sire King Segis Pontiac, also from Crescent Beauty Butter Maid. Most of the females are bred to this young bull who will be sold with the rest. All animals over 6 months of age are tuberculin tested and a 60-day guaranty will be given with each. The catalog gives apt illustrations of the character of the herd and the breeding and records in detail. It may be had only by addressing the sale managers: Black and White Record Co., Monona & Main Sts., Madison, Wisconsin. Auctioneers, Cols. R. E. Haeger, J. E. Mack, E. M. Hastings in the box.

Geo. Hetts & Son **Ft. Atkinson, Wis.**

big and medium types in a splendid manner, maintaining the superiority of both and the faults of neither. For pedigrees and further description of the animals now offered for sale, write to the above address.—Adv.

A Wisconsin Tractor For Wisconsin Farms.

THE Eagle tractor is a combination tractor and portable engine and will do all the work on a farm that either of these machines is supposed to do. It is admirably fitted to Wisconsin farming conditions and satisfactorily solves the tractor problem of the small or moderate sized farm. It has two cylinders with superior engine qualities and refinements and withal it is built compactly, making it especially adaptable to small farm work. Every Eagle tractor has four wheels and two drivers, while its valve-in-head action gives extra power and clean combustion for both tractor and belt work. A high tension magneto with impulse starter does away with batteries. For complete description and prices write to Eagle Mfg. Co., 622 Winnebago St., Appleton, Wis., and kindly mention their advertisement on page 10.—Adv.

New York's Big Holstein Sale.

THE big event of the winter months in Holstein circles will be the two days' sale at Syracuse by New York state breeders. It will be an offering of top Holsteins throughout, and the catalog tells a story that will interest every lover of good, high producing Holsteins. In the advertisement on page 43 will be found a list of some of the good things to be offered in this big sale, and it will be noted they represent the strongest producing strains of the breed. The Holstein Sales Co., Elgin, Ill., is managing this sale and will furnish any desired information. When you write kindly mention The Wisconsin Farmer.—Adv.

Northern Grown Nursery Stock.

THE Farmer Seed & Nursery Co., Faribault, Minn., is announcing the publication of their new seed and nursery book, containing full information regarding their northern grown trees, plants and shrubs, which are best suited to northern farms. This book will be sent free on application to Farmer Seed & Nursery Co., 104 First Ave., Faribault, Minn. In writing for it please mention their advertisement on page 26.—Adv.

HENRY LEFEBURE, Fairfax, Iowa, whose advertisement appears on this page writes: "With the buying season now on the prospective buyers of Belgian horses will find that we are just as well supplied with Belgian stallions and mares as ever before. We have not only the largest collection of Belgian horses in America, but we can say without fear of contradiction that we have a larger collection of imported Belgian stallions, all weighing a ton and up to 2,350, than can be found in any other barns in America. We are unusually well prepared to show you choice two and three-year-old American Belgians weighing from 1,700 to 2,300 pounds, sound, weighty and ready for service. We have on hand fifty imported Belgian mares and we are now offering two and three-year-old fillies for sale. We can show you teams in any color. The demand from the Dakotas for the big ton stallions is so great that the Iowa and neighboring states horsemen will have to hurry. Five of our December sales were in North Dakota. Our barns are full of good "buys." Come and spend a day with us."—Adv.

HOLSTEIN-FRIESIAN CATTLE.

Upland Farms, Walworth, Wis.

E. E. Ayer, Prop. **J. H. Travis, Manager**

OFFERS a number of very choice yearling Holstein bulls ready for service. They are well marked—of good straight conformation and well grown. These young bulls are choicely bred, being sons of the 27-lb. bull, **Sir Pontiac Artis Duke 77994,** a son of the 31.71-lb. bull Sir KorndykePontiac Artis that has 45 A. R. O. daughters. His two nearest dams average 29.42. His three nearest sires have 158 A. R. O. daughters, eleven with records over thirty lbs. Send for pictures, pedigrees and descriptions.

Purebred Registered
HOLSTEIN CATTLE

Advanced Registry cows sell for more. The Advanced Registry Office maintained by the Holstein-Friesian Association is of great advantage to owners of purebred Black-and-White cattle. The official records of its absolutely impartial and authentic tests of your cow establish a positive and relatively high value on the animal. Her official record is proof positive to the buyer of her true value as a producer. Carefully compiled records show that the average auction price of Holstein cattle in 1908 was $150. In 1914 the average auction price was $255. Investigate the big "Black-and-Whites."
Send for FREE *Illustrated Descriptive Booklet.*
The Holstein-Friesian Association of America
F. Houghton, Sec'y, Box 143, Brattleboro, Vt.

I'll Send You This Big Can of CORONA WOOL FAT Post Paid

SIMPLY mail me the coupon below and I'll send you this big can of *Corona Wool Fat*—the greatest preparation ever put on the market for Cracked and Split Hoofs, Contracted Feet, Corns, Grease Heel, Thrush, Barb Wire Cuts, Sore Shoulders, Sore Teats on Cows, etc. I want to prove to you ***before you pay me a single cent,*** that here is a preparation you can't afford to be without. I want to send you, postpaid, this big can on

Cracked Hoofs Before and After Using Corona Wool Fat

20 Days' Free Trial

I want to show you that you can keep your horse's hoofs in the finest condition—take out all foot soreness, cure all flesh wounds, etc. and do it quickly.

I want you to try this wonderful healing ointment at my risk—not yours. Try it on any case you have—apply part or all of it. At the end of 20 days if you are perfectly satisfied, send me only 50c for the big trial can. If you are not satisfied, tell me so and you won't owe me a penny.

CORONA WOOL FAT

The Wonderful Healing Ointment

is extracted from the skin and wool of the sheep and is the only remedy that will penetrate the shell of a horse's hoof—take out the soreness and grow new hoof. ***Corona Wool Fat*** does not burn, blister or cause suffering. It is a cooling, healing, penetrating ointment, quick in action, ***heals without leaving a scar.*** Read these letters—we have thousands more like them:

Corona Mfg. Co., Kenton, Ohio.

Gentlemen:—Corona Wool Fat is the best thing I have ever used for hard and contracted feet of horses. I have used about all kinds.

Yours truly,
P. D. Jamison,
Bridgewater, Maine.

Corona Mfg. Co., Kenton, Ohio.

Gentlemen:—I like Corona Wool Fat. I think it is fine to heal sores and cuts, and can truly recommend it to any one needing a good healing salve.

Yours truly,
Dewitt Conrad,
23 State St., Fort Plain, N. Y.

Send No Money—Simply Mail Coupon

If you have never sent for a trial can of Corona Wool Fat, fill out the coupon and mail it today. When you receive the ***Corona Wool Fat***—try it—watch results—then if satisfied, send me only 50c—if not satisfied, just write and tell me so and I'll charge you nothing. Write for the big trial can ***now.*** Remember, I send it ***postpaid.*** You risk nothing in testing it. ***Will keep your horses in working condition and put them in selling condition.*** I take all the risk—send today.

Corona Mfg. Co., C. G. Phillips, Manager **44 Corona Blk., Kenton, O.**

IT WILL CURE

Hard and Contracted Feet, Mud Fever, Split Hoofs, Corns, Grease Heel, Thrush, Quarter Crack, Cuts, Barb Wire Wounds, Sore Teats of Cows, Ulcer, etc.

Our Guarantee is on the Lid of Every Can.

I have sent out a million cans the past eight months, and now have more than that number of satisfied customers. You need it; I have it for you, and you can try it out on the "before you pay" plan. Now, all I ask is a fair, square trial on its merits. *C. G. Phillips.*

Proof!

Corona Mfg. Co., Kenton, Ohio.

Dear Sirs:—I received the Corona Wool Fat all right and have tried it and it works just as you recommend and even better. My horse was sore in the front feet and she could hardly get out of the barn, and in two weeks time she improved so much that she was as limber as ever, and our blacksmith stated that he never saw anything as good as Corona Wool Fat.

Sincerely, T. J. Tishell,
North Rush, N. Y.

Corona Mfg. Co., Kenton, Ohio.

Dear Sirs:—Having been in the dairy business all my life and as all dairymen will agree it is a hard matter to keep their horses going sound. I with the help of the shoeing smith were kept at our wits end until a friend of mine told me of Corona. It certainly does the work. Every horse is going sound and when it comes to sore teats on cows you have certainly solved the problem. In fact, my stable and barn boys all swear by Corona and the best part of it is, it is just as good for a man as for a horse or cow. Wishing you the success that is due you, I remain, Yours very truly,

Robt. T. Armil, Prop.
Oakwood Dairy Farms, Davenport, Ia.

Corona Mfg. Co., Kenton, Ohio.

Dear Sirs:—I am very well pleased with Corona Wool Fat, and am enclosing you remittance for more of this wonderful product. It is great stuff. Yours truly,

Louis J. Dumont,
R. F. D. 1, Wolverine, Mich.

Corona Mfg. Co., Kenton, Ohio.

Gentlemen:—Corona Wool Fat is just the stuff for my bank mules feet as it keeps the bank water from cracking their feet and getting sore. Enclosed find remittance for $3 for which send me a ten pound pail. Yours truly,

W. F. Williams,
New Sharon, Iowa.

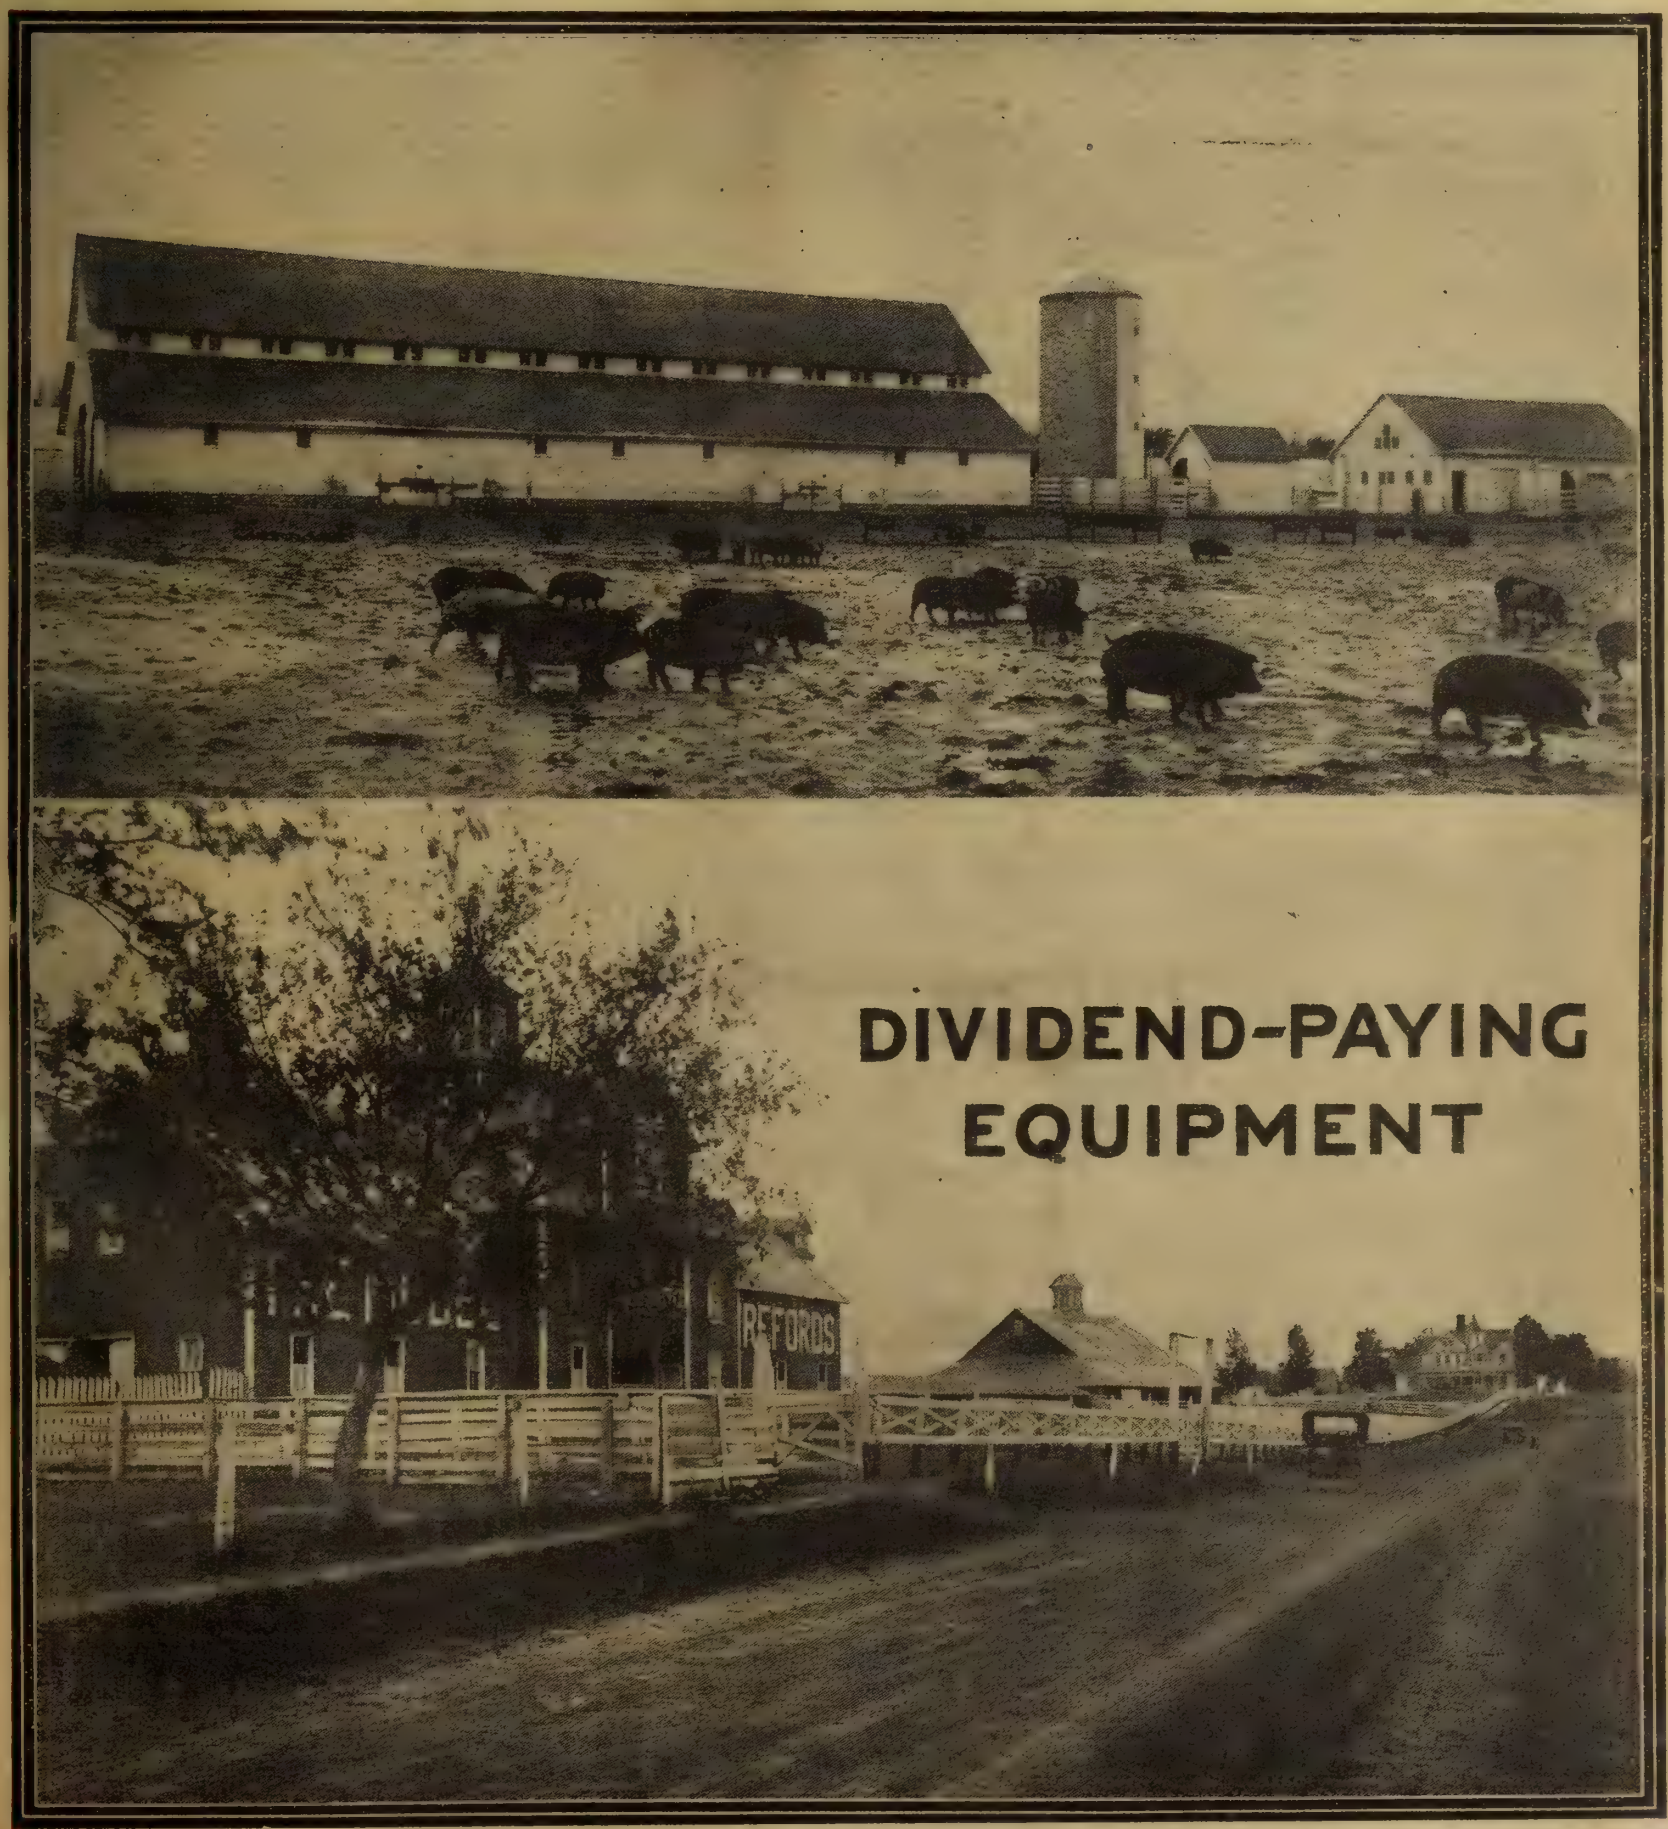
THE WISCONSIN FARMER

VOL. XLV. NO. 6. THURSDAY, FEBRUARY 10, 1916. WHOLE NO. 1776



PAIGE

The Standard of Value and Quality

For Your Own Protection a Paige

We want you and your family to FIND FOR YOURSELVES in this new Paige Fleetwood "Six-38" ($1050) your ideal of what a five-passenger motor car should be.

We want you to find for yourself the tremendous POWER, sturdiness and reliability of the motor. You will need this on steep hills, in sand, for all those road-conditions that bring out the real worth of a motor. We want you to find for yourself the flexibility of the motor (from 2½ to 60 miles an hour) and the remarkable ease of control.

We want you to see for yourself the beauty of line and design, the elegance and the luxury of the equipment and furnishing throughout.

We want you to find for yourself the REAL VALUE and QUALITY and SUPREMACY of Paige cars.

We want to make this vital point. A cheaper purchase price isn't necessarily a saving. Often it proves later to be a liability—a heavy and needless expense. Thousands of motor car owners—some say as high as 33⅓ per cent of all owners—have disposed of the cheaper cars with which they began, for cars of real value, quality and character.

Why? Because they have found that the cheaper cars haven't given them the comfort, the service, the saving in upkeep and, at the end of the year, the value as an investment.

Ask Paige owners why they bought Paiges and continue year after year to buy Paiges. They will tell you YOUR final choice will be a Paige; that it is expensive to experiment with anything below Paige Quality; that it will save you time, money and annoyance to buy a Paige FIRST and buy it NOW.

In their efforts to keep pace with Paige Cars—the Fleetwood and the seven-passenger "Six-46"—other manufacturers of Light Sixes are introducing radical features—new designs—new power plants—new engineering theories. These are all experiments.

Why should YOU risk an experiment?

Why should YOU consider anything but the national standards of six-cylinder value—the five-passenger Fleetwood "Six-38" at $1050 and the seven-passenger Fairfield "Six-46" at $1295?

Paige cars have won the overwhelming endorsement of the American people. They have been perfected to the current hour of motor car building. They are built and backed by one of the strongest companies in the industry.

Why buy anything but a proved, an established success? Why anything but a Paige?

FAMILY CIRCLE TALKS
BY THE PUBLISHER

IMPROVING OUR FARM HOMES

A GOOD point was raised by a Nebraska farmer, speaking at the Iowa Short Course, last week. He declared that while farmers are evidencing their prosperity and progressiveness by spending $2,500 every fifteen minutes, in Iowa alone, for new farm buildings, they are not always exercising good judgment in the selection of the site and the materials and the efficiency of arrangement. I believe we can well afford to consider this matter for a few minutes.

It is gratifying to our pride to know that no section of the country is making greater headway than ours in this all-important matter of beautifying our farm homes, adding the necessary comforts and conveniences, and erecting barns, silos, cribs and outbuildings which shall reflect the fertility and prosperity of our farms. Thus, in the ten years ending with 1910, when the last federal census was taken, I find that here in the grain belt the value of farm buildings had increased 100 per cent (being exactly double what it had been ten years before) while in New England the increase, in the same time, had been but 37 per cent, in the middle Atlantic states but 34 per cent and in the United States as a whole but 77 per cent. In other words, the farmers of Wisconsin, Iowa, Missouri and Kansas are spending three times as much for their farm buildings as are the farmers of Massachusetts, New York and Pennsylvania. While this is gratifying and while it is somewhat appalling, because of the magnitude of the figures, to learn that the value of the farm buildings in the grain belt today is almost $4,000,000,000, still this is a matter in which the largeness of the figures is not the only thing to be considered. Even more important is this: Are we spending our money wisely? Are we getting the best possible returns from this large expenditure?

No one is a firmer advocate of improving the farm home than I am. I do not believe the profits of our fields and herds could be used to better advantage than to modernize the old farmhouse (installing a water-under-pressure system so as to save the good wife steps and backaches, artificial lighting systems, sewage-disposal systems and so on) or to replace the old farmhouse with a new and up-to-date structure or to build large barns and outbuildings which shall be a credit to our farm and our standing in the community. But shall we not be systematic about it? What good is a fine new farm home, with water faucets ready to the hand, just as convenient as any city home has them, if our water supply is contaminated by near-by filth; if our house is built too close to the barnyard, with its filth; if our drainage is not properly looked after; if we do not consider waste steps and inefficient running back and forth, covering the same ground over and over in a futile, chicken-with-its-head-cut-off manner? It is not necessary that we go to a city architect and spend several hundred dollars for house-building plans and farmstead arrangements, but when we are spending so much money for farm buildings and farm beautification shall we not use our common sense and take advantage of the service which the agricultural college offers in practically every state and practically without charge? By this service we can arrange our farmsteads so as to conserve time, steps and money and equip our houses with those comforts and conveniences which will keep the good wife from getting old before her time. By all means, let us give to our farm homes everything that will make life easier and work more effective, but let us see to it that this work of remodeling and rearranging is done just as systematically and as scientifically as we go about breeding stock and growing grain. There is nothing about farming or farm life, my friends, that can be done in a slipshod, haphazard fashion, without the effects being visible and costly, in money, in health and in happiness.

I am delighted to see such widespread interest in this subject of farm-building improvement. Nothing appeals to me as more interesting or important. As I drive around the country I have seen scores of places where the old farm home of the early, pioneer days has been supplanted by a new, up-to-date home, set right in front or to one side of the old place, eloquent testimony to our prosperity and progressiveness. I have in mind one place where there are three houses: The very first, pioneer one; then one of the middle eighties; lastly the new, modern structure erected just last year. A picture of these three places would tell the whole story of grain-belt prosperity. I shall print it for you some day and perhaps tell how the owner reached the various stages reflected by the homes which he occupied. It will be a story well worth reading, I feel sure.

WHY NOT A FOOD PREPAREDNESS?

WE HEAR much nowadays about war preparedness; would it not be a good thing to hear a little more about peace preparedness? Instead of devoting our time and attention to those things which take human life, why not consider as well those things which nourish and sustain human life? In brief, why not have an agricultural preparedness, as well as a military one?

I was quite interested the other day in what one of our best corn growers of the grain belt told me. He said when a young boy, forty-three years ago, he worked on a farm and he will never forget how one day the farmer for whom he worked called to him and said: "Get into that crib and pick out the seed corn; tomorrow we start planting." No germination boxes, not even a rag-doll tester; it was trust to luck that a young boy would pick out the ears which would produce the most and best corn; if not, there would be another crop failure; nobody could tell until harvest time. "I often wonder," added the man who told me this, "if we have completely gotten rid of that kind of farmers. I hope so, but I'm not sure." I could only add that I did not believe any of my readers would be guilty of such a thing.

But can we sit down complacently and confidently assert there is no such farming going on round about us today? An Indiana friend writes me to say that in their five-acre corn contests, in 1914, there were twenty-one farmers who raised more than 100 bushels of corn to the acre. The average for the United States as a whole is but twenty-five bushels. What kind of farming is going on that this 100 bushels should be cut down seventy-five bushels in the national average? Farming in which there is not enough preparedness for the uncertainties of soil, climate and general conditions; that and nothing else, in my opinion.

One of the speakers at an agricultural gathering which I attended recently pointed to the fact that whereas just ten years ago we had exported 120,000,000 bushels of corn, in 1914 (1915 was such an exceptional year, because of the war, the figures did not prove much) our corn exports were reduced to 10,000,000 bushels. In other words, instead of producing so much corn that we had it to sell to the whole world, even with our vastly increased production, we are now growing just about enough corn for our own uses, with little left for other people. With the confidently anticipated increase in immigration at the end of the European war, we confront the day, not far distant, when we will have just enough corn for our own use, with not a single bushel for export.

But, you say, we have millions of acres of waste land that will be available for many, many years to come, which the new peoples from across the sea and the adventurous ones already here can cutivate, to add to our area under the plow and to our production. Yes, my friends, we have vast areas uncultivated today, but I have it on the authority of a government official that all our available land will be exhausted in the next twenty years, at the rate it was taken up and reclaimed last year. We must not sit back and depend on lands not now under the plow; we must be prepared for the time when all our land will be cultivated and increased production will be absolutely necessary if all are to be fed and clothed.

That is why, my friends, I declare there is a preparedness for peace—a food preparedness—that should be occupying your thoughts and mine, the thoughts of those who sit in authority and by the weight of their influence can launch campaigns that sweep the country with enthusiasm. We must see to it that we are prepared for the time when the production of today, large as it is, will not suffice; when we must all be better farmers, making our fields yield to the maximum, that there will not be hundreds of fifteen-bushel corn farmers bringing down the average of those who raise sixty, eighty and even 100 bushels to the acre. It is none too early for some Paul Revere to dash across the countryside rousing the people, not to arms, but to pitchforks and plowshares, so that we may be prepared for the time which now, in our prosperity, we ignore or choose not to see. The man who does this will go down in agricultural history as a prophet who awoke his people to action before it was too late.

THE LESSON OF LINCOLN'S LIFE.

SO LONG as our nation survives, the story of Abraham Lincoln's life will be an inspiration to every farm boy. It is a far cry from splitting rails and poring over books on the puncheon floor of a log cabin, in the dim light from the fireplace, to occupying the president's chair and piloting a nation through stress and storm to the harbor of peace and safety, but because one farm boy did this millions of others are cheered to do their best, no matter how humble may be the only outlet for their ambition. It is a good thing for us that Lincoln's life is not shrouded in any of the historical mysticism that envelops Washington's. It is hard to think of Washington as a flesh-and-blood man; we cannot think of Lincoln in any other way. His rugged, homely face was so human, neither time nor hero worship can make him aught but a man, made of common clay, one of the common people, from whom he sprang.

Once every year, as I prepare this page of mine, I confront the task of trying to bring Lincoln and his life before you in some new light, that you may see him as he was in the flesh: A farmer, loving and honoring farm work to the day of his death. Although his character was many-sided it is a difficult task to bring some new thought to you. Out of the stress and strife and storm that surround us nowadays, when three continents are at war, it seems to me that nothing Abraham Lincoln said showed the greatness of his character and its nobility more, that nothing he ever said so deserves to live in history and be enshrined in our hearts and memories as those epochal words, "Let us have peace." Whenever was there a time when we can so fervently breathe this prayer of the man of peace who was forced into war, who, on another time said: "Fondly do we hope, fervently do we pray, that this mighty scourge of war may speedily pass away." Is there one among us today, as Lincoln's birthday approaches, who cannot or will not echo these words of the martyred emancipator? This is the thought I would give to you on Lincoln's birthday; only a few simple words, to be true, but, oh, how many untold millions of lives hang upon them, what a cloudburst of human blood is held back by them. And, remember, my friends, the man who spoke them was just a common man, like you and me, a product of the soil, a farmer, of whom no truer picture was ever painted than that of the poet when he wrote:

The color of the ground was in him, the red earth,
The tang and odor of the primal things,
The rectitude and patience of the rocks.
The gladness of the wind that shakes the corn,
The courage of the bird that dares the sea,
The justice of the rain that loves all leaves,
The pity of the snow that hides the scars,
The loving kindness of the wayside well,
The tolerance and equity of light,
That gives as freely to the shrinking weed
As to the great oak flowing to the wind—
To the grave's low hill as to the Matterhorn
That shoulders out the sky.

And so he came—
From prairie cabin up to capital.
One fair ideal led our chieftain on.
Forever more he burned to do his deed
With the fine stroke and gesture of a king.
He built the rail pile as he built the state,
Pouring his splendid strength through every blow,
The conscience of him testing every stroke
To make his deed the measure of a man.

So came the captain with the mighty heart,
And when the step of earthquake shook the house,
Wresting the rafters from their ancient hold,
He held the ridgepole up and spiked again
The rafters of the Home. He held his place,
Held the long purpose like a growing tree,
Held on through blame and faltered not at praise.

And when he fell in whirlwind, he went down
As when a kingly cedar, green with boughs,
Goes down with a great shout upon the hills
And leaves a lonesome place against the sky.

That is the Lincoln I love to think of, not a man whose birthday kings remembered, nor a great commander led unwillingly to war, but a man of the road and the country school, a man of the cornfield and the country store, a man so great that when he fell he went down like a kingly cedar, leaving a lonesome place against the sky.

We mark the lowly place where he was born,
We try to dream the dreams that starred his nights
When the rude path that ran beside the corn
Grew to a fair broad way which found the heights;
We try to sense the lonely days he knew,
The silences that wrapped about his soul
When there came whispers tremulous and true
Which urged him up and onward to his goal.

THE WISCONSIN FARMER

A WEEKLY JOURNAL OF AGRICULTURE, HORTICULTURE, STOCK RAISING AND ALLIED INDUSTRIES

BY JAMES M. PIERCE

JAMES ATKINSON, Editor-In-Chief

ESTABLISHED IN 1848

Entered at Des Moines Postoffice as second-class matter

PUBLISHED EVERY THURSDAY

1912 Grand Ave. Des Moines, Ia. | 201 Washington Bldg. Madison, Wis.

To either of which communications relating to subscription or advertising may be addressed.

MEMBER AGRICULTURAL PUBLISHERS' ASSOCIATION
MEMBER AUDIT BUREAU OF CIRCULATIONS

SUBSCRIPTION RATES—Single subscriptions, $1.00 a year. In clubs of ten, 75 cents a year and an extra copy to getter up of club. In clubs of fifty or more, 25 cents a year. Single subscription three years in advance, $1.50; five years in advance, $2.25; ten years in advance, $4.00. Subscription prices in Canada, $1.50 a year. Remit by draft, registered letter, postoffice or express money order. In changing address, send both the old and new addresses. In renewing, give the same name and initials as you gave before or state both the old and new names, and explain why you make the change. In case of errors or failure to receive the paper within two weeks, promptly notify the publisher. Address WISCONSIN FARMER, MADISON, WISCONSIN

Be Liberal on the Farm Home.

THERE should be more attention paid to the farm home. It is, of course, very easy to make a statement of this kind and very pleasing no doubt to those who have home building materials for sale. But the matter should be viewed rather from the standpoint of the value which may be derived from a good farm home property. This value is represented in several very important ways, including health, happiness, comfort, ease and pride. We fail to realize at times how closely these things are related. Those who have enjoyed a good, convenient farm home, modern structure in a proper setting of trees and shrubbery, are better able to understand.

A good farm home under present conditions may be built for $2,500 to $5,000 or $6,000. The cost will depend largely upon the finishing. It is nice to have an interior of solid oak, but it is not necessary. A home may be comfortable—yes, it may be beautiful without the most expensive finish. Plumbing bills may run into large sums, but good, substantial plumbing minus some of the nickel trimmings may be secured at quite reasonable cost.

The decision as to the walls of the house, whether they shall be frame, brick, hollow tile or other construction will have most to do with the ultimate cost. Square houses, as a rule, give the maximum of house space for cost, everything considered and when angles and odd-shaped roofs and frills are added they will appear in the total bill of cost.

Fireproof construction is desirable for farm homes, but it is relatively more expensive than wood. If one is to build a large house from absolutely fireproof materials the cost will run up. Frame construction will be the usual method. Those who are able to pay for heavier construction will be well pleased with the added expense. A plaster or stucco finish, put on over metal lath is desirable and beautiful. It is well for the prospective builder to consider these materials, their relative cost and efficiency.

There are a few things in connection with modern home building which should not be overlooked. A sleeping porch may be planned in connection with the original building operation and it will not be much additional cost. Good wide porches are desirable even where the lawns are well shaded. Give the house sufficient elevation to get the breeze and give the proper ventilation to the cellar. Put in a furnace of some kind. It is the modern way of getting even heat, and the furnace should be considered as a part of the house plan.

Don't forget that there are many uses for a good cemented basement. Here's a chance for the washroom and for a good vegetable cellar. Seed corn can be dried in the furnace room. A good furnace means an even temperature throughout the house. It means that more than one room may be used in comfort throughout the long winter days and evenings. Running water in the house ought to be a subject for discussion along with the house plans. This makes a bathroom possible and this is the era of the bathroom. The farmer who intends to build a home should take a little time to study over these things, figure out what conveniences he can afford, and build the home for the future comfort and happiness of the children and of himself and wife when they are old.

It is not possible to put into the home every good thing which will be suggested. Hark back in memory to the hot summers and to the cold winters, to the heavy rains and the big snows, and many notions will come up in the mind concerning the building of the home. Do not be niggardly in erecting the farm home. Every dollar spent in a good home is well spent, provided, of course, that materials and workmanship are properly bought and reasonable plans are adopted. Large barns represent prosperous farms. Good, substantial homes add just as much to the sale price of the farm as any other class of farm buildings. The expense put into the home place must not be looked upon as money sunk. It may be the means of keeping those boys and girls on the farm, or preserving the health of the family. We do not know of any farmer who has a good, substantial home, who will say that he made a poor investment. We know a good many farmers who have twice as much invested in their homes as the size of their farm would seem to warrant, but who are well satisfied and wouldn't stint a bit if they had the home to build over again.

Youthful Wisconsin Alfalfa Grower.

THE publisher of The Wisconsin Farmer has received a very beautifully written letter from Harold E. Parsons, of Portage county, Wisconsin. He is twelve years of age and in the seventh grade of the Plover, Wisconsin, graded school. His letter is of exceptional interest to us because it tells of his experience in raising alfalfa, and this same alfalfa took first prize at the boys' and girls' contest held in Stevens Point, Wisconsin, October 29, 1915. In order that other boys and girls in Wisconsin may know something of what this twelve-year-old boy has done, his letter is published herewith:

In the spring when papa plowed his garden he plowed a piece of ground that used to be a chicken park. He was going to plant it with potatoes, but when I got my alfalfa seed he said I could plant my seed where the chicken park used to be. After the ground was plowed I raked it over two or three times so as to break the lumps of sod. I planted my seed rows about eighteen inches apart. The piece of ground in which I planted my alfalfa was twelve feet long and ten feet wide. I planted my seed about the middle of May. My rules said to plant the seed between the first and the tenth of May, but it was too cold for the seed to sprout. I planted it about two inches deep. When my alfalfa was about three inches high I pulled all the weeds out, little and big. I weeded it once a week until it was about ten inches high, and then I weeded it once in two weeks. I had a hoe similar to a cultivator. It had three teeth and was just right to cultivate between the rows. I cultivated the alfalfa from two to four times a week. I cut my first crop the twelfth of august. When I cut my alfalfa I took it in the barn and spread it out on the floor to dry and let it lay there about a week. I had about forty pounds. When it was nice and dry I took the best of it and tied it up in a bundle about four inches in diameter. The longest of it was about two feet long. I cut my second crop in the middle of September. It was not in blossom so I didn't save it. It grew to be only about ten inches high. It was about fifteen pounds.

Attracting the Settlers to Wisconsin.

GREATER interest is being manifest this winter in the newer lands of Wisconsin, and the present year will probably see more settlers come into this state than ever before. Men able to buy higher priced lands in old-settled communities are buying and developing new lands in central and Upper Wisconsin as well as men who are coming to this state to make their stake, unable to purchase the higher-priced lands in other communities. They have seen the clover growing wild in the cut-over districts and are convinced as to the fertility of thousands of acres still to be put under the plow, and as they are urgng neighbors and friends to locate near them a greater influx of new citizens can be expected and more Wisconsin land will be made tillable.

So it is timely that such a bulletin as "A Personal Word with the Homeseeker" should be issued by the state department of agriculture for the bringing in of these settlers and then seeing that they are properly located is one of the big problems of the state. This pamphlet has just been issued by B. G. Packer, director of the immigration bureau, and it is one of the best bulletins that has been issued in some time, setting forth the great future of the undeveloped lands of the state. It is profusely illustrated and the various farming topics as well as everything the prospective settler wishes to know, such as climate, soil, transportation, etc., is set forth in a clear, concise style. Its purpose is well set forth in the following paragraph from Mr. Packer's introductory in which he points out that the settler's interest is the state's interest:

This pamphlet is issued with the homeseeker's interest kept in view first, last and all the time. The writer has no seductive stories in big profit in farming to tell you. Where crop returns are mentioned only averages are used, and these obtained from impartial sources, then reviewed and verified. The division of immigration has no financial interest in the sale of lands, but every assistance is offered that will lead you to discover the exact locality you would prefer. Write us in detail about your plans. In adding to the farm wealth of Wisconsin it is the purpose of all forces, public and private, to build from the bottom up, and not from the top down. Your welfare and the state's interest are one and the same thing.

The bulletin sets forth what is being done with the great undeveloped lands and what can be done. There are wonderful opportunities in central and upper Wisconsin, and the state department of agriculture is anxious that the settler get started right so that he will succeed. It would be folly to attract homeseekers to this state with a lure of great riches and wonderful returns and then have them fail; have them tell their friends and neighbors to avoid Wisconsin. As Mr. Packer correctly states, hard work, patience and some cash capital are required to fit new land for crops in any state, and Wisconsin is no exception. Most well-to-do Wisconsin farmers began with small means and without the credit, transportation and markets found today. But the soil was good, and because it was good, combined with their thrif and enthusiasm, they made good. Thousands o settlers are winning out today just as their fore fathers won out, and the opportunities are unlim ited for the man who buys right, starts right works right and lives right.

The bulletin has been issued with the view o interesting the prospect. It sets forth the grea advantages of the state and it should prove a grea assistance to the landowners who are bringing i new citizens to develop that land. The interes of that department is in getting the homeseeke settled right so that he can win out. It desires n failures. A successful settler means more devel oped lands, greater farm profits, a greater stat and greater prosperity.

The question of finances is one which usuall confronts most of the homeseekers. They ar seeking a newer country where the lands ar cheap because they can't afford the higher price lands in the well-developed communities. But, a Mr. Packer sets forth, the new settler's capital i certainly not to be measured wholly in dollars an cents. His earning power must be considered an the active man will find employment, if necessary in most sections of the state. The amount o money needed depends upon the extent and con dition of land purchased and how he goes at the job. More especially does it depend upon the man his wife and their habits of thrift. One thing i certain—the new settler should not put all his funds in land, for it is well to reserve some for buildings and provide for clearing. These build ings need not be costly, and no state offers better opportunities along this line, as lumber is cheap in the cut-over country, and if thought best log buildings can be put up at the cost of erecting them. Then there is the additional income that can be secured the first winter from the sale of bolts, fire wood, etc., and the profit in summer from the cash crops, such as potatoes, cabbage, etc., which are good producers in the new country.

Many Counties Can Profit by Waukesha's Example.

WAUKESHA COUNTY, which is undoubtedly the best-known county from a dairy standpoint in Wisconsin, is entitled to the fame it has won as a dairying community. There is no reason for any county to be jealous of the position Waukesha has attained, for this position has been earned by her breeders who are setting an example for those of every other county when it comes to enthusiasm and progressiveness. For real live dairy organizations the writer believes Waukesha county beats them all, but what Waukesha has done can be done in any other county. This county has no patents or copyrights on cooperation and enthusiasm. Her breeders have put her on the dairy map because they saw in co-operation the organization that the greatest good could be accomplished and every breeder was ready to put a shoulder to the wheel.

There is much that any breeder may learn in Waukesha county in addition to how to breed fine dairy stock. He can learn the value of organization and the fact that the Guernsey association, which has been highly organized for ten years, can report an increase of membership during the last two years that is the greatest in any two years, speaks volumes for the permanency of community organizations properly conducted. The Guernsey breeding industry is the most highly developed agricultural industry in the county because ten years ago a few breeders with an enthusiasm that was deep seated and unselfish brought the Guernsey lovers into an organization. Two years later the Holstein breeders united and are vieing with the Guernsey breeders for first honors and contributing their share to making Waukesha county the dairy capital of America.

Often the writer has been asked why these Waukesha county associations have succeeded so admirably. That question could have been answered by anyone who attended the two annual meetings this past month—the Holstein and the Guernsey meetings. From the moment these gatherings were called to order there was enthusiasm and lots of it, They were community gatherings in the strictest sense—gatherings to which mother and the children attended as well as father and son. At noon each association served a banquet which would delight the best business man's organization in Wisconsin. To this festive board they brought the best speakers obtainable—men from whom they could learn and profit, all of which was interspersed with the best of vocal and instrumental music.

The result is that these annual and also the summer meetings have become social as well as business occasions. They are something for the entire family to attend. The day is a grand holiday; an outing for mother and the daughters with no dinner to cook; no dishes to wash; nothing to do but enjoy themselves. We all know how the mother enjoys a change from her own cooking; how she likes to eat someone else's cooking. And with a banquet like that served at Waukesha nothing was left undone from the eating standpoint. The result is that everyone returns home at night refreshed from a day's outing; imbued with the enthusiasm of the meeting; richer in the good things explained by the speakers. While the mind has been refreshed with music and visiting and the inner-man satisfied the business has been trans-

acted and the interest in the association and its work increased.

The Wisconsin Farmer wishes every county in Wisconsin might boast of such organizations as are flourishing in Waukesha county. Many of our counties have such associations but they lack the vital thing—enthusiasm. They also need leaders, for without men who are willing to give freely of their time to carry on the work any organization will perish. Waukesha county has been fortunate in having leaders—it is also developing leaders so that the men now active can retire and watch the work go on under the direction of new leaders. Waukesha county has shown the state what these community organizations can do; it has shown the state how to interest the entire families; how to make the meetings appeal to all. The question is whether more counties will profit by Waukesha's success.

Sheboygan County, Wis., Makes a New Record.

SHEBOYGAN county is rapidly forging to the front in official testing and during the past two weeks a new production record for butter fat has been set for that county. Vickery Vale Beechwood, a Holstein in the herd of Emil Titel at Plymouth, has just completed a 365-day official test, during which time she produced 980.54 pounds of butter fat in 26,050.7 pounds of milk. Mr. Tittel has several other cows in official work which have not yet completed their year's records, but the record thus far completed indicates heavy productions.

This production of 980.54 pounds of fat is the highest official 365-day record ever reported from Sheboygan county and indicates the high quality of cows which are being bred now in that community. Only a short time before the record of Vickery Vale Beechwood was completed a cow in the herd of Harry Keach at Glenbeaulah, Pearl Longfield De Kol, produced 972.084 pounds of fat from 28,050.5 pounds of milk. This was also an official 365-day Holstein test, and several other of Mr. Keach's cows now under test will produce near this mark. These tests will be completed during the next few months. The Keach record is only a few pounds below the Titel record, and for a time there was a race between these two Sheboygan county dairy queens as to who would produce the most fat in the year.

There are approximately 40,000 Holstein cows in Sheboygan county, and the records of Mr. R. T. Harris, at Madison, supervisor of official tests, shows more interest in official work in that vicinity than ever before. There are some splendid Guernsey and Jersey herds in the county, but the Holsteins have the advantage in numbers. These two official records, only recently completed, emphasize the growing importance of the pure-bred, high-production dairy industry in that county.

Better Dairying in Dane County.

AN INCREASED interest in dairying in the tobacco-growing sections of Wisconsin is indicated by this inquiry from one of our valued readers, Mr. Bert Chappell, of Dane county:

"The farmers in the vicinity of Stoughton wish to form a dairymen's association for the purpose of awakening an interest in the production of better and cleaner milk, the raising of better stock and also for procuring a better market for milk. We wish to ask you to give us a few ideas how to get started. What would be a reasonable amount to pay a secretary?

Can you give us the address of any dairy company that would be likely to make use of our whole milk? There is no sentiment here for a co-operative creamery. We have had a rather favorable correspondence with the ———— company of Chicago, but they seem to be somewhat doubtful of this tobacco region, hence our desire to form an organization to keep up the dairy interest.

"While thanking you in advance for your reply, allow me to express my personal appreciation of The Wisconsin Farmer and more especially your editorials."

The farmers of the Stoughton vicinity are certainly on the right track, and an organization, as Mr. Chappell suggests, would no doubt be a powerful influence in increasing the dairy farmers' profits by encouraging the production of better milk and in finding a profitable market for this milk. The initiative for such an organization must come from the farmers in that vicinity. Our advice would be for a dozen or more farmers to get together; start an association, and if properly conducted and begun it will gather influence as time goes and outside assistance can be secured from the college of agriculture and the state food and dairy commission. Either will be glad to send good speakers and organizers to help the work along, but local farmers must take the initiative and certainly there are a sufficient number of public-spirited dairymen in that community to do this. We do not know of any secretary receiving a salary for such work as this and there is in almost every community and certainly in the Stoughton community some man who is willing to devote his time without compensation to the upbuilding of such an industry. Of course, the secretary should be reimbursed for any expenses such as postage, etc., which might be incurred. The first thing to do would be to canvass the farmers; learn how many are interested in such a plan and then call them together for organization and selection of officers. The college of the dairy and food commission would be willing to send a man to assist in perfecting the organization.

Stoughton should have a creamery. There is in that vicinity many dairy farms from which the milk and cream is being shipped to outside markets. If such an organization as outlined above were started it would attract outsiders, and if the farmers did not wish to start a creamery cooperatively someone from the outside would come in and take hold of such a proposition. A creamery in Stoughton, conducted properly, would be a big boon for that vicinity, for it would no doubt be followed by a cow-testing association with the result that the farmers would begin to sell off their boarders; would get a better price for their milk and would likewise produce a better product. It would also mean that the skim milk would stay on the farms.

The Chicago dairy company with which the farmers are now corresponding could dispose of their whole milk very easily, and to the advantage of the farmers if they decide to take this milk. It is true many of the big city milk companies are afraid of the tobacco farmers as they have, naturally, devoted their attention principally to tobacco raising, but, as more and more of them are taking up dairying each year, this prejudice should soon be forgotten. If the Stoughton farmers, after organizing, decide not to start a creamery they could probably find in Milwaukee a splendid market for cream, as one of the big dairy companies there is now paying 8 to 9 cents a pound above the Elgin market price for butter fat. This, it seems, would be better than shipping the whole milk, as it would leave the skim milk on the farm, and this is an important item with corn high in price and feed short. Skim milk is worth half as much per hundred pounds for feeding purposes as a bushel of corn, and in this vicinity there are many hogs, calves, etc., which can use this milk to advantage. In the second place the farmer can profit just as well by skimming and selling his cream, and he does not have the large expense of transportation that is present when shipping whole milk.

These matters could all be threshed out after the milk producers had organized and speakers had been brought in to explain the problems confronting the farmers. Such an organization would go a long way towards boosting the farmers' profits, if rightly conducted, not only in finding the proper market but by increasing the milk production through interesting the farmers in keeping better cows, and up-to-date dairying methods.

Implement Wear Due to Rust and Decay.

MACHINES make money for you when they are in use; they cost you money when they stand idle.

A machine makes the greatest possible profit for its owner when it is used continuously in profitable work till it is worn out. Then it is really worn out—it does not rot or rust out.

The average farm implement is only about half worn out by use alone. The rest of the wear is due to rust and decay.

Acres count in the life of a machine—not years.

These are some of the striking facts about machinery emphasized by a recent study conducted by the United States Department of Agriculture.

It was found that the cost per acre covered is the real measure of the value of the service given by an implement, and that, on the average, the more acres covered per year, the more profitable it proves to its owner. For example, it was found that for the territory surveyed, the mower that covers but fourteen acres per year cost its owner thirty-six cents per acre, while the mower that covers fifty-three acres annually cost but ten cents per acre cut.

Of the implements studied, the walking plow shows the longest life in days of service, 224 days out of a total life of twelve years, while the two-row corn planter shows the shortest life in days of service, nine days out of eleven years, or about nine-tenths of a day per year. The cost of the walking plow was less than ten cents per acre, mostly for repairs, while the cost of the two-row corn planter was eighty cents per acre, mostly "replacement cost" or the amount charged against the implement each year toward getting a new one when it is scrapped.

This investigation was made in an eastern state and the findings, therefore, only apply in a general way to corn-belt conditions. For example, it was found that the disk harrow was used only 4.2 days during the year, while the spike-toothed harrow was used 3.1 days. In the central west each of these implements would give three or four times this amount of service every year. Where the investigation was made, the life of the disk harrow was thirteen years and the spike-toothed harrow fourteen years, during which the former was in use fifty-four days and the latter forty-three days. It goes without saying that this class of implements and, indeed, all classes of implements are built strongly enough to give many times this service and the fact that they are worn out in so short a time must be very largely due to rust and decay. The grain binder, according to this report, is used an average of 3.4 days in the year and it lasts for 15.4 years, doing only fifty-three days' work until it is discarded. Binders can be found in the wheat belt that have cut all the way from 500 to 1,000 acres of small grain, thus showing that where they are really taken care of they will give ten times the service that was revealed as the result of this investigation.

Put the Lease in Writing.

WE ARE not in favor of verbal leases. Even the best of friends in a matter of this kind are much more apt to remain friends if each party signs a contract that defines somewhat in detail the condition under which land or other property is leased. This topic is suggested to our minds by a number of communications that have been received recently from men who are in a "stew" over the action of their landlord on the one hand or the tenant on the other.

In one case a verbal lease was made for one year, the tenant to pay share rental. Nothing was said about the pasturing of the stalks, and just as soon as the tenant turned his cattle into the stalk field he had trouble on his hands there and then. The landowner in this case was stubborn and threatened the tenant with all sorts of dire disaster if he turned his cattle into the stalk fields, and the matter was being wrangled over at the time advice was asked by the tenant.

Another instance gives a view of the matter on the share plan as applied to the live stock as well as to the crops. The relation of the two parties in this case was such that each expected to extend the term of the lease at the end of the year, but the renter purchased another farm and the problem of settlement came up involving a division of the live stock. The landlord maintained that there could be only one satisfactory method of appraising the live stock and that involved the holding of a public auction sale, but at the same time he refused to bear any portion of the expense involved in this sale, claiming that the action of the renter made the sale necessary and he, therefore, should bear the cost.

Other instances have been presented, involving the matter of repairing fences. One case in particular indicated that no fence on the farm was in condition to restrain live stock and the question came up as to who should pay for the new wire as well as the posts and also who should bear the labor cost of putting in the new fence. These matters were not touched on in the lease and they were, therefore, a source of annoyance sufficient to create an antagonistic feeling between renter and landlord.

It is no easy matter to draw up a lease that will cover all emergencies, but the important fact to be kept in mind is that under no circumstances should any individual undertake to handle land with nothing more nor less than a verbal arrangement with the landowner. Furthermore, specific reference should be made in every lease to the matter of keeping buildings and fences in repair, and the terms of the lease should make suitable disposition of the cornstalk ground, straw and materials of that kind. When both parties to the contract are prepared to exhibit good common sense under all circumstances the lease becomes a secondary matter entirely and we have known instances where neither landlord nor tenant would have occasion to read the lease for years after signing it. However, the cases where dissatisfaction is apt to arise are sufficiently numerous to justify specifying somewhat in detail the conditions under which the landlord and the tenant operate.

Burning Coal Economically.

THE service one secures from a furnace depends to a large extent upon the skill with which it is managed. Where soft coal is used one must be very careful to keep the air passages free from soot so that there will be enough draft to burn the coal as completely as possible. Crowding a fire results in loss of fuel because it tends to distil off gases in an unburned condition. Keep the furnace burning slowly and as evenly as possible. The following suggestions from the superintendent of the power plant of the Kansas agricultural college are timely and to the point:

It is also economical to charge the furnace frequently with comparatively small amounts of coal, as otherwise the fuel bed will become too thick and a large amount of coal will be driven off in the form of unconsumed gases. This condition probably has been experienced by nearly everyone who has fired a furnace. Gas accumulates and sometimes even causes small explosions.

Cover the fire with one and a half to two inches of fresh coal, or put a thin layer on one side and much more on the other, so that the air passing through the hot coals will mingle with the gases that are distilled from the green coal. This will make the gas hot enough to burn. The proper regulation of the damper has much to do with the economical way of burning coal.

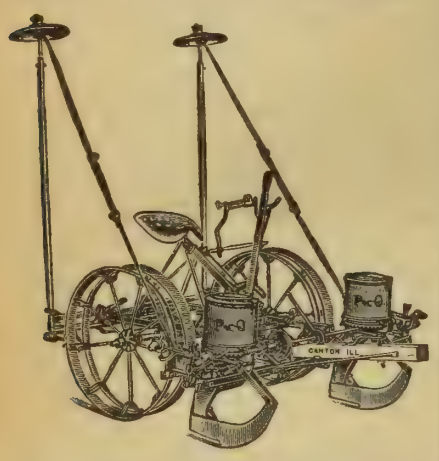
Under general conditions nut coal gives the best satisfaction in the furnace. Screening or fine coal packs too closely; lump coal usually forms a fire that is too open for best results.

Those who are contemplating putting furnace heat in their homes should give the selection of the kind of furnace very careful attention. It is also well to remember that the first cost is not an item of so much importance as is the service the furnace will render and the economy with which it can be operated. A saving of $10 a year in coal bills mounts up to a large sum in the course of ten or twenty years.

P&O

Variable Edge Drop Corn Planters

Furnished with 30 or 36 inch wheels, concave or open center, adjustable to all standard widths with wire to match, according to local requirements. Can be furnished with Flat Drop Attachment, Fertilizer Attachment, or Pea and Bean Attachment. Double disc markers. A perfect stand of corn is assured with a P&O Planter. "It's the Way We Build Them."



The variable drop can be changed instantly, without stopping the team, to plant 2, 3 or 4 kernels to the hill. The simplest variable drop found on any planter; easily operated from the seat; the driver operates it with his foot. Ample tongue adjustment for any sized team. Reel can be used on either side. Large hoppers, easily tilted to change plates or remove corn; plates can be changed without emptying hopper. Hoppers are the combination type; flat drop plates may be used. Can be instantly changed from variable hill drop to variable drop drill. Sight feed, without glass; unobstructed view.

Regular runners, stub runners or disc furrow openers can be furnished. Dropping mechanism perfect; congestion is impossible; valves carry one hill in reserve and hill cannot be doubled. Plunging motion of lower valve forces seed out without scattering. Cushion spring at end of the tongue keeps the proper tension on front frame in uneven ground. Every planter is actually tested with seed in the hoppers before leaving the factory. P & O Planters are the simplest and strongest made.

We also make Flat Drop Planters and Drills, Bean Planters and Kafir Corn Seed Plates.

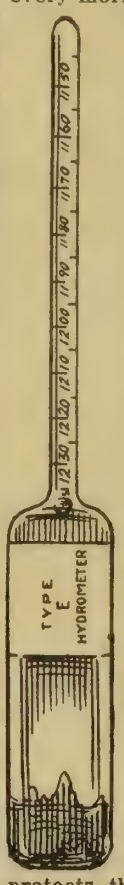
RURAL ELECTRIC LIGHTING.

An Inexpensive and Practical System of Illuminating the Home—By E. C. Sauve, Wisconsin Experiment Station.

ELECTRIC lighting on a farm is now a practical possibility. Judging from statements made by owners I know, electric lights for the farm home are no strain on their pocketbooks. Through personal interviews and lists of questions I have obtained from several owners of rural electric lighting plants information in regard to their manner of operating and expressions of opinion as to their practicability. One man, who has a thirty-two volt lead battery, says: "Our plant is a large one. We have about eighty-five lights, run a washing machine and do the ironing. A plant half the size would be sufficient for an ordinary farmer. We have had no trouble and have not spent a cent on it since the time of installation. The plant has been in use two years." Another, who has a thirty-two volt Edison plant, writes: "I think electric lighting on the farm is very practicable. I have about thirty-five lights and I believe it does not cost me to exceed 2 cents per day for charging. Plant has been in operation over one year." A third, owner of a thirty-two volt lead battery, says: "We cannot do without our plant. We run a washing machine, vacuum cleaner and flat iron and can do any work that is done with 110 volts. Plant has been in use twenty-two months." The superintendent of a county poor farm writes: "Our plant has been in use for four years and we have to renew the plates which will mean an expense of about $150. (This is expensive lighting). The battery is charged every day from morning until bed time and then we are in darkness every morning until I start the engine. We had the cells cleaned a year ago. We have had the generator commutator turned up twice in the four years of use." These statements are the common sentiments expressed by users.



The following parts are included in the make up of a lighting plant: Battery, dynamo, switchboard and accessories, engine and wiring. A battery consists of sixteen, nineteen or twenty-four cells, or storage units, the number depending on the arrangement of cells and the kind used. Each cell is made up of a container, electrolyte or solution and two or more plates. These figures apply to the thirty-two volt system which is commonly used on the farm.

Some batteries are made up of open cells and some of closed or sealed cells. The open cell with the glass container, used in stationary work only, has the advantage that the operator can note the condition of the cell at all times and should one or more cells become disabled they can be easily replaced. A glass cover protects the electrolyte from the impurities of the air. The closed or sealed cell is used largely for portable work, such as the automobile, the railroad train, electric trucks, etc. It is also used in rural lighting plants. A disadvantage of the closed cell is that the density of the solution cannot be so easily determined, it being necessary to pour the liquid into an open vessel before the hydrometer (see Fig. 2), which is the instrument used in measuring density, can be inserted. The plates of this cell are not accessible to view and when it is no longer serviceable it is often discarded. However, in the hands of experts the worn out closed cell can be rebuilt and put in as good condition as a new one. Each kind of cell has its advantages and disadvantages and must be selected to best suit the purpose.

Until recently lead batteries were used almost exclusively and many of the plants now in use are of this kind. A few points to be considered in caring for this type of plant are location of battery, the electrolyte or solution, charging, discharging, efficiency, depreciation and troubles.

The battery room should be dry and well ventilated and the temperature should be moderate, 40 to 70 degrees Fahrenheit. The rays of the sun should not be allowed to strike the cells. Excessive heat, over 90 degrees Fahrenheit, causes rapid evaporation of the electrolyte and injures the plates. Extreme cold is also to be avoided. All equipment of the battery room must be acid proof, that is, walls, ceilings, floors, etc., should be of brick or tile, the floor having a drain. Wooden floors, iron work, etc., may be rendered acid proof by a coat of asphaltum paint.

There is considerable variation in practice as to the strength of the electrolyte or solution used. Chemically pure sulphuric acid is poured into distilled or rain water until the density is approximately 1.2. A hydrometer is used in determining this density. Every plant owner should have one. Water should never be poured into the acid and care must be taken that the plates are completely covered, at all times, by the electrolyte.

If charging is not begun immediately after the electrolyte is placed in a new cell the plates are likely to become sulphated, that is, a whitish non-conductive scale is formed on the plates, which affects their life materially. The first charge should be at such a rate that the temperature of the cell will not reach $100 degrees Fahrenheit. This is not true of subsequent charges. Overcharging, as well as overdischarging, of the battery is to be avoided, for under these conditions the battery deteriorates rapidly. In the observation of the writer overdischarging is a more common error than overcharging. If we consider a standard voltage of thirty-two of the rural plant at a full charge will get about thirty-five volts maximum and at a complete discharge a reading of twenty-eight volts will be obtained. A dimming of lights will be noticeable beyond this point of discharge and the battery should be recharged as soon as possible. It is much better to avoid discharging to this critical point.

Often a battery is left unused for months at a time, resulting in deterioration. If a plant is to be idle for a considerable time it should be put out of commission in the following manner: Give the battery a full charge until the cells are gassing freely and the hydrometer reading ceases to rise. Remove the sulphuric acid solution by syphoning or by emptying after the plate couples have been removed one at a time. Avoid delays while plates are exposed to the air. Put plates back in jars. Replace the solution with water and leave the water in the jars for about twelve hours. After the water has been removed the plates may be allowed to remain unused indefinitely. When ready to use again fill the jars with new, or with the old acid, and charge as in the case of a new battery.

The efficiency of a lead storage battery is said to be about 90 per cent when new. That is, 90 per cent of the charge given is available for use. Experience shows that the battery depreciates with use more or less rapidly according to the care given it. One authority says that the depreciation of the lead battery is about 7 per cent per annum, meaning that at the end of about thirteen years the battery would have to be entirely renewed.

Chief among the troubles met with in the operation of the lead battery are sulphation and short-circuiting. The former results in buckling of the plates and disintegration of the active material of the positive plate, and is indicated, as before stated, by the presence of a whitish scale on the plate. Sulphation, if but slight, may be corrected by giving the cell or cells affected, a long charge at a low rate and only partially discharging. This process should be repeated until the sulphate is gradually eliminated. If sulphation is more pronounced it may be necessary to scrape the plates before applying the treatment outlined above.

Buckling may be corrected by placing the warped plate between boards and subjecting it to pressure or by tapping it gently with a mallet. The pressure method is preferred, as less likely to injure the plate.

As the battery is used sediment will form in the bottom of the jar. This must not be allowed to accumulate so that it will touch the plates, for then short-circuiting and rapid deterioration will result.

The nickel iron battery, now coming into general use, has many points of superiority over the older types. After a number of years of experimenting this battery has been placed upon the market and seems to be in general favor with its users. It was constructed with the idea of eliminating all the defects of the lead battery. Tests which ordinarily would be destructive to other types were conducted and the results were favorable. The nickel iron battery is, however, not without its disadvantages. Due to the nature of the electrolyte used in this type of battery freezing takes place at a higher temperature than in the case of the lead battery solution. Low temperature weakens this plant materially, but it can be recuperated by application of heat. Experience has shown that there is considerable variation in voltage from full charge to complete discharge and the lights are affected to the extent of voltage variation. However, this may be avoided by charging and discharging daily to meet the demands of the day. The nickel iron battery is not injured by errors in charging or discharging as is the lead battery. The writer has examined an Edison storage battery which has been in use about seven years and which is still doing satisfactory work. The construction of the nickel iron battery renders its efficiency somewhat less than that of the lead battery. The first cost of this type of plant is greater than that of the lead battery equipment, but practically no expenditure for upkeep is required.

The dynamo, or generating unit, is that machine which produces the electricity. A knowldge of the following parts will be helpful. The armature is the part that rotates. The commuta-

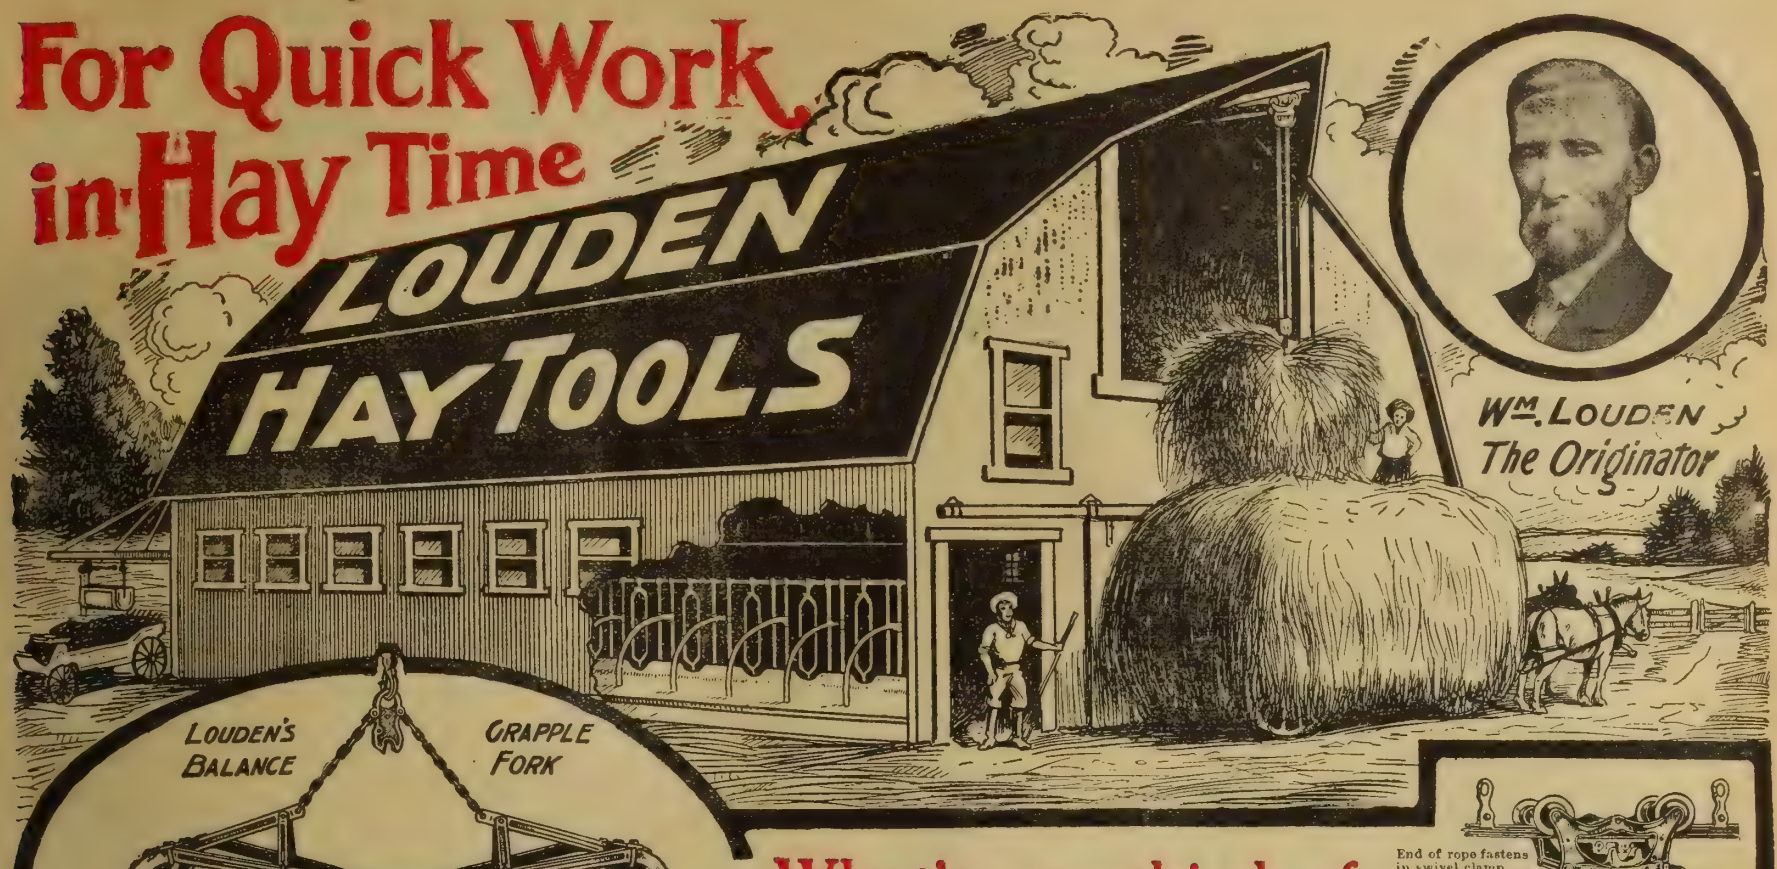
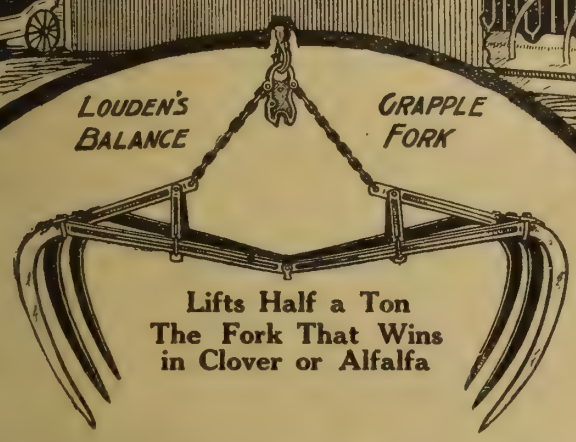
COSTS BUT A FEW CENTS A DAY FOR CHARGING.

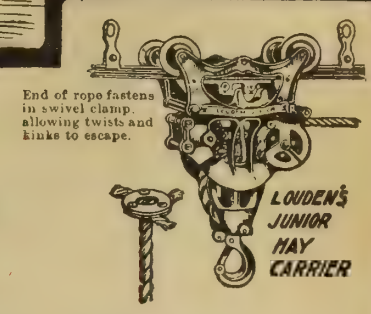
For Quick Work in Hay Time





Lifts Half a Ton
The Fork That Wins
in Clover or Alfalfa

What's one-third of your time in the hay field worth to you?



LOUDEN'S HAY TOOLS will save it. Will enable you to move bigger loads easier and faster than in any other way—avoid the danger of delay which often lets the rain catch your hay down, spoiling it for use or sale.

THE LOUDEN BALANCE GRAPPLE FORK

Set Louden's Balance Grapple Fork across a load and it will take the entire width of an eight-foot rack at a single lift. Half a ton at a time will not strain it. You can put away the biggest load in five minutes. Moves straw, alfalfa or clover as clean as timothy—grips it tight; no scattering or dribbling. WHAT OTHER HAY FORK WILL DO THIS? Built of the finest steel, especially made for us. Light, strong, perfectly balanced, never fails.

THE LOUDEN HAY SLING

Is the tool you want for heavy work in short forage. Its factory test is 3,000 pounds. Will handle anything in the way of roughage without waste. Nothing to beat it as a time and labor saver.

LOUDEN POWER HOIST

Works with all of Louden's Hay Tools. One man operates it from the load—takes the place of horse or team on the draft rope; saves you $5 a day, when used with a Louden Carrier Fork or Sling. It's simple, smooth running, powerful. Operates with steam, gasoline engine or electric motor. Will MAKE GOOD wherever hoisting power is needed.

THE LOUDEN JUNIOR HAY CARRIER

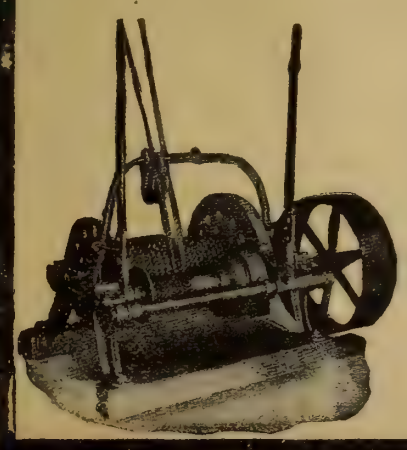
Is absolutely reliable in its operation at all times, because its mechanism is simple and perfect. No loss of time through tangled, twisted or kinking ropes; no letting back the load because of failure to register; no running to town for repairs.

THE LOUDEN HAY CARRIER is a swivel carrier, equally satisfactory in end or center hoist. It's automatic; always drops your hay where you want it; distributes it evenly; will fill your loft clear to the peak, dragging its load over high beams without a hitch. You can put tons more hay in the same space.

Nothing Can Ever Interfere with the Smooth, Easy Operation of Louden's Bird Proof, Double-Flexible Barn Door Hanger.

Sparrows are banished. Snow, ice, rain or trash can't make trouble. One piece of steel, pressed into tubular shape, completely encloses smooth, level track. Center-hung on roller-bearing Tandem Trolleys makes it easy for a child to move. Flexible construction prevents breakage by crowding stock. Carries the heaviest doors. Lasts as long as the barn—always on the job. The ideal hanger for barns, garages, factories or any place where easy sliding doors are wanted.

The Louden Hay Tools are dependable at all times. They cost little, save time, save labor, save the crop. They are money makers from the start, in the field and at the barn.



The Louden Line of Sanitary Barn Equipment Includes:

Litter Carriers	Feed Trucks	Garage Door Hangers	Cow Pens
Feed Carriers	Cow Stalls	Manger Divisions	Calf Pens
Milk Can Carriers	Water Troughs	Hay Barn Equipment	Bull Pens
Harness Carriers	Water Basins	Feed Racks	Hog Pens
Weather Vanes	Mangers	Power Hoists	Sheep Pens
Barn Door Hangers	Horse Stalls	Feed Boxes	Cupolas
Hay Carriers			Ventilators

Books on all Louden Equipments free. See your dealer, or write us direct.

The Louden Machinery Co., 1701 Court St. Fairfield, Ia.

TO PROGRESSIVE DEALERS Dealers who want the big Hay Tools and Barn Equipment business will find it easy to sell The Louden Line. Farmers want them because they know them. There is a steady growing demand for this line. Nationally advertised for 20 years. Get your share of this profitable and growing business. Write for full particulars.

ATLAS EXPLOSIVES

Break Stumps to Bits With Farm Powder

A *pulled* stump is hard to handle, and it takes up more room than it did before. *Blast* it out and you can carry it away like kindling wood. "Most stump pulling machines are too expensive and unwieldy," says U. S. Farmers' Bulletin No: 150. Use

Atlas Farm Powder
THE SAFEST EXPLOSIVE
The Original Farm Powder

and save money, time and labor. Punch a hole under the stump, load, fire, and the job is *done!* The shattered roots come out free of earth, the soil is loosened for yards around—ideal for crops.

Atlas Farm Powder is made especially for farm use. It is the cheapest farm hand for blasting stumps and boulders, digging ditches and many other kinds of work. Sold by dealers near you.

Send for "Better Farming" Book—FREE
"Better Farming" (illustrated) tells how you can grow bigger crops by blasting the subsoil, how you can bring orchards into bearing two years earlier, and how Atlas Farm Powder replaces expensive labor. Sent free for Coupon.

THE HAPPY FARMER TRACTOR CO.

Great Value for Tractor Buyers—$550

Happy Farmer Tractor—powerful—but extremely light in weight—$550. Low price made possible by great simplicity of construction. This means increased efficiency and remarkable power.

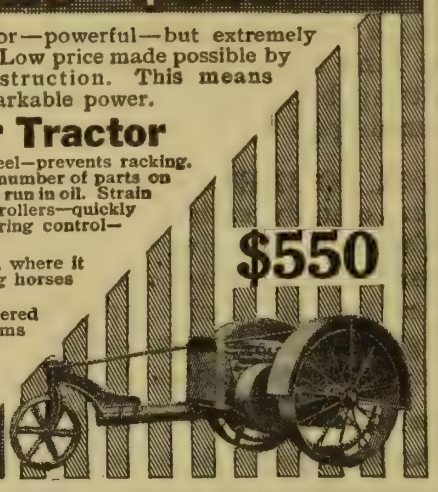
Happy Farmer Tractor

Light in weight—durable—frame all steel—prevents racking. Holds all parts rigidly in place. ⅔ usual number of parts on tractors of equal strength. Enclosed gears run in oil. Strain borne by wooden clutch shoes, pins and rollers—quickly and economically replaced. Special steering control—runs clear across field without attention.

88% total weight falls on traction wheels, where it belongs. Takes less fuel. Pulls anything horses can draw. Write for full specifications.

Dealers: Quickest selling tractor ever offered you. 1916 supply limited—write today for terms and territory—distributor or us.

Happy Farmer Tractor Co.
330 Third Ave. North, Minneapolis, Minn.



New 1916 Plow Offer—The High-Grade Monmouth Extra Hard Steel Walking Plow

30 Days' Free Trial
Sold Direct From Factory
We SAVE You Money

$8.10! A *big* reduction in price, due to our great increase in production—and our method of selling *Direct from Factory to Farmer.* A better Walking Plow has never been made! Look at the high-class construction! Share and moldboard the *Very Best Soft Center Steel, Finely Tempered and Polished.* Heavy steel frog, to insure ample strength and lasting durability. Heavily braced at every point of strain, to *guarantee* steady, *true* running. Beam made of High Carbon Steel. Toughest Oak Handles, nicely finished grips. The plow with "just the right hang." *And* sold direct for $8.10—with a

CORN AND OATS

WHEAT, TIMOTHY, CLOVER and other crops yield more where a perfect seed bed is prepared. The Western has no equal for this work. Pulverizes, packs and mulches at one operation. Saves time, seed, horsepower. Especially valuable for covering clover and grass seed, and rolling young grain and corn in spring. Will form hardest crust into moisture-holding granular mulch without hurting grain.

Western Pulverizer, Packer and Mulcher

Three Machines in 1

Made in 8 sizes, 1 and 3 sections. Sold direct, price $20 and up. We want every farmer to have our free catalog before buying a roller or packer. It will prove we can save you money and have far the best machine. Contains full description and price direct to you, letters from many farmers proving its advantages over other makes, and much other valuable information. Send for it today.

WESTERN LAND ROLLER CO., Hastings, Nebr. Box 454

CURRENT EVENTS

PRESIDENT WILSON spent practically all of the past week traveling through the grain belt, speaking on preparedness to immense crowds. Upon his return to Washington he expressed himself as more than satisfied with his trip, asserting his conviction that the people of the middle West are with him and that there is none of the lethargy which had been reported to him. The president delivered notable speeches at Milwaukee, Chicago, Des Moines, Topeka, Kansas City and St. Louis. At the very outset he announced that no crisis was imminent, that nothing had developed recently which should alarm the country, but that affairs were progressing so that the nation needs and should demand better preparedness against possible danger. In his speech at St. Louis he asserted that the United States should have "incomparably the greatest navy in the world." The president spoke to at least 100,000 people, it is estimated, at the larger stopping places, while 50,000 more heard him as they gathered around the rear platform of the car in which he traveled. In addition, hardly fewer than half a million others have been banked on the sidewalks to watch and cheer him. Altogether the president is so well satisfied he is planning another trip for the near future which shall take him through the South and West as far, possibly, as Denver. The tone of his speeches is well shown by this extract from his Kansas City address: "There may come a time—I pray God it may never come, but it may come in spite of everything we can do—when I shall have to ask: 'I have had my say; who stands back of it? Where is that force by which the right and majesty of the United States are to be vindicated and asserted?'" The president declared the need was immediate and that action should be begun within the present month. "I assure you there is not a day to be lost!" he exclaimed. "Not because there is any special crisis, but because I do not know twenty-four hours ahead what will happen.

A DEFINITE policy contemplating Philippine independence in four years has been approved by the United States Senate, Vice President Marshall casting the deciding vote. President Wilson has not made any public declaration on the subject, but it is understood he will not stand in the way of the movement, especially since the last democratic national platform declares squarely for it. The amendment adopted by congress provides as follows: "The president is hereby authorized and directed to withdraw and surrender all right of possession, supervision, jurisdiction, control or sovereignty now extending and exercised by the United States over the territory and people of the Philippines, and he shall on behalf of the United States fully recognize the independence of the said Philippines as a separate and self-governing nation and acknowledge the authority and control over the same of the government instituted by the people thereof. This transfer of possession, sovereignty and governmental control shall be completed and become absolute not less than two years nor more than four years from the date of the approval of this act." It is provided that if the president finds the condition of Philippine affairs to be such that independence is not practical, in four years, he may withhold granting it until congress shall have reconvened again, in order that further action may be taken.

A SUGGESTION that all the belligerent nations in the present great war subscribe to a declaration of principles governing attacks on merchant vessels and forbidding the arming of such vessels has been made by the United States, in an effort to establish in international law a general policy disposing of many of the vexatious problems arising from the development of submarine warfare. Identical notes have been sent out asking the various countries at war to say specifically whether they are willing to join in such an agreement. The declaration of principles would provide that non-combatants may expect protection under the rules of international law and principles of humanity when traveling on merchant ships; that warning must be given before a merchantman is attacked; that belligerent owned merchant ships must obey warnings to stop; that merchantmen shall not be fired on except in case or resistance or flight; that no merchantman shall be sunk except where it is impossible to supply a prize crew or until passengers and crew are placed in safety; that merchantmen shall not be permitted to mount arms. Germany and Austria already have agreed in effect to the proposals regarding attacks on commercial ships, and Great Britain and her allies always have been understood to be in accord with the American viewpoint on that subject.

TWENTY-FOUR persons were killed and twenty-seven injured in a Zeppelin airship raid on Paris last week, the first time the big dirigible balloons of the Germans have visited the French capital for some months. Notwithstanding the advance warning that the Zeppelins were coming and the fact that thirty French aeroplanes sought to drive the aerial visitor away, the Zeppelin was successful and dropped about three and one-half tons of bombs on the helpless city below. The airship flew at terrific speed between two and three miles up in the air and dropped the bombs at random, as a dense fog enveloped the city. In a populous part of the city a bomb struck a six-story apartment building occupied by the families of workingmen, cutting it in two on the line of the corner of the kitchens, from garret to cellar, burying ten victims under the debris of the central part of the structure. The street front was untouched, and on the other side of the gap the six kitchens of the building, one atop the other, were left open to the weather with the ranges and utensils in plain view and apparently undisturbed.

THE historic Canadian parliament building was destroyed last week by a fire which the Canadian officials believe was started by the explosion of a bomb or infernal machine. Several lives were lost, while the building, which was valued at $5,000,000, was almost entirely destroyed, without insurance. Canada's participation in the war is believed to have brought about the act which fired the building, with the attendant loss of life. The cornerstone of the historic structure was laid in 1867 by King Edward VII, then Prince of Wales. Canada has rallied to the support of the mother country in surprisingly enthusiastic fashion and has sent many thousands of soldiers over to the trenches and battlefields of Europe.

THE generally increased price of gasoline, Secretary Lane reported to the United States senate in response to a resolution, is caused by shortage of supply and an increase in consumption. He recommended that the situation be relieved by the use of heavier distillates in internal combustion engines. Secretary Lane's report asserts that "authorities agree that the automobile and other internal combustion engines are primarily responsible for the increased consumption of gasoline," and adds that a kerosene carburetor "would at once go a long way toward relieving the present shortage." The report says the increase in consumption of gasoline in the United States in 1915 was 25 per cent over 1914 and estimated that there will a corresponding increase in 1916. The production in 1915 increased 20 per cent over 1914. War exports are heavy.

Buttermakers' Convention.

Practical Hints of Benefit to Farmer-Dairymen Were Brought out at the Convention Held Last Week at Eau Claire.

THE growing importance of the buttermaking industry in Wisconsin was exemplified last week by the Wisconsin Buttermakers' Association holding at Eau Claire the largest and most successful convention in its history. The butter exhibit was the largest ever gotten together at a state meeting and the fact that this butter brought twenty-seven cents when put up for sale indicates that the quality, taken as a whole, was exceedingly good.

This was the fifteenth meeting of the association and something more than 400 buttermakers and others interested in this industry were present. The new license law was one of the big subjects before the convention.

The past year, from the creamery operator's standpoint, has not been so good as it might have been, but stocks are moving rapidly now, prices are good and the greatest optimism prevails for a very prosperous year.

Much interest was shown in the exhibit of butter. There were 185 tubs shown and the winning tubs, the judges declared, were as fine in quality as could be hoped for. H. H. Whiting, of the Ayrshire creamery at Johnson Creek, took off first honors with a score of 97. Mr. Whiting won first last year and the fact that he is able to win in such competition is a strong argument for study and thought by the buttermakers, as Mr. Whiting has for years scored his butter at the dairy school, attended state exhibitions and sought to learn the necessary essentials in successful buttermaking.

B. L. Bolstead, of Basco, took second place, his butter scoring the same as Mr. Whiting's exhibit on flavor, but there was just enough cut in body to deprive him of first honors. Mr. Bolstead had made the mistake of overworking his butter. Both of the winning tubs showed that the cream from which they were produced was of the highest quality and that such butter could only be procured with the assistance of the farmer, who must do his part by taking to the buttermaker clean, sweet cream, high in test in butter fat. The buttermaker working with thin cream is under a disadvantage and it pays the farmer at this season to deliver cream testing around 35 per cent fat as well as the buttermaker to demand high-testing cream. Cream testing up to 40 per cent is better in the summer months. Too many farmers are delivering thin cream, cream testing 20 per cent and under, and when so doing they are going to an unnecessary transportation expense and depriving the farm of much skim milk high in feeding value.

The entire exhibit of butter so far as texture goes was very fine, but the low-scoring tubs were so scored because of a poor flavor which might have been caused by a combination of causes. No doubt feeding conditions were the cause for some poor flavored exhibits, as the silage being fed this winter is not up to the usual standard and contains some weeds which the farmers could not get out of their corn because of the wet season. Mr. C. E. Lee, who, with William Schneider, of Johnson Creek, and O. A. Storvick, of Albert Lea, Minn., scored the butter, told the writer that much of this rank flavor came from the fact that the cream was not collected fast enough—that it was permitted to remain on the farms too long. Better care of the cream, he felt sure, would have meant a higher score for many tubs, and this drives home the relation of the farmer with the buttermaker if the farmer's creamery is to produce high-quality butter and in turn be able to pay top prices for the cream. The exhibit butter went to the Hunter-Walton Co., of Chicago, at twenty-seven cents.

The convention teemed with good things and everything of interest to the buttermaker, from his relations with the farmer to refrigeration and pasteurization, were discussed. One afternoon was devoted to a discussion of the new license law, which discussion was led by Mr. Lee and Commissioner Wiegle, of the dairy and food commission, and the interest shown by the delegates indicates a hearty co-operation with the commission in improving dairying conditions. "If we could have had such a meeting and such co-operative effort in Wisconsin ten years ago this state would be far ahead of its position today," said Mr. Lee after the meeting. Mr. Lee also pointed out why the farmer should be interested. It means more profit to him when his buttermaker turns out a product that tops the market, and this product can only be produced on the farm under sanitary conditions.

D. F. Wallace, of Alma Center, gave some very interesting pointers on getting the farmers to whitewash their barns. Mr. Wallace told of the experience he had at Alma Center which finally resulted in getting sixteen farmers to use whitewash, and finally most of them fell in line, although at first they thought it a useless expense.

Whitewash, in addition to making a barn light and clean looking, is a disinfectant and Mr. Wallace said many could be induced to whitewash for disinfecting purposes when not "just to spruce up." This work among the creamery patrons he considered a duty of the buttermaker and he advocates that every creamery buy a whitewashing machine, which costs about $15 to $20, and rent it to the farmers at the small cost of probably 50 cents per barn. The whitewashing done in his vicinity, he said, was done by a private contractor at a cost of from $2 to $9 per barn, depending on the size, and certainly no farmer can continue to have a dirty, dark barn when it can be done this cheaply. Lime is not only the best disinfectant, but the cheapest, and there is no danger from the cattle eating it.

H. H. Whiting, the prize buttermaker, gave some splendid pointers which should be of value to his co-workers, and Clarence A. Day, of Madison, advised how to care for the creamery churn. John J. Farrell, dairy and food commissioner of Minnesota, spoke at length on conditions in his state as well as Wisconsin and urged that buttermakers never ship any butter known to be of inferior grade. To do so scares the market. Proper management is vital, he said, and urged great care in selecting creamery managers. Sometimes it is better to make the buttermaker the manager, he explained.

E. J. Morrison, of Chetek, was chosen president to succeed Allan Carswell, of Clear Lake; Carl Jorgenson, of Rose Lawn, was elected vice-president; G. H. Benkendorf, of Madison, was re-elected secretary, and F. M. Werner, of Waterloo, re-elected treasurer. The treasurer's report showed the association in a flourishing condition, with a balance of more than $2,200 in the treasury. O. B. Cornish, of Fort Atkinson, was again chosen a member of the executive committee with these members: C. J. Dodge, of

(Concluded on page 13.)

MEDUSA PRODUCTS *Make Good* CONCRETE

WHAT are you planning to build this spring? Are you ready to make those long needed improvements—the new feeding floor, the new hen house, the cistern that needs repairing, the new milk cellar, the new steps for the house—or even a new silo? Now is the time to see them through to a *finish*.

That means that you will want to make them of concrete—and of the best concrete—because a good concrete job stays *good*. The things you build this spring with good concrete won't have to be rebuilt next year—or any other time.

Only remember this—be sure of your sand, of your gravel or stone, and, above all, of your *cement*.

Be sure to use one or more of the Medusa Cement products in your concrete. You can rely on them all for best results—Medusa Gray, Medusa White and Medusa Waterproofed Cement, both colors.

MAKE YOUR CONCRETE WATER-TIGHT

But you want something more than just permanence in all your concrete work. You want it *water-tight*—and the best and cheapest way to do this is to have 2 per cent. of Medusa Waterproofing mixed with your cement.

A comparatively lean mixture of cement, sand and gravel or stone is *abundantly strong* for most farm construction. The addition of Medusa Waterproofing will make such mixtures water-tight as well as strong—without affecting the strength, setting or hardening qualities of the concrete. Get our Waterproofing booklet—it will save you money.

Make your concrete beautiful with

MEDUSA WHITE PORTLAND CEMENT

The first true white Portland Cement ever manufactured. A facing of Medusa White Portland Cement adds 100% to the appearance of buildings of all sorts. It is just as strong and just as desirable as any other high testing Portland. The only difference is that, instead of the ordinary unattractive greenish gray, it is naturally a pure, stainless white, and can be tinted to produce wonderful color effects.

Note—We also make and recommend Medusa Waterproofed Portland Cement (gray) and Medusa Waterproofed White Portland Cement — containing Medusa Waterproofing ground up with the cement at the factory in just the right proportions for perfect results. Ask your dealer.

Types of Movable Hog Houses.

An Investment in These Structures Enables Breeders to House Swine at Small Cost.

AN EXCEEDINGLY interesting and instructive bulletin was published last year by the swine division of the Iowa Experiment Station. The problem of movable hog houses was taken up in detail and the text of the bulletin well illustrated by drawings and engravings. We have chosen four of these houses and these are shown in the accompanying illustrations. They have been tested out at the Iowa station and it has been ascertained that they are practical in every way and it goes without saying that they are inexpensive. Where there is no central building for the housing of swine the movable house system can be used to great advantage. It ties up a comparatively small amount of capital and the fact that these houses can be moved from place to place is a point of merit that is strongly in their favor irrespective of their low cost.

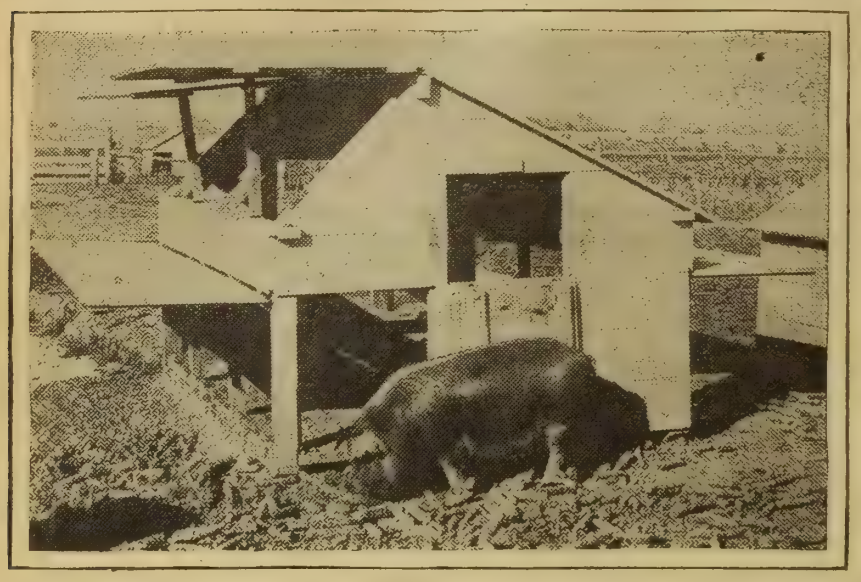

FIG. 1.

The house shown in Fig. 1 is built with doors in the roof so as to provide a maximum of direct sunlight. This house is six feet wide and eight feet long. It is placed on runners, 4x4, so that its location can be changed easily. The cost of the material in this house runs between $17 and $18, this price including a double coat of paint.

A somewhat different type of house is shown in Fig. 2. It is simple of construction and presents an attractive appearance. The perpendicular walls, as in the case of the house shown in Fig. 1, enable the floor space to be utilized to good advantage.

A somewhat similar type of house is shown in Fig. 3, but in this case there is roof lighting, over which folding doors are placed for purposes of warmth when they are needed. Special precaution must be taken in the erection of this house so that the glass in the roof is not broken. It will have to be protected by stiff wire, properly re-enforced, so that it cannot be pushed against the glass. This type of house is the same size at its base as the house shown in Fig. 1, being six feet wide and eight feet long. It is necessary to place a fender inside around the four walls so that young pigs cannot be crushed against the wall. A stout 2x4 will answer the purpose well, but gas piping is still better. If the pipe is embedded in the frame it cannot be displaced and it is not subject to being gnawed by ill-tempered old sows.

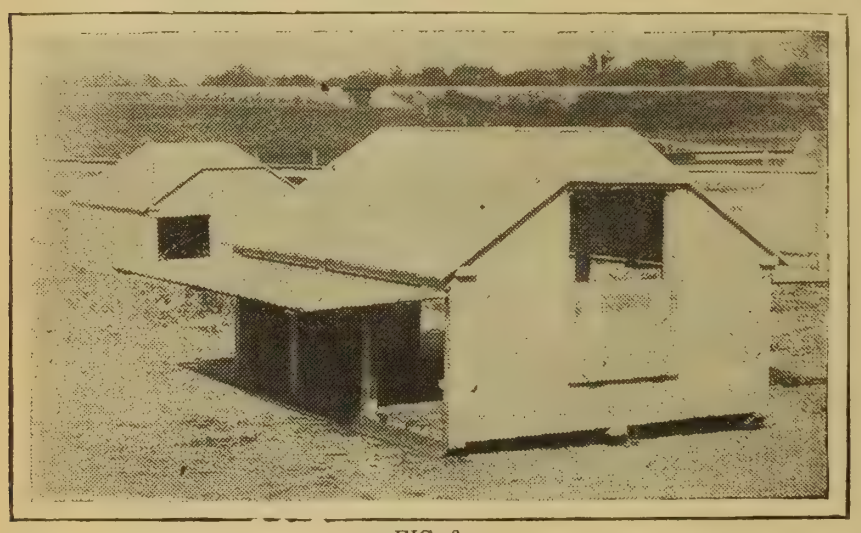

FIG. 2.

Then there is the "A" type of house shown in Fig. 4. This is proving to be quite satisfactory and it is strongly recommended by a large number of practical swine breeders. No interior fenders are needed in this house, as the slant of the roof affords ample protection to little pigs, although they are needed across the end. This house is usually built six feet wide by eight feet long, with the ridge a little over six feet from the floor. Attention is called to the fact that if it is made lower than six feet it will be necessary to use a swinging door hinged at the top because the lower house will not permit the sliding door to be raised high enough. A window should be placed in the end opposite where the door is located.

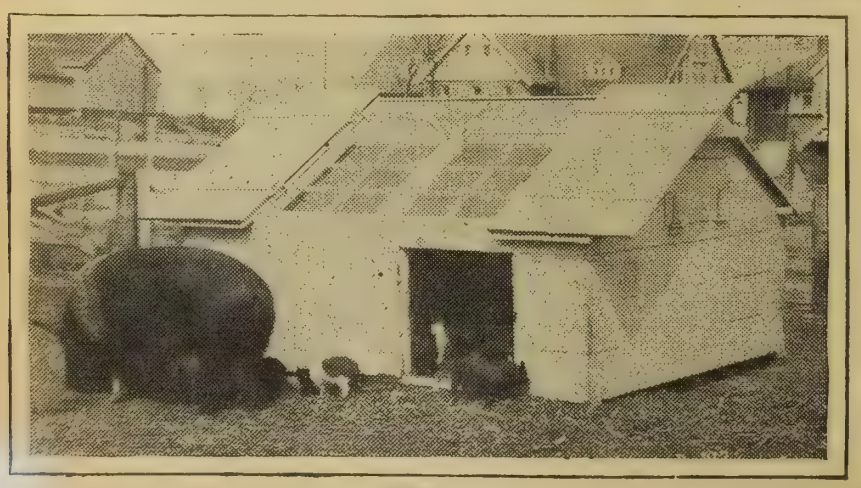

FIG. 3.

FIG. 4.

Nearly 150,000 volunteer crop reporters and special correspondents are now aiding the bureau of crop estimates of the United States Department of Agriculture in the preparation of its estimates of crops and live stock production of the country, according to the annual report of the bureau which has just been issued. In addition there are 151 paid employes in the service of the bureau. The total appropriation for the work for the fiscal year ending June 30, 1915, was $275,580. The bureau has enlarged its work during the fiscal year by assigning one of its employes to the work of investigating truck crops. The crops for which acreage estimates were undertaken by this specialist include watermelons, cantaloupes, cabbages, onions, early potatoes, tomatoes and strawberries. Other crops are to be added as the work progresses.

Dollars in Ditches for You

Every undrained farm in your county means possible profit for you. You can make $10 to $15 a day without more effort than ordinary farm work requires.

You can cut tile ditches at an average cost of 5c to 7c a rod, including liberal wages for yourself. Your neighbor will pay more than this, giving you a big profit. The

"A Perfect Trench at One Cut"

BUCKEYE Traction Ditcher

Works perfectly and economically in any soil, leaving the trench ready for the tile. The trench will be absolutely to grade with smooth, true, vertical sides and the finely pulverized excavated dirt deposited to one side convenient for backfilling. Hundreds of these machines are in actual operation today, all giving satisfaction. You, too, can make big money easily with the Buckeye.

Read What These Men Have Done in Their Own Counties

Macksburg, Iowa.
Am enclosing photo of machine at work digging 3-ft. deep at the rate of 16 rods per hour. We average about 100 rods a day, 3-ft. deep, for which we receive 25c per rod, at the expense of about $5.00 per day, or 5c per rod, which would leave us $20.00, which is pretty good interest on amount invested.
DAVIS & MACUMBER.

Riga, Mich.
I am sending you a record my ditcher made in 115 days. My total expenses—gas, repairs and labor were $436.35 with my time figured nothing. I dug 13,312 rods of ditch and the work came to $2,945.26 so that left me for my work $2,508.91 and my machine was just as good when I got it through as when I got it.
JOHN GOLL, Jr.

Write for Special FREE Book of Facts

It tells all about the Buckeye Traction Ditcher and contains letters from men who have made money with this machine. Describe your soil conditions and size ditches you wish to cut. We will gladly outline the machine and equipment best adapted and most profitable. Our Service Department will help you build up a steady paying, healthful contract tile drainage business. This advice and assistance free. Write us today.

DON'T FORGET

There's a big difference in cupolas; difference in price, in material and in construction. The Queen was the original. On the market over 15 years. Good from the start. Still ahead. Used by thousands. Made of steel reinforced with heavy braces. Bird proof, snow proof, leak proof. Write for catalog and prices or ask your lumber dealer. QUEEN CUPOLA CO., 315 PECK ST. CRESCO, IOWA.

QUEEN CUPOLAS

HOLSTEIN BREEDERS ELECT.

The Waukesha County Holstein Breeders' Association is now an incorporated organization. A board of nine directors has been elected as follows: For one year, Arthur J. Rust, West Allis; Stuart Reid, Oconomowoc; Chas. Cole, Dousman; David Roberts, Waukesha; Robert L. Baird, Waukesha; H. E. Reddelien, Oconomowoc; for three years: Dr. M. W. Downing, Waukesha; Chas. J. Will, Menomonee Falls; W. L. Baird, Waukesha.

The directors elected C. J. Will president; H. E. Reddelien, vice president; Chas. Cole, treasurer, and W. L. Baird, secretary. C. H. Jacob was elected auditor of the association for the ensuing year.

The matter of securing a county representative for Waukesha county was left in the hands of the directors.

The following resolution presented by S. A. Baird was unanimously endorsed: "Be it resolved, that the Waukesha County Holstein-Friesian Association go on record as favoring, and do petition the bureau of animal industry or like department of state live stock industry, to establish a record bureau of all the tuberculin tested herds of cattle in Wisconsin."

ON BARN VENTILATION.

To the Editor:—Our horse barn is something like 132 feet long and can take care of thirty head of horses and several cows comfortably, but we usually have had about twenty head of horses and two cows housed in it. When built seven or eight years since, we recognized that some sort of ventilation would be necessary and hence had foul air flues built based on our own idea of what would conduce to proper ventilation, these flues running up through the hay mow to wooden cupolas on the roof. This ventilation did not work satisfactorily and the barn was very foul smelling and there was much dampness and mold. Our attention was called to the King system and we recently had their system installed with three aerators on the roof and six foul air flues running up to them and with fresh air intakes, all put in in accordance with plans worked out by a ventilation specialist. Although we have had this system in but a few months now, the improvement is very marked. The foul air is being taken out and replaced with fresh air continually; there is a very noticeable doing away with the disagreeable odor, and there is none of the dampness and mold now such as was so pronounced previously. We have had no tests made to show just how often the air is being changed, but there is a large volume of foul air moving up the foul air flues and a like volume of fresh air coming in the fresh air intake to replace it. The fresh air intakes are so arranged that the quantity of air flowing through them may be cut down or completely cut off by means of an adjustable door operated from the inside of the barn. We presume in extremely cold weather these doors would need to be adjusted to meet the conditions in case it should throw too much cold air into the barn.

The one thing that strikes us about barn ventilation is this, that while ventilation is seemingly a simple proposition, if farmers or others than experts should attempt to install a system of their own to take care of this important phase of barn building, the chances are ninety-nine to one that they would not get their system right and it would not perform the work properly. With the King system planned as it was for us one is absolutely sure of perfect results or as nearly perfect as it may be possible to devise ventilation for tight barns where a varying number of cattle, horses, etc., may be housed from night to night. There are a number of cow barns within a radius of one or two miles of this city which have installed the King system this past summer and two of these barns are occupied with stock at the present time—the other not yet having been occupied.

A. H. Krouskop.

Richland Co., Wisconsin.

POLK COUNTY GUERNSEY BREEDERS HAVE WINTER MEETING.

To the Editor:—On January 15th, in the high school building at Amery, Wisconsin, was held one of the most enthusiastic meetings the Polk county association has ever held. In spite of the severe weather there was a good attendance. Beginning at 10:30 the general business and election of officers occupied the balance of the forenoon. The newly elected officers were: J. H. Stewart, president, Clear Lake; J. P. Tanner, vice president, Clear Lake; E. T. Stewart, secretary, Clear Lake; W. H. Scott, treasurer, Clear Lake; directors, S. B. Vassau, Amery; J. S. Klinka, Balsam Lake; J. P. Jensen, Amery; Andrew Eastlund, Dresser Junction, and O. T. Jensen, Milltown.

The addresses of the day were upon valuable topics and ably delivered by J. S. Klinka, of Balsam Lake, and R. P. Cuff, of Barron. Several musical numbers which were greatly appreciated were other features of the afternoon program. That Polk county is getting rightly started in Guernseys is a certainty. There are very many good sires in use, both from a breeding and individual standpoint, sires whose daughters are evidence of their breeding ability. In the past few years several Guernsey breeders have come to the county with their herds, which has extended the business very favorably. The association will undoubtedly offer for sale a carload or more of choice grades in the near future. Preparation was made for the summer meeting and on invitation of O. T. Jensen the club unanimously voted to meet at his farm at Milltown on June 15th.

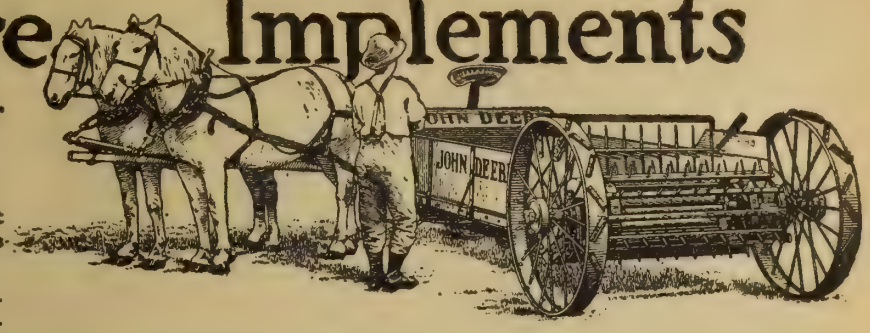
E. T. Stewart, Sec.

LIVE STOCK STUDENTS PLAN TRIP IN FEBRUARY.

A class of 125 students enrolled in the second year of the short course at the college of agriculture, University of Wisconsin, will take an observation trip to the Union Stockyards, Chicago, February 21st, returning by way of Waukesha, where tney will visit a number of the dairy farms in that well-known "butter-fat belt." The class will be led by George C. Humphrey, in charge of the department of animal husbandry.

The fact that duty should come before pleasure doesn't mean that it is to take the place of pleasure. You need recreation as much as you need food. Take it regularly, and in the open air.

John Deere Implements



John Deere Spreader
The Spreader with the Beater on the Axle

ONLY hip high to the top, but has big drive wheels. Wheels out of the way when loading.

Beater drive works on the principle of a horse power. No clutches, no chains, no trouble. Mounting the beater on the axle (a patented feature) does away with half the types of castings.

Three exclusive features of the John Deere Spreader: [1] Beater on the axle—simply revolutionary in spreader building. Nothing else like it. Doubles the value of the spreader by all practical tests. Makes the John Deere Spreader possible. [1]

[2] Revolving Rake—entirely new and original. Load moving back to beater revolves the rake. The teeth down in the load hold the manure while the beater pulverizes it. Draft actually less. Even spread—no bunching. [2

[3] Ball Bearing Eccentric—apron driven without friction. This ball bearing apron drive requires no attention, not even oiling, but it performs wonders in the working of the Spreader. [3]

Write for John Deere Spreader booklet. Tells all about farm manures and fertilizers, how to store manure, its value, and how to spread it most economically. Also contains illustration in colors.

John Deere Plows for Light Tractors
High and Level Lift

PRACTICAL—the right size for the average farm. Work with any standard tractor. Controlled by the man on the tractor.

Pull the rope and all bottoms raise high and level. Another pull lets them down. Plows do not clog or gather trash on the turn.

Extra beam and bottom, readily attached, increases regular two bottom plow to three, or regular three bottom to four, as desired.

Equipped with Quick Detachable Shares—save 80% time changing shares. Write for free booklet.

John Deere Syracuse Plows
The Plows with Perfect Fitting Parts

SYRACUSE chilled shares fit perfectly—the extra shares go on easily. A smooth joint is formed between share and moldboard and share draws up snugly to its place. Two bolts in share instead of one. Rib on back of share strengthens share and standard.

Write for free literature on the 442 series, combination plows, for use in sandy or gravelly soils, and work well in turf or stubble. Also the 61 series of combination plows, for use in sandy-loam soils, fairly free from stones and grit, or in sticky soils where good cleaning qualities are desired.

Van Brunt Drills and Seeders
With Adjustable Gate Force Feed

VAN Brunt Drills plant any small seed, alfalfa to bearded oats, peas or beans.

Amount sown per acre easily regulated merely by shifting feed gauge levers.

All the ground sown, because the Van Brunt adjustable gate force feed compels seed to leave hopper in even, continuous streams—no bunching or choking up—and an equal amount goes into each furrow.

An even stand of grain is secured, because pressure springs compel all the discs to cut furrows of equal depth, and the forward closed delivery places seed at bottom of these furrows.

Van Brunt Drills never clog up. Scrapers keep discs absolutely clean. The high grade discs have bearings that are guaranteed to last lifetime of drill.

Smooth running—each wheel drives half the feeds, equally distributing the work. A direct, double gear drive from the continuous axle.

Grass seeder attachment can be furnished which will drill or sow broadcast as desired.

Van Brunt Broadcast Seeders are just as positive in their operation as Van Brunt Drills.

Write us for free booklets describing Van Brunt Single or Double Disc Drills, or Broadcast Seeders.

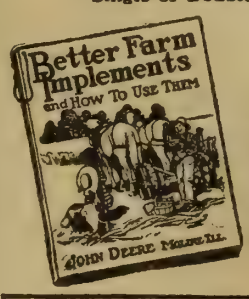
R. & V. Engines
Dependable Farm Power

"R & V" Triumph—always develops rated horse power—made in 1, 1½, 2½, 4, 6, 8, 10, 12, 16 and 20 H.P. sizes, stationary and portable.

Easily started; perfect speed control (speed can be varied 40 per cent without stopping engine). Complies with insurance regulations. Hopper cooled—a simple, efficient system that does not require long pipes and numerous fittings.

High grade throughout. Inspect the extra guard ring over piston pin to prevent possibility of scoring cylinder. Ask about the "R & V" oscillating magneto. Write for free booklet.

John Deere Dealers Everywhere



Better Farm Implements and How to Use Them

BOOK FREE—168 page reference book—tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars. Describes and illustrates: Plows for Light Tractors; Steel and Chilled Walking and Riding Plows; Disc Plows; Cultivators; Spring Tooth and Spike Tooth Harrows; Lister Plows and Cultivators; Disc Harrows; Alfalfa and Beet Tools; Farm and Mountain Wagons; Teaming Gears; Manure Spreaders; Inside Cup and Portable Grain Elevators; Corn Shellers; Hay Loaders, Stackers, Sweep Rakes, Mowers, Self-Dump Sulky and Side Delivery Rakes; Hay Presses; Kaffir Headers; Grain Drills and Seeders; Grain Binders; Corn Binders; Gasoline Engines. This book sent free to every one who states what special implements he is interested in and asks for Package No. X-64.

John Deere, Moline, Illinois

ARRANGEMENTS FOR SWINE WEEK.

Officers of several of the state breed associations met recently at Madison and decided to have a swine week at Madison some time in 1917, probably in February. After discussing the feasibility of holding a series of conferences and demonstrations at this season of the year for the purpose of advancing the five different classes of live stock the breed representatives decided to leave the arrangements for a swine week to a committee which would represent the several breeds, the college of agriculture and this association. The committee appointed consists of E. H. Parker, to represent the Wisconsin Duroc Jersey Breeders' Association; H. C. Taylor, the Wisconsin Berkshire Breeders' Association; James Fisher, the Wisconsin Chester White Breeders' Association; Mace Madson, the Wisconsin Poland China Breeders' Association; G. C. Humphrey, the animal husbandry department of the college of agriculture, and myself the Wisconsin Live Stock Breeders' Association.

The suggestion that similar committees be later constituted for the advancement of the beef cattle, sheep, dairy cattle and horse interests met with unanimous approval and such representations will likely soon be chosen.

The swine week committee met immediately after the general session and agreed that the conference in 1917 should consist of a demonstration sale of high-class breeding animals and also an experimental demonstration which would be of value to every farmer in the state interested in economic pork production. It was thought that it would be best to have the various breeds of swine alternate in the holding of these annual association sales. And because of the fact that the movement was originated by Messrs. John D. Gant, E. H. Parker, L. F. Atwater and M. H. O'Keefe, of the Wisconsin Duroc Jersey Breeders' Association, it was decided that the Duroc breed should be given the opportunity of making the first sale. It was later suggested that it would be best to have the two breeds having the largest number of herds in the state contribute to the success of the first sale. This was done to encourage still greater interest upon the part of the farmers of the state in the event.

Later announcements will be made of the plans for the week. Among those who attended the conference were:

Arthur Broughton, president Wisconsin Sheep Breeders' Association and vice president Wisconsin Live Stock Breeders' Association, who acted as chairman; H. C. Taylor, president Wisconsin Berkshire Breeders' Association; M. H. O'Keefe, John D. Gant and E. H. Parker, Wisconsin Duroc Jersey Breeders' Association; L. C. Underwood, Wisconsin Red Polled Cattle Club; W. M. Connell, Wisconsin Aberdeen Angus Breeders' Association; M. Madson, Wisconsin Poland China Breeders' Association; Eben E. Jones, Wisconsin Shorthorn Breeders' Association; C. W. Thompson, Wisconsin Hereford Breeders' Association; W. K. Caldwell and James G. Fuller, of the Wisconsin Horse Breeders' Association; Jerry P. Riordan, Wisconsin Holstein Breeders' Association; A. J. McNab, Wisconsin Ayrshire Breeders' Association; George C. Humphrey and H. L. Russell, Wisconsin College of Agriculture; Raymond Baker and Andrew Hopkins, Wisconsin Live Stock Breeders' Association.

RURAL ELECTRIC LIGHTING.

(Continued from page 6.)

tor is a part of the armature and is made up of copper segments insulated from one another by strips of mica. This part is subject to the wear of the brushes. The brushes, usually made of carbon, convey the current from the commutator to the distributing point. The contact of the brushes will in time cause the commutator to become uneven. To remedy a slight unevenness of the surface wrap a piece of fine sand paper (not emery cloth) on a flat surface of a wooden block, about the width of the commutator, and apply with pressure on its surface while dynamo is in motion until it is bright and even. If this is not effective it will be necessary to send the armature to an electrical repair shop or a machine shop where the commutator can be cut to smoothness. When the dynamo is not in use keep it covered to prevent the settling of dust on the parts of the machine. Keep the armature bearings well oiled with high-grade dynamo oil.

I conducted a test on a plant operated by a two-horse-power kerosene engine last winter. The working load of the engine was about one horse power for one hour's time, which is the equivalent of eight sixteen-candle-power tungsten lights burning five hours. Using gasoline for fuel the cost would somewhat exceed this figure. Under the ordinary operating conditions the expense for fuel and lubricating oil, when the engine is worked to its capacity, will not exceed 4½ cents per horse power hour of run.

The installation of a lighting plant where storage battery is used should not be attempted by the inexperienced man. A plant not properly installed is likely to be a bill of expense to its owner.

Two factors enter largely into the success of rural lighting by electricity—the battery used and the care of the plant. The experience of the owners indicates that of these two factors the care given the plant is the more important, some securing excellent results and others having very little success with the same type of plant. This difference is explained by the care, or rather lack of care, which the plant receives.

A Great Tomato Bearer.

THE Mills Seed House, Rose Hill, N. Y., say that from 100 to 150 pounds of tomatoes have been grown on a single plant of their Giant Climbing variety, a sample package of which they offer to send on trial to anyone writing for their splendid 1916 seed book, offered free in their advertisement on page 19. The book fully describes their extra fine vegetable, fruit and flower seeds. Address Mills Seed House, Dept. 25, Rose Hill, N. Y., and please mention this paper.—Adv.

Velie Six

THIS is the Biltwel Model 22—the car that astonished the motoring public when we announced that it would be a regular, full-size, fully equipped Velie to sell for only $1065. Let us mail you a catalog showing Model 22, also Model 15, which has been reduced nearly $200 on both the five and six passenger types. You're not far from the Velie factory—pay us a visit—and, in the meantime, get that catalog.

VELIE FEATURES

115-inch wheel base—standard tread
Velie Continental motor 40 h. p.
Removable cylinder head for inspection
Helical gears in motor—no chains
Multiple dry disc clutch
Automatic ignition system
Hotchkiss type of drive
No noisy strut rods or torque arm
Spiral gears in rear axle
48-inch underslung rear springs
Velie-Stewart vacuum feed
All electric wiring in metal conduits
Push button starting device
Two-unit Remy electric system
Expanding tire iron—no straps
Velie mirror finish 20 operations deep
Fine leather deep tufted upholstery
Double-bulb headlights—rigid supports
Curved radiator blending with hood and body
Windshield ventilating top and bottom
15-gallon gasoline tank with gauge at rear
Simple rocking gear shift lever
Quick adjustable side curtains
Heavy steel-crowned fenders
Cowl light shows if tail light is going

EQUIPMENT

One-man top, speedometer, dash light, portable light, coat rail, foot rail, electric horn under hood, 32x4 in. tires front and rear (non-skids on rear) 5 single-piece demountable rims and full tool equipment, tool kit, etc.

$1065

Model 22

VELIE MOTOR VEHICLE CO., 118 Velie Place, Moline, Ill.

SEEDS

"Purity Brands" have always been the highest qualities obtainable each year. Hundreds of farmers will not experiment with any other. All seeds sold on absolute guarantee of **purity** and **germination**—being subject to your test and inspection and money refunded if not better than we represent. **Timothy, Clovers, Alfalfa, Mixed Timothy and Alsike, Blue Grass, Millets, Seed Corn, Seed Oats, Seed Flax, Seed Grains,** etc. Samples and prices free on request.

THE ADAMS SEED COMPANY BOX 50 DECORAH, IOWA

PRICES DOWN AGAIN!

GALLOWAY SANITARY CREAM SEPARATORS

are lower priced than ever and the quality has been maintained throughout. In spite of the increased cost of all materials, on account of the large volume going through my factories, I am able to again cut and slash cream separator prices. The 1915 prices are not in force any more. My new low 1916 prices and new easy selling plans, such as no money down—a year to pay, etc., have taken their place. 10,000 separators now coming through my factories—all to be sold on **special proposition between now and grass.**

~~42.50~~ ~~51.00~~ ~~63.50~~

In addition to the famous line of separators I have been building I have added a new size which I am selling for less money than ever before. It is identical in quality and design with the other sizes, and fully described in my

1916 BOOK—NOW READY!

250 PAGES—If you buy a separator in the next twelve months you should have this book. It tells how I build the Galloway Sanitary Bath-in-Oil Cream Separators from the ground up. Read this book before you buy a cream separator of any make at any price!

Don't be misled on cream separators thrown together and sold for a price. Buy direct from a real factory, get a better machine and save from $25 to $50 on a machine of the highest quality. Shipped from Waterloo, Kansas City, Council Bluffs, St. Paul or Chicago—the nearest point.

4 sizes skimming 875 to 950 lbs. per hr.

4 new low 1916 prices.

NOTE THIS BUILT IN QUALITY

Heavy, high carbon steel gear shafts and bowl spindle; extra long bearings; strong, sanitary bowl, discs not fastened together; oil bath lubrication; big, roomy, seamless, pressed steel supply tank; both gear shafts and both spindle bearings supported by one solid casting; heavy sanitary tinware; low bowl speed reduces wear on bearings and gears. No raw, sharp edges in the bowl to break up the globules of butter fat. Drop us a postal today.

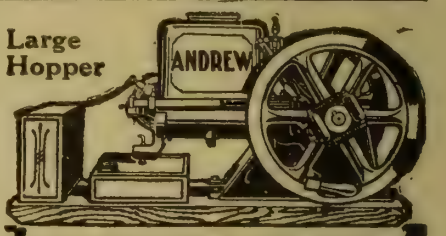
WILLIAM GALLOWAY COMPANY
33 Galloway Station Waterloo, Iowa

"Try-a-bag" of fertilizer. Our brands are soluble and active, and not only increase yield, but improve quality and hasten maturity. Agents wanted. Address American Agricultural Chemical Co., Cleveland, Cincinnati, Detroit or Baltimore.

Large Hopper



Light But Strong

One of the secrets of engine building is to know how to use weight. A part that is heavier than necessary adds just that much to the weight for the farmer to move about, without adding to the power delivered.

By making the cylinder of the ANDREW engine of the same close-grained iron used in the cylinders of six-cylinder automobiles, we get plenty of strength with about one-half the cylinder weight of many other 1½ H. P. engines.

Also about half the total weight of the engine is in the fly wheels—quite an advantage.

While light—165 lbs. complete—the

ANDREW

Gasoline Engine

works so smoothly that it stands without blocking.

Two other features that appeal strongly to most engine buyers are the large water hopper and the extreme simplicity of design.

The ANDREW engine, we believe, delivers as much power as any other small engine of its bore and stroke—and **more** power than most 1½ H. P. engines on the market. It will be to your interest to make a full investigation of the features of the ANDREW engine before you buy. Better write at once. *Dealers wanted.*

FARMER AGENTS: Write for 1916 agency for Diddie-Blitzen Rods—best lightning rod sold. L. F. Diddie Co., Marshfield, Wis.

BUTTERMAKERS' CONVENTION.

(Continued from page 9.)

Windsor, and H. E. Griffen, of Mt. Horeb.

Thursday afternoon was farmer's day and the meeting was held in connection with the short course at Eau Claire. Dean Farrington, of the dairy school, spoke on the opening night on the development of pasteurizing machinery, and J. M. Speed, of Milwaukee, discussed the technical sides of refrigeration. Fuel and power efficiency was discussed by O. A. Storvick, of Minnesota.

At the farmers' session J. D. Jarvis, of Chicago, spoke on the care of cream on the farm and emphasized the importance of properly caring for the cream after it had left the separator. Mr. Jarvis told of experiments which the De Laval Separator Co., which he represents, had made with tanks in which the water was cooled by well water and said that every farmer could have such a cooling tank at little expense and that the quality of cream would be greatly improved thereby.

1. Rinse in lukewarm water the separator bowl and utensils to remove all the milk, etc.
2. Then scrub with a brush with warm water to which has been added some kind of washing powder.
3. Then immerse in boiling water for a few moments.
4. Then invert bowls, buckets, etc., and let dry in pure air and the sunshine.

By all means don't use the milk room for a store house for old clothes, etc., and remember that thick cream always keeps better than thin cream.

Hon. S. A. Cook, of Neenah, gave a very interesting talk on dairy conditions, and E. C. Jacobs, of Elk Mound, dwelt upon the value of co-operation between creamery owner and farmer. C. P. Norgord, commissioner of agriculture, explained the workings of the new department and the plan to place the herds free from tuberculosis on a certified state list.

When the resolutions committee reported a discussion on pasteurization arose which was very spirited and ended in the association voting down a resolution in favor of compulsory pasteurization. Several speakers urged that under present conditions it would prove a hardship and a big financial loss to the butter men and the farmers, but all admitted that pasteurization is coming some day. Resolutions adopted approved the rules and regulations under the new license law; approved the dairy and food commission as now constituted; favored a requirement that whey butter be so labeled when made from whey cream and disapproved the attack on the dairy industry which is unwarranted and untrue.

The association voted in favor of changing the time of meeting to the fall instead of the winter and an invitation to meet in Sparta next year was received. Dates and place of meeting were left to the board of directors.

The winners in the butter exhibit, with their scores, follow:

District No. 1—John Mogenson, Beloit, 90; Louis Schawitzer, Nashotah, R. 22, 93.66; Martin von Liere, Troy Center, 92; C. W. Page, Elkhorn, 93.33; Axel L. Larson, Nashotah, 93; H. O. Zick, Tiffany, 91.16; Harry D. Nichols, Elkhorn, 94.83; John R. Meyer, Slades Corner, 94; Walter J. Clark, Lake Beulah, 92.83; Charles D. Kelly, East Troy, 95.16; F. V. Merryfield, Mukwonago, 93.83; Geo. Christoph, Avalon, 91.

District No. 2—Arthur W. Seager, Cedarburg, 94; H. Skerhutt, Cedarburg, 94.33; Hubert Bartel, New Holstein, 92.33; Arthur A. Olson, Waupun, 96; G. P. Sauer, Cedarburg, 94.50; J. S. Magrane, Fond du Lac, 91.66; Wm. Remel, Maribel, 92.50; Albert Hoefke, Waterloo, 93; Richard L. Sleyster, Endeavor, 90.16; Quirin Morsch, Fond du Lac, 94.33; Wm. Warnke, Kingston, 94.16.

District No. 3—H. P. Nielson, Deerfield, 93.33; A. C. Hilstad, Oregon, 92.83; G. M. Stewart, Mazomanie, 91.50; F. M. Werner, Waterloo, 93.40; Hod Doolan, Marshall, 92.66; W. H. Kubat, Marshall, 95.33; E. R. Smart, Marshall, 93; Carl P. Steder, Helenville, 92; Henry T. Kipp, Cambridge, 91.66; H. J. Herreman, Black Earth, 91.33; H. E. Griffin, Mt. Horeb, 94.66; Alex. Shey, Marshall, 91; Ed F. Bolstead, Stoughton, R. 2, 92.33; R. J. Brigham, Whitewater, R. 3, 92.83; Rudolph J. Else, Helenville, 92.83; John Tenjim, Windsor, 90.16; H. M. Eckwright, Bloomer, 91.50; John E. Mattson, St. Croix Falls, 93.83; J. P. Sorenson, Milltown, 91.33; Ole Esker, Dallas, 93.33.

District No. 10—C. F. Brennecke, Antigo, 91.83; Louis Peterson, Bonduel, 92.33; Carl Jorgenson, Rose Lawn, 96.16; Joel Gilbertson, Medford, 94.16; Hans Christianson, Rose Lawn, 95; W. F. Paulson, Phillips, 90.50; A. N. Anderson, Antigo, 90.83; M. G. Koepsell, Little Black, 93; R. G. Zabel, Wausau, 93.16; Frank Meisner, Wittenberg, 92.

STATE PRIZE WINNERS.

1st, H. H. Whiting, Johnson Creek; 2d, L. L. Bolstead, Basco; 3d, H. M. De Golier, Cambridge; 4th, Carl Jorgenson, Rose Lawn; 5th, Arthur A. Olsen, Waupun.

DISTRICT PRIZE WINNERS.

First District—1st, Chas. D. Kelley, East Troy; 2d, F. V. Merryfield, Mukwonago; 3d, Louis Schawitzer, Nashotah.

Second District—1st, Quirin Moersch, Fond du Lac; 2d, Albert Hoefke, Waterloo; 3d, Hubert Hartel, New Holstein.

Third District—1st, H. E. Griffin, Mt. Horeb; 2d, F. M. Werner, Waterloo; 3d, H. P. Nielson, Deerfield.

Fourth District—1st, Olaf Larson, Fennimore; 2d, John H. Miller, Baraboo; 3d, Frank Shepherd, Mt. Sterville.

Fifth District—1st, D. F. Wallace, Alma Center; 2d, C. D. Simpson, Viroqua; 3d, Frank O'Hearn, Melrose.

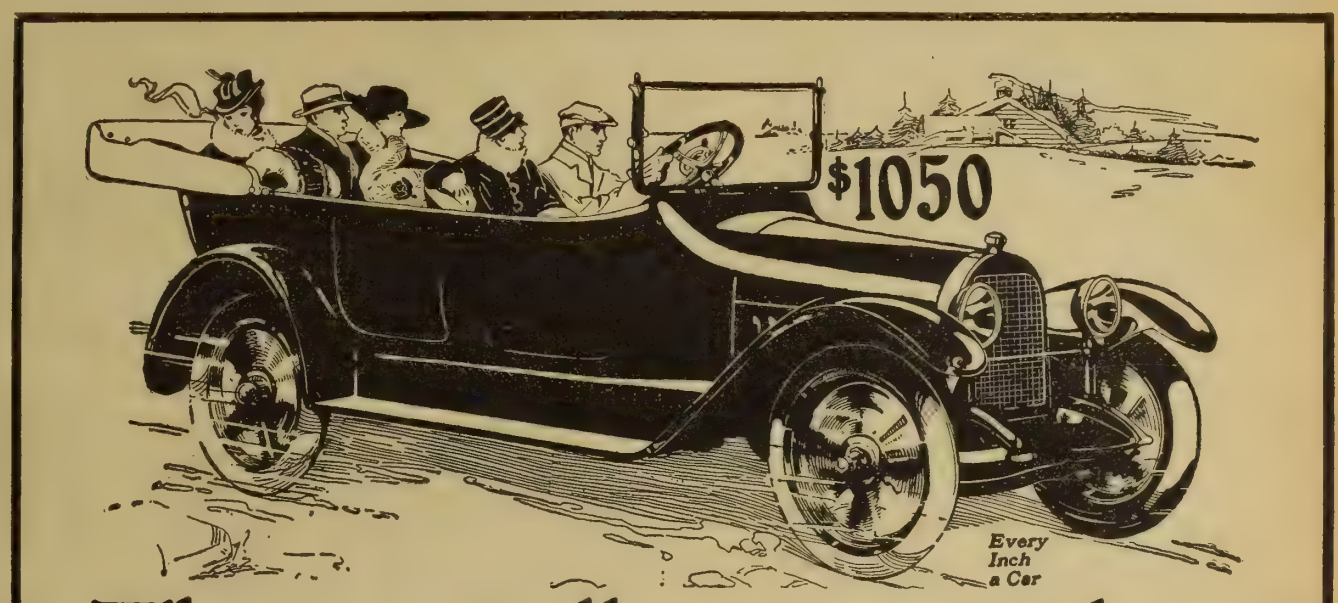
Sixth District—1st, C. J. Jenson, Withee; 2d, Christ Christensen, Neillsville; 3d, Joseph Yager, Thorp.

Seventh District—1st, R. J. Rivard, Merril, R. 1; 2d, R. P. Colwell, River Falls; 3d, Chas. M. O'Brien, Augusta.

Eighth District—1st, Abe Speich, Berlin, R. 2; 2d, L. A. Olson, Waupaca; 3d, C. F. Wolzien, Black Creek.

Ninth District—1st, Hilbert Enerson, Comstock; 2d, Henry S. Paul, South Superior; 3d, E. W. Scheel, Turtle Lake.

Tenth District—1st, Hans Christianson, Rose Lawn; 2d, M. G. Koepsell, Little Black; 3d, Frank Meisner, Wittenberg.



This car will serve you best

YOU are going to buy a car just the way you buy any piece of machinery—*on its record of efficiency*—its ability to more than do the things you expect of it.

To give you the service you require, your car must have plenty of power, lots of room, good looks and long life.

The KisselKar *High Efficiency Thirty-Two at $1050* fills this bill better than any automobile at anywhere near its price.

KISSELKAR

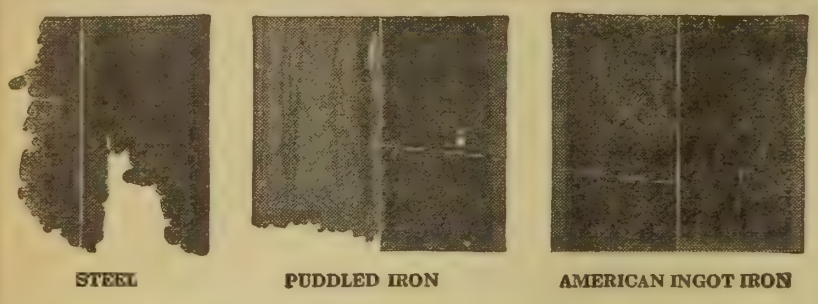
High Efficiency Thirty-Two

This car has been tested in every section of America—where hills are steep and sharp—where sand and mud and chuck holes abound—where altitudes are high—where weather is most severe.

And the reasons this great KisselKar 32 has won such distinction as a car of wonderful road ability are because its powerful motor, its sturdy axles and all other vital parts are Kissel-built—*it's a carefully manufactured car—not assembled.*

The High Efficiency Thirty-Two will suit you—prove it by a demonstration. Write for nearest dealer's name.

Kissel Motor Car Company, 312 Kissel Ave., Hartford, Wis.



STEEL PUDDLED IRON AMERICAN INGOT IRON

The Iron counts, far more than the Galvanizing!

THE above illustrations, reproduced from actual photographs, tell the story of rust resistance. When new all these pieces of metal looked about alike. After three years' exposure under identical conditions the steel was completely rusted out and the puddled iron seriously attacked. But the third was of the same pure iron from which are made

"ARMCO" AMERICAN INGOT IRON CULVERTS

No rusting out here but a perfect piece of metal. No galvanizing or any other protecting material was used on any of these samples. The elements had free opportunity to attack and destroy them. Only "ARMCO" IRON stood the test. Its rust resistance is due to its uniform purity and the scientific care given its manufacture.

For full information on "ARMCO" Iron Culverts, Flumes, Sheets, Roofing and Formed Products, write the manufacturer in your vicinity, or

Armco Iron Culvert Manufacturers' Association
CINCINNATI, OHIO

All the time, expense and hard work of discing, harrowing and dragging now done away with. Just hitch a Kramer Rotary Harrow behind your plow and do it better, all as you go. Pulverize the moist soil right behind the plow, without any extra horses.

The Kramer Rotary Harrow

Keeps all the moisture right in the soil. Makes a fine seed bed that germinates the seed quickly—no clods or dry dirt to hold back your crops—no missing hills or uneven stands. Easily attached to any plow. Light draft. Adjustable to any depth. Endorsed by agricultural colleges, big ranchers and farmers everywhere. Every user an enthusiastic booster, because it saves extra teams and helps right at the busiest time of the year. Get full information and big illustrated catalog free.

SATISFACTION GUARANTEED.

Remember, this harrow does not cost you a cent unless it does exactly what we claim it will. University of Illinois, at Urbana says: "We regard these Rotary Harrows as one of the best means of conserving the moisture of the soil, together with ease and efficiency in pulverizing, that has ever been our pleasure to work with." Hundreds of other such reports, all claim that the "Kramer" Harrow does more than discing and harrowing the old way. Extremely low in price. Write for all the facts and FREE TRIAL OFFER. Agents get our proposition.

KRAMER ROTARY HARROW COMPANY,
215 Main Street MORTON, ILL.

10 Right Size-Right Price HEIDER For Every Farm TRACTOR

The real one-man Tractor, backed by eight years of service on hundreds of farms. Right in size to meet most every demand on any farm; small enough to go anywhere and be easy to handle. Big enough to supply all power needed. Has special Friction Drive Transmission. Means easy operation, variation of speed and long life. 4-cylinder motor, 10-20 H. P. Burns kerosene, gasoline and motor spirits. Steel frame. Seven speeds forward and seven reverse. The Heider is the pioneer light tractor. Not an experiment or a freak, but one that has been tried and proven.

Pulls three plows, harvester, drills, harrows, graders, drags. Drives cream separator, feed grinder, corn sheller, ensilage cutters, small grain separators, etc. It's the Power King that reduces farming cost.

In and Around Wisconsin

Creameries at Annual Meetings Report Prosperous Year With Good Prices to Farmers For Their Product.

The Wisconsin Bankers' Association will meet this year at Madison, June 22d, 23d and 24th.

The Jefferson County Order of the Experiment Association will hold its annual meeting and grain show at Lake Mills on February 26th.

Farmers, shippers and buyers of cattle are co-operating at Green Bay with the expectation of building a stockyards there this summer.

Stock sales to date for the proposed co-operative packing plant at New Richmond, St. Croix county, total $235,000, leaving a balance of only $15,000 to be secured.

The Clear Lake, Polk county, creamery hit a new production mark in 1915 by making 811,000 pounds of butter, compared with 697,175 pounds in 1914, an increase of 113,825 pounds.

F. S. Campbell, of Oneida county, one of the well-known potato growers of the state, recently shipped a carload of certified Irish Cobbler seed potatoes to California at $1.25 per bushel.

John Haerle, of Milwaukee, has purchased and taken possession of the Hartland creamery at Hartland, Washington county. The seller was C. B. Harbaugh, who retired to look after other business interests.

W. W. Clark, of the Wood County Agricultural School, and William Bassler, official tester for the county cow-testing association, are organizing a second association in the vicinity of Grand Rapids and have entered 300 of the required 500 cows to start an association.

February 12th will be seed corn testing day in Walworth county and it is suggested that on that date every one begin a test for the 1916 seed. The teachers of the county are cooperating and much good will undoubtedly be derived from this county-wide movement.

The following breeders were elected officers of the Fond du Lac County Guernsey Breeders' Association at the annual meeting recently at Ripon: President, Math Michels, of Peebles; vice president, W. A. Lawson, of Rosendale; secretary and treasurer, F. M. Ingalls, of Fond du Lac. The association has 250 members.

Another cow-testing association has been organized in Manitowoc county as the result of the farmers' institute recently at Mishicote. The officers of this new association which will begin work immediately are: George Barthels, of Mishicot, president; Albert Johannes, of Two Rivers, Secretary and treasurer; Oscar Samz, Albert Braun and Wm. Bertolaet, board of directors.

Albert Fuller, of North Lake, who is behind a project as president of the Milwaukee Milk Shippers' Association to establish a milk depot in Milwaukee, announces that he has secured almost 400 signers. They propose to incorporate a company for $10,000 and sell milk directly to the city consumers in Milwaukee. Mr. Fuller declares that this is the only way the farmers can secure justice from the dealers in Milwaukee and secure a fair price for this product.

The Marathon County Agricultural Society has chosen September 5th-8th as the dates for the next fair at Wausau. The association is planning many improvements this year, including new swine and horse barns, and it is hoped the county board will assist with an appropriation. At the recent annual meeting these officers were chosen: President, B. F. Wilson; secretary, J. D. Christie; treasurer, A. H. Zimmerman; superintendent of speed, G. A. Mills. Board of directors: Arden Paronto, of the village of Mosinee; W. F. Lemke, of the town of Berlin; J. H. Vogt, of the town of Brighton; F. J. Bandy, of the town of Flieth; Herman Ramthun, of the town of Wausau; J. D. Christie, of the town of Weston; B. F. Wilson, A. H. Zimmerman, L. H. Cook and S. M. Quaw, of Wausau.

Grant county lambs topped the Chicago market recently when a carload marketed by Sam S. Johns, of Montfort, brought $10.75 per hundred.

The Jefferson County Fair Association has elected the following officers for the year 1916: President, A. R. Hoard; vice president, William Higgins; secretary, R. B. Hellen; treasurer, William Henry.

Brown county creameries report a very prosperous January and during the last week of the month the West DePere creamery paid the highest price for butter fat, 39 cents. The Fox River Valley creamery paid 36½ cents and the South Lawrence company paid 34 cents.

Secretary Gavin McKerrow has given us some additional figures on the Waukesha County Guernsey Breeders' Association. The association has 127 paid members, an increase of thirty-nine in the last two years. There are sixteen new members proposed at this time. The association is in a most flourishing condition.

The Outagamie County Cheesemakers, Buttermakers and Dairymen's Association was organized recently at a meeting at Appleton at which these officers were chosen: A. F. Peterson, Grand Chute, president; William Menning, Greenville, vice president; N. Simon, Jr., Appleton, secretary; P. H. Grienert, Freedom, treasurer. The association started out with fifty members and about 300 farmers attended the organization meeting.

The increase in dairying in the St. Croix valley is indicated by the annual report of the Star Prairie Cheese Company, which has handled about 3,300 pounds of milk daily during the past year. The year previous the factory ran only every other day, as it was impossible to get sufficient milk to keep it going daily. The average price paid the patrons for fat during the year was 33.71 cents. The average price received for cheese was 13.73 cents.

The past year was the most successful in the history of the co-operative creamery at Knapp, Dunn county, which was organized eleven years ago. Patrons received 1½ per cent premium, amounting to $2,200 on butter fat for the year in addition to 8 per cent to the shareholders. At the recent annual meeting H. W. Jodell was chosen president; Frank Lierman, secretary, and William Casey, treasurer. George Hart, Fred Larson and Herman Hellendrung were elected directors.

August 29th, 30th and 31st have been chosen as the dates for the 1916 fair of the Manitowoc County Agricultural Society. The treasurer's report shows a balance of $1,400 in the treasury at the end of the year which is very gratifying. This is an increase of more than $400 over last year. The fair last year reported total receipts of $9,899 and was one of the best ever held. These officers were elected for 1916: President, John Kellner; first vice president, M. H. Dempsey; second vice president, Jay Hall; secretary, Fred Borcherdt, Jr.; treasurer, F. T. Zentner.

The Guernsey breeders of Polk county held their annual meeting and love feast at Amery on January 15th. It was one of the most enthusiastic meetings that the association has ever held. Several new members were received and John Klinka and R. L. Cuff, county agricultural representatives of Polk and Barron counties, respectively, spoke. These officers were elected for the coming year: President, J. H. Stewart; vice president, J. C. Tanner; secretary, E. T. Stewart; treasurer, W. H. Scott. Directors, S. B. Vassau, J. P. Jensen, John Klinka, Andrew Eastlund and O. T. Jensen.

What Standardization Means to Motor Car Buyers

IT means VALUE. Just to the extent that a car is standardized does the buyer's dollar approach the maximum of purchasing power.

Standardization means definite, proved quality, known manufacturing costs and reduced selling costs.

Of the million autos that will be sold in 1916, 75% will be standardized cars selling for less than $1000.00 each. This remarkable American achievement is the direct result of standardization.

Finally the upholstery has been standardized by the almost universal adoption of

DU PONT FABRIKOID

MOTOR QUALITY

40% of all 1915 cars sold were upholstered in this proved, guaranteed material and in 1916 the total will be at least 60%.

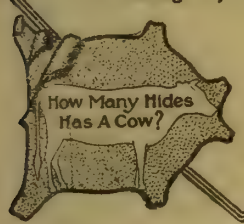
Fabrikoid is the only standardized automobile upholstery. It wears better than coated splits (commonly sold as "genuine leather") and has the artistic appearance and luxurious comfort of the best leather.

Rayntite Fabrikoid for tops, single or double texture, is guaranteed one year against leaking, but made to last the life of the car.

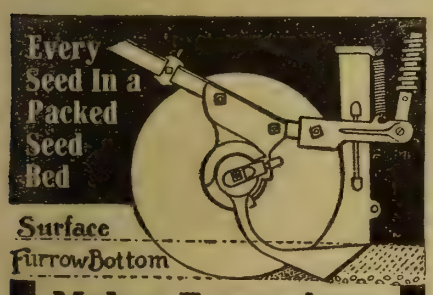
To get the most for your money, buy a standardized car

Du Pont Fabrikoid Co.

Wilmington, Delaware



Craftsman Fabrikoid, the artistic upholstery material for furniture and home decoration is sold by leading department stores.



Makes Every Acre Yield 10 Bushels More Oats

Drill your oats instead of seeding. It means more profits for you. With the New Peoria Drill you can give your yield per acre a good big boost. The disc shoe lays every seed in a packed bottom and *covers* it. No seed is left exposed to birds and weather. The

Peoria Drill

Starts the Crop Perfectly

Drills any of the small grain, or peas, beans and corn without injuring seed. Every seed counts. It's covered as it should be. All seed is planted at uniform depth—grows evenly—the whole field ripens uniformly—grain grades better in the market.

You can well afford to discard any other drill or any seeder for the New Peoria. Better crops pay back its cost quickly. Write for catalog featuring 18 sizes—big 48 inch wheels with long hub and wide tires.

COUNTRY LIFE CONFERENCE.

An interesting program has been arranged for Country Life Day at the college of agriculture in Madison during Farm and Home Week. The set day for this country life conference is Friday, February 11th. Meetings will be held in Agricultural Hall, Room 305. Ernest N. Warner, president Wisconsin Country Life Conference, will open the session with an address and the morning Round Table will be on "First steps in country development," and will be conducted by C. J. Galpin. The Round Table on "First steps in rural public health" will be conducted by W. D. Frost. Mrs. Adda F. Howie will speak in the evening on "Better Rural Living."

A PRACTICAL BARN PLAN.

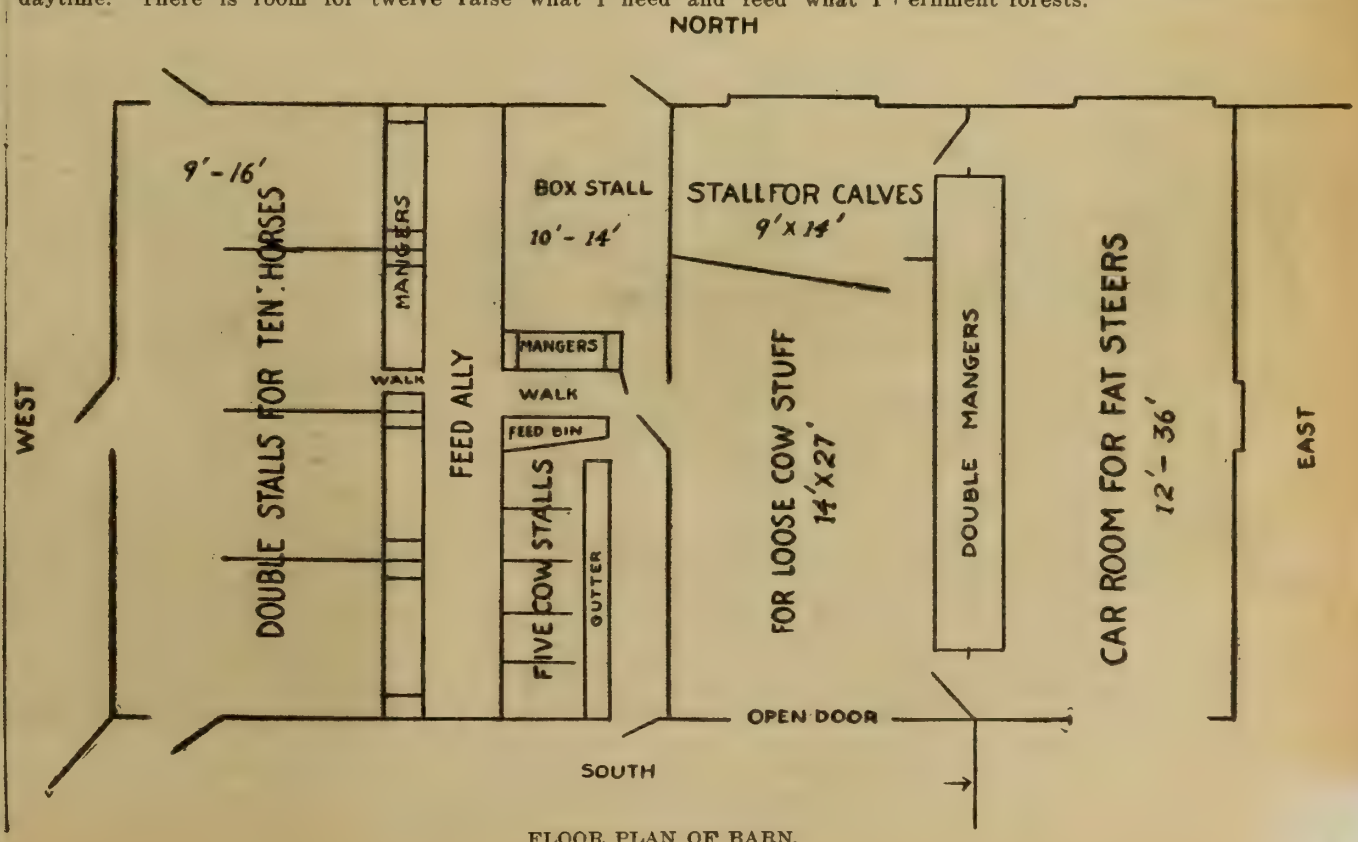
G. H. Plagmann Describes Structure That Has Proven to Be Well Adapted to 160-Acre Farm.

I am sending you under separate cover a floor plan of my all-purpose barn which might be of some interest to some of your readers. I am also sending a photograph of the barn.

Just a word about the barn plan. I think it is a good everyday barn for the 160-acre farmer, as he has room for eight work horses and in a pinch he can take care of ten by using the box stall. The box stall has several other useful ways in any barn. There is room for five milk cows, about as many as the average farmer has, a stall for six or eight calves such as

BARN DESCRIBED BY MR. PLAGMANN.

have to run with the cows during the summer and at weaning time feed in this stall, and for exercise they can be turned in with the fat cattle in the daytime. There is room for twelve to eighteen loose cattle, such as every farmer has, and last, but not least, room for a carload of fattening steers. Now I find that one can raise about feed enough for the above amount of cattle on a 160-acre farm (of course, this means a silo), although I have bought some corn the last few years on account of not raising a normal crop out here. But my theory is to raise what I need and feed what I raise and buy and sell a little to make it balance up.



FLOOR PLAN OF BARN.

SALES THAT SUIT

The entire energy and resources of the largest and strongest organization existing in our line of business is concentrated upon getting top market prices for every consignment, large or small. That's why it pays to ship to CLAY, ROBINSON & CO.

Buildings a Good Investment.

Farm Buildings Should Be Well Constructed With an Eye Single to the Purposes Which They Will Be Called Upon to Serve.

HOME FOR THE LIVE STOCK.
Good stabling a necessity, either in mixed farming or in specialty farming with live stock.

MINNESOTA DAIRY BARN.
Properties of the Woodlawn Dairy Farm, Owatonna, Minnesota, George M. Flinn, proprietor. Roomy and Well Ventilated Dairy Barn.

THE OLD HOME AND THE NEW.
A northern Iowa farmer has pushed back the old farmhouse and is building a modern one in its place.

PROSPERITY ON A MISSOURI ROAD.
These improvements are not new, but they have been kept up in good shape and will give long service.

WHERE THE FAMILY ENJOYS LIFE.
This modern farm home has every convenience and there is no incentive for the young folks to move.

SOLID COMFORT FOR ALL.
Good improvements at reasonable cost serve well the needs and comforts of man and beast.

UPPER WISCONSIN

OUT OF THE LOG BUILDINGS.

Fifteen years ago Alois and Joe Stengl, Bohemians by nationality, became Upper Wisconsin farmers when they invested their savings in cut-over lands in Langlade county, a few miles from the city of Antigo, and began making their fortunes from the soil. The Stengl brothers went into that country under the same conditions that thousands are going into Upper Wisconsin today and by following out the best farming methods they are realizing today the dream they had when they took up their residence there several years ago.

THE LOG FARM BUILDINGS AND HOUSE WHICH SERVED THE STENGL BROTHERS UNTIL THEY COULD BUILD MORE MODERN HOMES AND BARNS.

Alois Stengl, thirty, economical and energetic, did the best he had with the means at hand and from the day he began cutting out the second growth timber, removing the stumps and preparing the land, he had the desire to some day own a fine dairy herd, a fine barn for this herd, a modern residence and those conveniences that the farmer is entitled to and deserves. That was the dream, as he called it then, and when the big barn, the silo and the residence he now has under construction are completed this spring that dream will have come true.

NEW AND COMPLETED BARN AND SILO OF JOE STENGL, LANGLADE COUNTY, IN WHICH HEMLOCK TAKEN FROM THE WOODS NEARBY WAS USED FOR THE BEAMS AND THE RAFTERS.

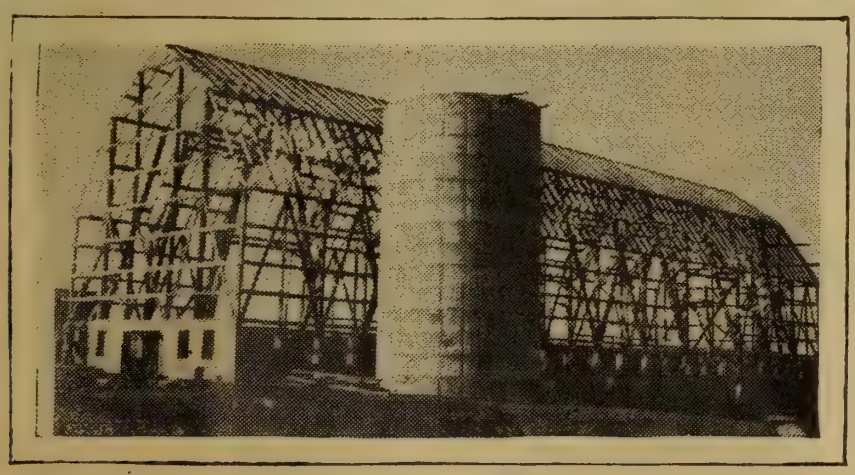
Stengl is building a barn which would do credit to most any community; his big concrete silo attached to this barn will provide the succulent feed and fine grade Holstein herd requires during the winter months and in his new home he will enjoy the comforts of the city man who has everything modern and up to date. These improvements are being made from the profits of fifteen years of farming in Langlade county; the sale of adjoining lands he had the vision to buy and clear years ago.

Recently when an editor of The Wisconsin Farmer was in Antigo, F. G. Swoboda, county agricultural representative, said he wished to show the writer what could and had been done in Upper Wisconsin where the right man was in control. So he drove the writer to the farm of Alois Stengl and then to the farm of Joe Stengl, his brother, only a few rods away and across the road.

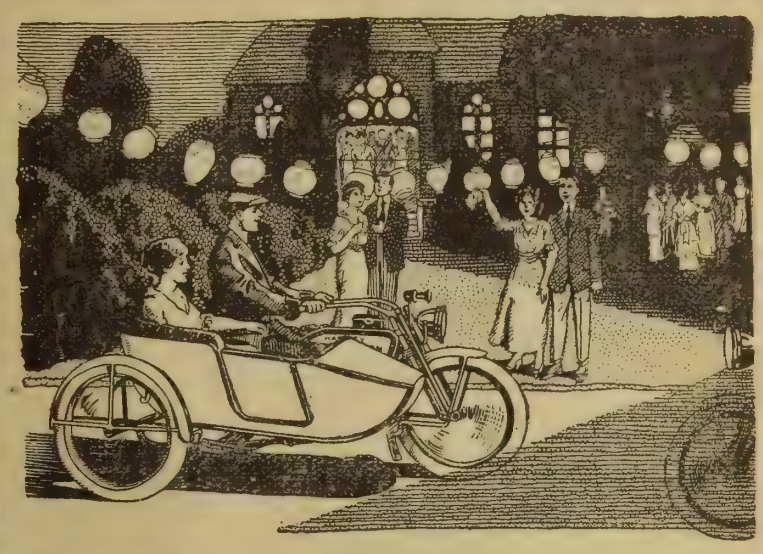
"You don't have to go to the old, established sections of Wisconsin to find fine dairy barns and homes," Mr. Swoboda remarked before we left Antigo, and one glance around after reaching the Stengl farms readily convinced the writer that he was correct.

Alois Stengl's new barn is thirty-six feet wide, 138 feet long and has accommodations for sixty-five head of cattle and six horses. It is modern in every respect and the picture shown herewith was taken just as the framing was being completed and shows for itself the substantiability of construction.

Particular attention has been paid to ventilation and light and this barn will be as nearly ideal as a cow home can be made. There are forty-eight



ALOIS STENGL, LANGLADE COUNTY, BUILDING A BARN FOR THE FUTURE, AS WELL AS FOR TODAY. NOTE THE SUBSTANTIAL CONSTRUCTION AND THE BIG, CONCRETE SILO.



Now You Can Come and Go

WHEN there's an entertainment at the church—or a good show in town, or a dance, or a party at the home of a distant neighbor—then you will be glad you own a Harley-Davidson. You'll find a dozen good uses for it during the day, of course, but when the day's task is done and you are too tired to enjoy walking or driving, then you really enjoy your

Harley-Davidson

With a sidecar (detachable in a few minutes) the Harley-Davidson becomes a family vehicle, a never-ending source of recreation—wonderfully soothing to tired nerves and muscles.

Considering all that the Harley-Davidson Motorcycle and sidecar will mean to you, it is really easier for you to own one than to do without. Most dealers will arrange terms to suit your convience.

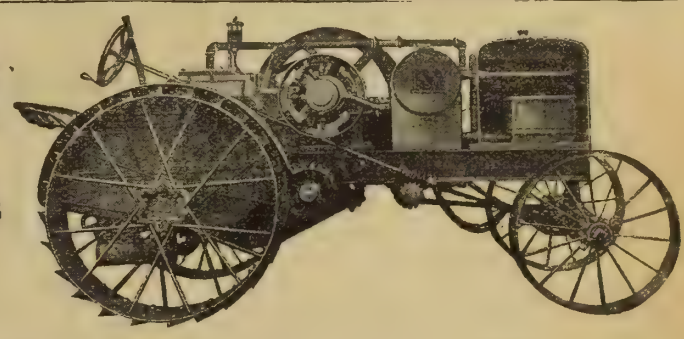
If you do not know your Harley-Davidson dealer, write for catalog.

HARLEY-DAVIDSON MOTOR COMPANY

Producers of High Grade Motorcycles for More Than Fourteen Years

1155 A Street, Milwaukee, Wisconsin

EAGLE GAS Tractors



Built for Wisconsin Farms

Here's the EAGLE TRACTOR built especially for Wisconsin farms. It is the famous EAGLE two-cylinder engine in tractor form. Does all that is required of a tractor and delivers an abundance of smooth power for all belt work such as threshing, ensilage cutting, etc.

The EAGLE GAS TRACTOR will stand rough and ready usage. It is just the right weight to be practical on any medium-sized farm. All unnecessary weight has been cut out, yet nothing that would add to the strength, durability or *dependability* has been sacrificed.

This tractor is simple in construction, simple in operation and easily accessible. The average man can readily learn to work it or keep it in repair without help.

FOUR MODELS

8-16 Two Cyl. Weight 4850 lbs.
12-22 Two Cyl. Weight 5030 lbs.
16-30 Two Cyl. Weight 5700 lbs.
16-30 Four Cyl. Weight 5500 lbs.

All EAGLE GAS TRACTORS have four wheels with two drivers. They pick up a sudden load and get to normal speed quickly and smoothly. All have the famous EAGLE Valve-in-Head motor and use low grade fuel, giving low operating cost.

Every Wisconsin farmer should learn about EAGLE GAS TRACTORS. Write at once. 21

EAGLE MFG. CO., 670 Winnebago Street APPLETON, WIS.

Are You Discontented
-Tired of Being a Renter?
Then —
Come to MONTANA

Worn out land means small returns for much hard labor and it is discouraging to work hard from morning until night and get no more than a bare living.

In Montana there are millions of acres of rich virgin land that await the industrious man to convert them into wealth-producing areas—here your labor yields large returns—you work no harder but soil and climate do.

Here are 10 year average acre yields: Wheat, 25.85 bu.; oats, 44.63 bu.; barley, 34.61 bu.; rye, 22.25 bu.; potatoes, 149.40 bu.; hay, 1.82 tons. You can make money with such crops.

Learn more about this wonderful country. Send for literature now—then in the spring take advantage of the low fares and go out there.

Schmidt & Stork Wagon Co., 123 Mill St., West Bend, Wis.

windows in the basement, which are equal to the wall space, and through the center there is a big driveway which will permit a wagon to pass through. Mr. Stengl had many of his own ideas which he worked into this barn. For many years—the years he has been dreaming of such a barn—he has been sketching barn plans at night and getting ready for the time when he could afford to build. He worked out many of his own ideas and the barn was practically designed by him, with the assistance of Mr. Swoboda. Mr. Stengl was anxious that it be the last word in barn construction, as he expected it to stand for many years, and, like the progressive farmer, he studied barn construction, took all the suggestions he could take and then worked in his own ideas as they had developed from practical experience.

When the writer visited this farm Mr. Stengl was found up among the rafters sawing and nailing, as the barn was built under his personal direction, and he has helped handle every timber that has gone into it. The basement is of concrete and when

THE NEW MODERN FARM HOME OF ALOIS STENGL, PARTLY COMPLETED.

the construction is complete it will be equipped with the most modern stanchions, litter carriers, etc.

The silo, which stands at the side, was also built under Mr. Stengl's direction and by himself and farm labor. Fortunately, he had the gravel close at hand and this he dug a few feet from where the silo stands. This silo stands thirty-six feet high and is fourteen feet in diameter and is of concrete. Beside it sufficient space has been left for another silo of equal dimensions, as Mr. Stengl sees the day when he will need two instead of one in order to provide the necessary feed for his cattle.

The barn floors, etc., are all of concrete and Mr. Stengl plans a concrete yard, covered with dirt so that the stock will not mire in the muddy weather. The loft, as well as the entire building, is very large and will hold in the neighborhood of 150 tons of hay. He also has a manure pit which will catch and hold all the good qualities of this fertilizer.

Most farmers would either build the barn or the house first, but Mr. Stengl built both at the same time and the house was nearly completed when the writer was there. It has eight rooms and will be as modern as it is possible to make it.

These improvements Mr. Stengl is making after living in the little log house as shown in the illustration on page 17. The old barns are also of logs and native hewn timber and these old buildings are located just a few rods east of where the new ones are situated. They have served their purpose and during the time they have been in use Mr. Stengl has cleared most of his land and secured the means for the new buildings.

Holsteins and Chester White swine have been the favorites with Mr. Stengl. He has eighty acres in his farm, seventy of which is cleared, and with the use of a pure-bred sire he is grading up his herd so that today he has one of the nicest high-grade herds in the county. He has given much attention to potatoes, as most farmers have in that community, and has found this a very profitable crop. During the last year or two he has been growing certified seed. Mr. Stengl would not advise any farmer in his vicinity to go into swine raising exclusively, as he does not favor swine except to take care of the waste on the dairy farm and for this purpose he has found the Chester Whites money-makers for him.

Progressiveness runs in the Stengl family, as Joe Stengl, his brother, whose farm is only a short distance away, only recently completed a new barn which ranks in size and up-to-dateness with that of Alois Stengl. Joe Stengl has also built a new home and does not intend to be outdone by his brother.

The barn on the Joe Stengl farm is 40x135 feet and resembles very much, as shown by the accompanying picture, the barn of his brother. He is also a certified potato grower, has eighty acres, of which sixty-five is under the plow, and is building up a good herd with the use of his brother's pure-bred sire. Most of his cows at present are natives, but he is working gradually into the strictly dairy breeds.

Like his brother, Joe Stengl, with the help of neighbors and others, built his own barn and a better constructed one the writer has never seen. The rafters and beams are all of native hemlock, cut from the woods by the Stengl brothers themselves. By using this timber they were able to save large sums, as it was not necessary to buy the heavy, expensive timbers. This barn is also fully equipped with the most modern equipment and connected therewith is a concrete silo, 14x40 feet. This concrete work, as well as the brick partitions, etc., in the barn was done by Mr. Stengl. The lighting and ventilation has had special attention. The silo and the straw pile cut off the view in the picture of the many windows in the dairy part of the barn, but there is sufficient window space to let in plenty of sunshine—one of the great requisites of the modern barn.

What these two brothers have done should be an inspiration to the farmer who is struggling along in the old, old way. Neither of them were endowed with any great amount of cash capital, but they were energetic, progressive and thrifty and they have made this Langlade county cut-over land, with good cows and hogs, provide for them good, modern, comfortable homes and farm buildings just as comfortable for their stock.

HORTICULTURAL TOPICS

THIS department is conducted by an experienced horticulturist. All questions relating to horticulture will be answered if of sufficient general interest to warrant a reply in this department. Communications and inquiries upon horticultural topics should be addressed to this office.

AS TO HOTBEDS.

The time to begin hotbed work for early garden plants depends very much upon the latitude of the gardener. For south Wisconsin and north Iowa the first to tenth of March is plenty early enough. In all places it depends upon what you plan to use hotbeds for. If you plan to grow lettuce and radishes for market or for your own table you may, with advantage, start the crop weeks before you need to plant cabbage, tomato and other seeds to get the plants for the garden.

For growing vegetables which are to come to maturity in the bed the earlier you begin operations the better, provided you are ready to protect the beds against possible cold snaps. For this purpose you should choose an especially favorable location, one with a south front, and with good wind protection on the north. In this case even the first of February is none too early, but to do it then requires foresight to have soil in convenient shape and place. Then, if you have well-made, tight frames, well set and tight glass, and good mats for night covering you can have your vegetables up by March 1st.

In the growing of tomato and cabbage plants it is a rule for the gardeners to allow six weeks from the seeding to the garden transplanting. That means that if it is safe to transplant to the field May 15th, April 1st is the time to sow the seed.

But again circumstances alter cases, and if you have provided plenty of hotbed room so that you can transplant once in the beds to secure extra stocky plants, then you may sow these seeds in March or even February. This is the way to get very early tomatoes. Having plenty of room, when the plants have reached the four-leaf stage, transplant, giving each one two inches of room. They may stand there until they are four or five inches high. Then transplant into flats, where they are to remain until taken to the field the middle of May. But leave these flats under the glass so that you can protect them at night.

In all these operations you must use plenty of water, and after transplanting give shade for a couple of days. When the warm days of spring come remove the glass entirely during the daytime, replacing it at night. In this way your plants will become more stocky and healthy than if kept covered. And this is as true of lettuce and radishes as of the other plants. To grow good lettuce and radishes you must allow plenty of room. The temptation is to crowd them because your space is limited, but that always proves to be a fatal error. Let radishes have two inches of space and lettuce four if you would have proper development.

A very good way to start cuttings of the grape and currant is to use the bottom heat principle, as secured by the hotbed. But for this purpose you will need a thicker surface layer of soil than for the vegetable plants. Also, other soft-stemmed plants which need sand and heat to grow from the cutting, like geraniums, will respond very readily if given this opportunity. There are many gardeners even, not to mention amateurs, who do not fully appreciate the possibilities of the hotbed.

JEFFERSON COUNTY GRAIN SHOW.

The Jefferson County Order of the Agricultural Experiment Station will hold its annual grain show at the Water and Light Company Hall, Lake Mills, Wisconsin February 26th, at one o'clock. A good program is being prepared and there will be a fine exhibit of products and good prizes awarded. Prof. R. A. More and Prof. J. G. Halpin, of Madison, and Supt. A. J. Thorne, of Jefferson, will speak.

Ask your neighbor to subscribe for The Wisconsin Farmer.

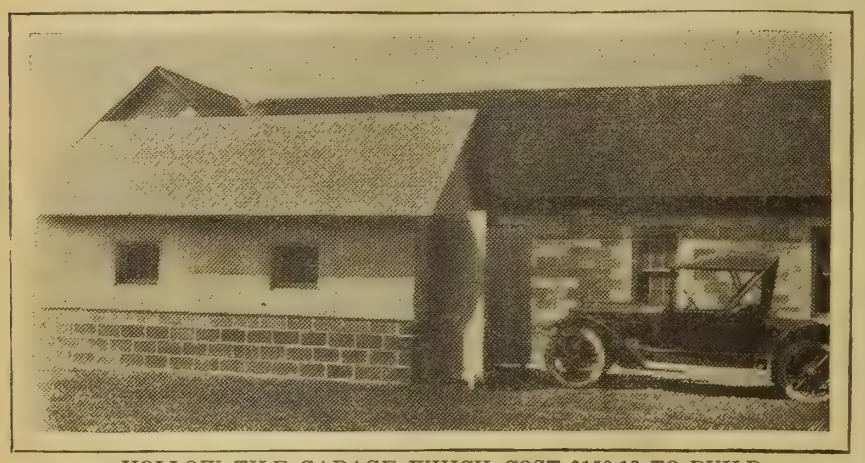
FIREPROOF FARM GARAGE.

Good Garage May Be Erected Complete With Hollow Block Construction at a Reasonable Cost--By E. G. Zorn.

THOUSANDS of farmers and stockmen are taking long chances in housing their automobiles along with their cattle or other valuable property. A separate building—a fireproof garage—should be erected to receive the car after its day's work.

But safety from fire is not the only reason for building a garage. Owing to the value of this piece of machinery with its many intricate parts, a suitable and adequate protection should be provided—something more than a corner in the stable where there is often much dampness in the air to rust the metal parts or disintegrate the tires, and litter to be tracked into the car or be thrown against its sides in passing. These sides, by the way, are covered with a delicate coat of enamel which rough handling soon mars and disfigures. This last-mentioned advantage of a garage—that of protection—is particularly emphasized where the leaving of the car out in the open overnight or for several days, has become a habit.



HOLLOW TILE GARAGE WHICH COST $152.13 TO BUILD.

While the lack of time or money, or both, have been offered as excuses for not building a garage, it is more often a failure to realize the seriousness of exposing his property to fire or the unnecessary waste resulting from housing the car in poor quarters or none at all, that is the real reason for most farmers not having a garage. However, where insufficient time seems to be the obstacle, it might be well for the farmer to stop and consider if the building of a garage is not more important than some of the tasks that are now taking up most of his time. In most cases it will be found that this is true.

Disproving the belief that a large sum of money is required to provide a shelter for the car, the garage shown in the first of the accompanying illustrations is offered as a solution to the problem, its cost being $152.13.

This building is twelve feet wide, twenty feet long and eight feet high to the eaves. Hollow clay building tile, eight inches in thickness, were laid upon a conduit foundation, for the base wall. On top of these were laid six-inch hollow tile to the eaves, these last mentioned tile being covered with white stucco on the exterior surface. The roof is three feet high at the ridge, being constructed with a wooden frame which is covered with asphalt shingles. On the inside of the building the walls and ceiling are plastered. This, however, may be omitted and the cost of the building lowered. The floor is of cement. Two single-sash windows and a double end door complete the equipment of this remarkably attractive and well-built garage.

In order that anyone who is contemplating the erection of a garage may have the opportunity of figuring on a fireproof, permanent, low-cost-of-upkeep, dry and good looking building, the itemized figures showing the exact actual cost of this garage are shown in the accompanying table.

FIREPROOF GARAGE ON FARM IN CERRO GORDO COUNTY, IOWA.

For the benefit of the uninitiated in the realm of hollow-tile masonry, it might be said that the conduit "seconds" referred to in the above list of materials for both the foundation and the floor are very similar in size, shape and substance, to a hollow tile. In fact, these conduits are not usually obtainable by the average builder on the farm, and may very readily be replaced by first quality hollow tile at perhaps a slightly higher cost. It might be said in passing that conduits are not manufactured as a building material, but for use in protecting telephone and telegraph wires when laid underground. However, owing to the rigid inspection which this material has to pass before being accepted by the inspectors of the purchaser, some are rejected because of slight defects. These "seconds," being strong and impervious to moisture, are used wherever obtainable for foundation work in residences of not more than two stories.

It will be noted that hollow tile—or conduits, as it happens to be in this case—were laid for the floor with a topping of cement, perhaps one or two inches in thickness, spread over them. This form of construction makes a dry floor, due to the insulating air spaces in the tile—an advantage not to be underestimated when it is remembered that rubber tires have to rest on this floor many hours every day and sometimes for days at a time. Disintegration of the tires and rust of the machinery is thus obviated. The lack of this feature is a great objection in floors of solid masonry, which, it is claimed, draw dampness from the earth beneath. Whether or not this is true, there is no denying the fact that a solid floor is colder and, therefore, more liable to condense moisture upon its surface than one that is provided with insulating air cells through which neither moisture nor heat will readily travel.

A hollow-tile farm garage in Cerro Gordo county, Iowa, is also shown herewith, this building being different in size, design and finish than the one first shown. Hollow clay building tile 5x8x12 inches were employed in its construction, no stucco being used. The roof consists of a wooden frame with a fireproof composition roofing paper laid over it and cemented. The cost of this building was not obtained, but it is estimated at about $125 and surely not more than $150. Both of the garages here shown are built to accommodate one car.

Get a KING Plan of Ventilation for Your Barn

IT takes years of experience to know how to design the right plan of ventilation for a farm barn. No two barns are alike—no ventilation problems are alike. Each requires a special plan—worked out to meet the conditions. That's why you need a King Plan—prepared by the King Board of Experts—and backed by many years of experience in ventilating thousands of farm barns. This is the personal service that goes with every

KING System of Ventilation

Planned Individually for the Building it Goes Into

Before we point out the location of a single intake or flue, we go to the heart of your ventilation problem. Then we design a plan according to the conditions and construction of the building. This accounts for the certainty of satisfactory results with a King System.

The King Aerators, which set on the roof, are the first part of the King System; you can have them with or without a complete system. If you are not ready for the complete system right now, at least put King Aerators on your barn and in the meantime ventilate the hay mow or upper part of the barn and add beauty to the building.

Send for These Books

One is our catalog, which is free. The other is Prof. King's Book on Ventilation (sold heretofore for 75 cents) mailed for 10 cents to cover postage and packing.

King Ventilating Co.

Owatonna Minn.

WAIT! BEFORE YOU ORDER

Seed or Nursery Stock let me send you our wonderful, new, different and original four-color seed book—an eye opener—the Royal Purple Grand Champion line of pure tested field and vegetable and flower seeds, also fruit trees, vines, shrubs, etc., at new, surprisingly low prices.

REMEMBER Nothing is so good but what it can be better. Thousands who have bought from other firms for ten and twenty years tell us we give better seeds at lower prices. Investigate. Get our book. Try our seeds and nursery stock. You will say the same thing. All I ask you to do is just get our book, look it over, try our seeds—be your own judge.

Galloway Bros. & Co., Dept. 31 Waterloo, Iowa

WANTED

MARCH 1st, good man to help care for herd of thoroughbred Holsteins and assist in general farm work. Must be dry hand milker. Give experience and wages wanted in first letter. C. J. Taylor, R. 3. Whitewater, Wisconsin.

PATENTABLE IDEAS WANTED. Manufacturers want Owen Patents. Send for three free books; inventions wanted, etc. I market your invention without charge. Richard B. Owen, 37 Owen Bldg., Washington, D. C.

Besides being low in cost, these buildings are absolutely fireproof—a quality that is inherent in the material of which the walls are built. Hollow tile, in its manufacture, receives a baptism of fire in the kiln and emerges immune from the effects of future heat.

Hollow tile makes a building that is permanent—one in which the cost of upkeep is practically nothing. Your first cost is your last cost with a building of this type. These garages are neat in appearance. No, they are more than that, they are handsome, a distinct addition to the land upon which they stand. The one in which the white stucco finish was used, together with the brown glazed base wall and green asphalt shingle roof, presents a particularly attractive appearance. And the best part of it is that these colors are lasting. No paint is needed to restore faded tints, for the color of these materials does not fade.

How a Farm Success Was Made

H. G. Jamison, For Thirty-one Years a Farmer in Outagamie County, Tells Wisconsin Farmers a Few Experiences.

[Editor's Note.—At the request of the editor Mr. Jamison wrote the following for publication in this paper.]

THIRTY-ONE years ago this coming spring I started in on an eighty-acre farm, in a small way, with a few head of common cattle. In fact, all we had was common, and, being somewhat of a novice at farming, made quite a few mistakes and for a number of years it was rather hard sledding. When attending one of the first farmers' institutes held in this locality I heard I. J. Clapp speak on the merits of the Guernsey cow, which caused me to decide then and there if I ever had the wherewith would own Guernseys some day. The first registered sire we had came from the I. J. Clapp estate. Later on I purchased a registered heifer from a Rosendale breeder. At present I have twenty-five pure-bred females and twenty-eight grades, all good producers, and some excellent ones in the lot. Have been doing A. R. work for two years. Among the better ones is an aged cow with an A. R. record of 13,058 pounds, 566 pounds butter fat. A two-year-old heifer at two years and four months produced 10,286 pounds milk and 529.76 pounds fat. The herd is headed by a son of Governor of the Chene. Each and every milking of all the cows is weighed and two-day samples taken and tested each month in order to know what each individual is doing.

As to our farming operations our farm has increased from an eighty to 280 acres, by purchase and acquisition. At present a little over 200 acres are tilled. There is considerable variety in character of the soil, some being heavy, stiff clay, some sandy, sandy loam, and a part rather gravelly. Something over 100 acres are sown to grain each year, mostly barley and oats, and some wheat and rye. The straw is a very important factor where considerable live stock is kept. Used as bedding it helps greatly in making large quantities of fertilizer. Being members of the agricultural experiment association led us to try the pedigreed grains, which we are much pleased with. The yield is better and prices received for seed are much better than are paid by the local buyers. Each year from forty to fifty acres of corn are planted, also considerable red clover and alfalfa each year. Practically all of the land sown to grain is seeded with red clover which usually furnishes a lot of pasture in the fall. Our milk is separated and the fresh milk fed to the calves until they are about a year old. This is an important factor in raising dairy stock.

Herewith is a likeness of most of our force. All have taken or are taking the short course at Madison, except the youngest, who is going to high school. He has charge of the poultry department. Has Rhode Island Reds, a good portion of the surplus stock being sold for breeders. The boys in the picture do not stand according to ages. They are Robert, Clarence, Harvey, Stanley and Howard. Harvey looks after the feeding of the herd and he does it very creditably.

"OUR BEST CROP," WRITES MR. JAMISON.

TEST COWS ON PASTURE.

Did You Get Your Velie Catalog?

THE 1916 Velie catalog is a beautiful book and tells all about their Biltwell Models 22 and 15, both of which are splendid cars, which have been reduced in price. You can read about some of their features in the advertisement on page 12. Then you should write for a copy of their catalog, addressing Velie Motor Co., 118 Velie Place, Moline, Ill., and mentioning this paper. Then if you can do so, a trip to their factory, not far from you, would prove instructive and interesting.—Adv.

Good Seed Corn From 1915 Crop.

GOOD seed corn from the new 1915 crop, dried in the field or on the rack, can be had of the Vermillion Seed Co., Vermillion, S. D., at reasonable prices. It will test from 90 per cent to 98 per cent and they give you plenty of time to test it before paying for it. A catalog will be sent on request to Vermillion Seed Co., Box A, Vermillion, S. D., if you will mention their advertisement on page 19.—Adv.

Whether You Build or Remodel

JAMES Barn Plan Service will start you right and keep you going right. Whether you do the work yourself or hire a builder, this service, which is a great feature of the new book, "The JAMESWAY," will be a wonderful help and profit to you. Tells what the barn owner needs to know about location, drainage, lighting, ventilation, equipping, etc. It will *save* you money and *make* you money. Written by W. D. James and his expert associates—originators of sanitary barn equipment ideas.

JAMES Sanitary Barn Equipment

in a barn built the Jamesway means bigger results with less labor. Notwithstanding its reputation and superior quality, it is reasonably priced. Stalls as low as $4.25 each. An ideal stall to begin with is the one for $5.25, with the same quality and construction of the complete feature-equipped stalls. The only difference between JAMES stalls of different prices is in some of the special features which are added to the higher-priced stalls.

The JAMES line includes Stalls, Stanchions, Pens, Carriers, Ventilators, Trucks, Watering Buckets, etc. To get a free copy of "The JAMESWAY" just fill out the coupon aud mail it at once.

Owned by Dr. Roberts
Year's Record:
580.82 lbs. Butter
12,724.50 lbs. Milk

It's Up to You When Your Cows Get "Off Feed"

It's mighty important that you do something for your cows when they are in this condition. But it's just as important to care for them when they are giving a good flow of milk. A cow should be fed to her full capacity if she is to be profitable. The strain of milk production is apt to overtax the digestive organs. The heavy milker needs a tonic to act on the secreting glands that produce the gastric juices that convert the food into milk. Dr. David Roberts' COW TONIC does that very thing. It contains such roots, barks, herbs, as nature would supply if the cow roamed the meadows and woods.

Dr. David Roberts' COW TONIC

is a great conditioner at all times, especially when cows are stabled or on dry feed. Cow Tonic is not a food, but a genuine tonic to act upon the digestive organs and enable cows to get full benefit of their food.

Breeding Tonic acts on organs of reproduction and gets animals in condition for sure breeding.

Cow Cleaner removes the afterbirth naturally. Heals and leaves breeding organs in normal condition.

Calf Cholera Remedy prevents scours and calf cholera. Keeps calves in continuous growth.

Calf Meal, Diolice, Badger Balm, Laxotonic and Stokvigor—valuable remedies, which should always be kept on hand.

Special Sample Offer
STOKVIGOR, 10c

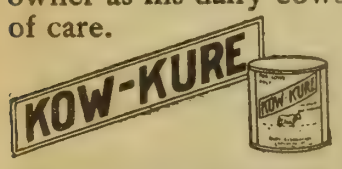
Enough to feed a cow two weeks. Aids digestion, tones the system, makes animals grow fast and develop better. Send 10c and we will send Special Sample Package to test on your own stock. Don't fail—don't wait. Enclose dime or stamps.

Get Dr. Roberts' Live Stock Prescriptions at your drug store—nearly 4000 dealers in U. S. If you do not already have the 184-page "Practical Home Veterinarian," treating all diseases of all live stock, send 25c and receive by mail, postpaid. Address

DR. DAVID ROBERTS VETERINARY CO.
950 Wisconsin Ave., Waukesha, Wis.

Why Do Dairy Cows Run Down?

No other farm animal is the cause of so much anxiety to the owner as his dairy cows; sickness gets in in spite of the best of care.



Why? Because the dairy cow is subjected to constant forcing to get the maximum in quantity and quality of the milk yield. This constant strain proves too much for many a good cow; some important function becomes impaired and for want of proper medical assistance she becomes a "backward" cow. In just such cases as these Kow-Kure has made its reputation for success when used to

Raise the Health Standard

of the herd. Kow-Kure is a medicine for cows only—not a stock food It has wonderful medicinal qualities that act on the organs of production and reproduction for the prevention or cure of many serious cow ailments. It is especially useful in cases of Abortion, Barrenness, Milk Fever, Scouring, Lost Appetite, Bunches, Retained Afterbirth, etc. Farmers who have used it keep Kow-Kure on hand constantly. Most feed dealers and druggists sell it

Sold in 50c and $1.00 Packages

OUR DAIRY DEPARTMENT

ALL communications relating to dairy matters should be addressed to this office. Inquiries of general interest regarding dairy management and production will be promptly answered.

GOOD COW-TESTING WORK.

One of the best reports on cow-testing work which has come to the attention of The Wisconsin Farmer recently is that of the Winnebago County Cow-Testing Association for the month of December. During that month 16 per cent of all the cows in the association produced more than forty pounds of butter fat, there being a total of fifty-five that produced forty pounds or more. Mr. Archibald R. House, of Omro, official tester, sends in the report and says that it is the largest report which has been made for some time, especially for December. Mr. A. L. King is secretary of the association.

Mr. House's report follows:

Owner, name and breed	Age	When fresh (1915)	Pounds milk	Per cent fat	Pounds B. fat

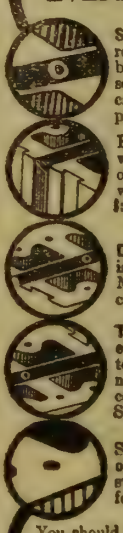
5 BIG FEATURES of the EVERLASTING SILO BLOCK



Steel cotter keys tightly secure the steel reinforcing bands to the separate silo blocks. This is the only **correct** way to secure **proper tension.** No other silo can offer this essential feature. It is patented.

Each block has deep **side corrugations,** which lock or dovetail with corrugations of blocks adjoining, when laid in the wall. This insures all joints being **absolutely air-tight.**

Double protection against heat and cold is furnished by **double air chambers.** Most other silos have only a single air chamber.

Thick triple walls afford wonderful **extra strength.** The severest wear and tear that a silo is subject to can have no effect on the scientific block used in constructing the EVERLASTING SILO.

Several small **perforations** permit **thorough burning** of the block and in construction they partially fill with mortar, forming vertical anchorage.

You should know **all** the splendid features embodied in the EVERLASTING SILO. Our illustrated catalog shows each feature in detail. Sent **free on request.**

Little Ford Milking Stool
Saves milk from spilling and keeps it clean

Every milker Needs It—Pays For Itself

Just invented and patents granted. Has all the latest features and conveniences. Big improvement over any other stool. Made of strong, durable metal, aluminum painted. Fully guaranteed. Swinging pail holder, adjustable for any size pail. Pail swings out of way if cow kicks or moves. Sliding seat gives milker four inches backward or forward movement. Collapsible—can be hung on peg when not in use. **PRICE $1.50** each. Send for circular. AGENTS, this stool sells wherever demonstrated. Write for special price.

J.A.PAUL, 903 Washington St., Waterloo, Iowa

$15.95 Upward ON TRIAL
American
FULLY GUARANTEED CREAM SEPARATOR

A SOLID PROPOSITION to send new, well made, easy running, perfect skimming separator for $15.95. Skims warm or cold milk; making heavy or light cream. Bowl is a **sanitary marvel;** easily cleaned.

ABSOLUTELY ON APPROVAL

Different from picture, which illustrates our large capacity machines. **Western orders filled from western points.** Whether dairy is large or small write for handsome free catalog. **Address:**

AMERICAN SEPARATOR CO.,
Box 4126 Bainbridge, N. Y.

Caution

Today cheap fence means very light fence. Before you buy get the lowest factory to farm prices on high carbon, open hearth, double strength, coil spring steel fence, wire heavily galvanized before woven. Our fences have been proven. We don't deceive but guarantee. Special attention to full car-load orders. Send for free catalog.

The Tiger Fence Co., 416-D Broadway, Waukesha, Wis.

Safe 6% Investment

A COUNTRY BANKER in a prosperous dairying region has for years placed funds for private investors in gilt-edged first mortgages on farm lands to net 6% and invites correspondence from persons seeking the safest investment possible, consistent with this rate of interest. Full information regarding financial standing and business record furnished. Address B, care of this paper.

When writing to advertisers please mention The Wisconsin Farmer.

Progressive Farmers

keep a binder to harvest crops at the right time, without waiting for others to do it for them when they get to it. It is just as important for you to own an Ensilage Cutter. Let us tell you why you should own a

PAPEC
PNEUMATIC
Ensilage Cutter

Cut your green fodder and pack your silo full—**at the right time.** Save the value that is lost by delay. The Papec is simple—few parts—all easy to get at. **Guaranteed** to cut and lift silage to top of **highest silo,** with **any** power, provided the cutting wheel does not fall below the moderate speed of 600 revolutions a minute.

Your engine will run it. Thousands are now successfully operated by 4 to 8 H. P. gas engines. The Papec runs at low speed, therefore uses **less power** and **lasts longer.**

Cutting blades strike heavily and make clean, regular cut along their entire length. Easily adjusted in a minute's time, and once set, **stay** set.

Six fans instead of **four** increase blowing power. Silage flows without clogging, through small pipe, in fine, steady stream--not in bunches.

Silage packs firmly as silo fills.

Send for 1916 Papec Book FREE.
Explains the many money and time-saving Papec advantages. Various sizes and new patented self-feeding device.

PAPEC MACHINE CO.
Box 71 Shortsville, N. Y.

Convenient Distributing Points throughout the U. S.

A B. V. T. Silo will be the most permanent building on your farm. Made of everlasting Brazil virtified fire clay tile. Wind, heat, cold, fire and time have no effect on a B. V. T. Silo.

Air-tight Joints in Double Wall Tile

There's no silo tile to compare with the B. V. T. It's different—a patented, exclusive design. The large, central air space (see illustration) provides abundant dead air insulation against moisture, frost and heat.

The double walls of the B. V. T. tile provide additional dead air spaces. The mortar in each joint is squeezed into ends of these narrow spaces. This absolutely seals them. It also holds mortar in place, preventing sagging and leaky joints. No other silo tile makes such an air-tight joint, which is the secret of B. V. T. success.

Reinforced with Steel

Strong, steel rods, embedded in mortar in dovetail grooves, make the B. V. T. the strongest silo in the world. Will stand three times the pressure ever put on it.

BUTTER AND BUTTER FAT.

To the Editor:—Many a creameryman has found himself "stumped" when he has attempted to explain to a patron why more pounds of butter can be made from a certain quantity of cream delivered to the creamery than the pounds of butter fat that the producer is paid for. When the creameryman visits a "backsliding" or "backslidden" patron he is very often uncourteously told that he is not giving honest tests, as more butter has been made at the farmer's or dairyman's home than was paid for the butter fat at the creamery from an equal quantity of cream.

Every person interested in dairying should have a complete and clear understanding of the difference between butter and butter fat. It is the absence of this that accounts for many a misunderstanding between him and the creamery. The producer of the cream is right when he says he can make more butter from a given quantity of cream than the number of pounds of butter fat he would be paid for at the creamery from the same cream. He is mistaken, however, when he considers the creameryman has been dishonest with him, because it is inevitable that the butter should exceed the butter fat.

Butter fat as shown by the Babcock test is practically a pure oil. There may be, and probably is, a small quantity of water or acid in the fat column in the neck of the test bottle, but we will suppose it is a pure oil, as the impurities have no material influence on the final result of the Babcock test. The butter fat is a complex oil made up of nine different fats, each having its own particular melting point. When, however, they are physically united the alloyed fats have a common melting point.

When the butter fat is in milk or cream it is in the form of minute globules, it being emulsified throughout the mass. It is then in very close physical relationship with the other components of the milk product, and without adding a sufficient amount of acid to destroy all the solids in milk —not fat—it would be practically impossible to get free from the other milk components.

When cream is churned there still remains this close relationship between the butter fat and some of the other milk components. While the butter fat becomes more united and in a solid form during the churning process, it takes up or becomes more or less closely united physically with waste and curd or casein which were in the cream. Besides these substances there is incorporated in most butter enough salt to give it the desired flavor. Butter, then, is composed of butter fat, water, curd and salt. Hence, more butter can be made from a given quantity of butter fat than the amount of original butter fat. In creamery practice an attempt is made to get about one-fifth more butter than butter fat. For instance, if 100 pounds of butter fat were in a churning an effort would be made to get about 120 pounds of butter.

The buttermaker cannot apply methods whereby he is assured of a certain increase over the butter fat, but he can secure approximate results. This increase of butter over butter fat is known as overrun. This is the factor that makes it possible for the creameryman to pay the market price of butter for the butter fat. This is a matter that has caused much discussion in creamery circles and it is one that every person at all interested in dairying should understand.

DE LAVAL

O.K'd by nearly two million cow owners

MORE De Lavals are being sold than all other makes combined—nearly 2,000,000 are now in use. Year by year an ever increasing proportion of farm separator buyers reach the conclusion that the De Laval is the only cream separator they can afford to buy or use.

In fact, about the only excuse ever offered for buying any other separator nowadays is that its first cost is a little less than the De Lavals.

But they soon find out that the last cost of a cream separator is what really counts, and when they realize that the De Laval gives the most and best service for the money they buy a De Laval.

Over 40,000 users of inferior machines discarded them for De Lavals during the past year in the United States and Canada alone.

Better be right in the first place and start with a De Laval.

C. C. SHOEMAKER, Box 897 Freeport, Ill.

POULTRY DEPARTMENT

THIS department is edited by a competent poultryman, who will be pleased to answer questions concerning disease, poultry management, etc., when they can be answered through the department. Questions will not, however, as a rule, be answered by mail, and stamps need not, therefore, be inclosed with inquiries. Address all letters relating to poultry topics to this office.

BETTER QUALITY POULTRY.

Interest in quality poultry is rapidly on the increase in Wisconsin, as evidenced by the exhibits at the sixty odd shows which were held in the state this winter. The majority of the shows, for some unknown and unaccountable reason, showed a falling off in the number of fowls shown, but what was lost in most instances in numbers was more than made up in quality, and this is encouraging, as quality is what counts in the end.

Poultry interest has always been strong in Wisconsin and we doubt if any state has more real, dyed-in-wool fanciers. The state is ideally located for poultry production, just as it is for dairying, being close to the big markets and within a night's ride of 20,000,000 of the nation's population. So it is to be expected that this industry will grow, whether the egg fancier is breeding for the show ring, the market or for egg production.

One of the outstanding features of the winter's shows was the increased interest by the farmers of the state. More farmers, we believe, had birds on display this year than ever before, for the farmer is learning that by introducing good blood into his flocks he can increase his profits, for good breeding always tells, whether for egg production or eating purposes. One drawback in the past has been that too many of our farmers have just kept poultry, while today they are beginning to see the value of establishing a good egg-laying strain and raise a breed that will produce for him when the prices are the best. Most of the show fanciers, it must be admitted, live in and adjoining the cities and towns and most of them are breeding for show purposes, but it is these fanciers that are supplying the good stock for the farmers and enabling them to increase their poultry profits. Thousands of farmers must also be classed as show bird fanciers and where they have shown this year they have succeeded in winning their share of the prize money. But the average farmer and his wife is interested in the hen for the eggs she will lay and the stress laid upon the good egg producers at this winter's shows will no doubt lead to more interest by the farmers themselves, not only in the shows, but also in the value of good breeding and laying stock.

Many of the shows in the state this winter switched from the score card to the comparison system of judging and this accounts in many instances for the decrease in the number of birds exhibited. We do not believe that a small show, one with only a few hundred birds, should try the comparison system of judging, but should stick to the score card. However, the larger shows, those with 700 or 800 birds or more, probably can do better under comparison judging, as these shows draw from a larger district and bring together more good birds than the smaller show can possibly expect. When the state show at Madison switched from score card to comparison the entries increased, as the exhibitors at this show, coming from a large area, preferred this system. However, in most cases the change occasions a decrease for a year or two, and in the case of the smaller shows it is usually found advisable to return to the scoring system or stick by it if a change has not been attempted.

Many of this winter's shows also dropped the specials for the largest displays, regardless of quality. Of course, this tended to reduce the number of entries, but at the same time increased the quality, as the exhibitors only brought their very best birds, not wishing to pay transportation and entry fees on those which could not win on quality when there was nothing offered for the largest displays. However, the prize for best displays was always contested for very keenly and this sweepstakes award proved very popular at all the shows, as it is splendid advertising for the fancier who has the best display. Consequently the fanciers work hard for this award. With the largest display award eliminated, it is not unexpected to see exhibitors bring in only a few birds when they formerly brought in a score or more, and we should not be surprised to see many of the shows which dropped this class this winter establish it again next winter in order to retain former records for number of entries.

Another innovation was carried out this year by several of the larger shows by offering big specials in certain classes if the birds in that class exceeded a certain number of entries. Instead of offering 60 per cent of the premium fee as an additional inducement if a class fills to a certain figure, offer 120 per cent, or double the extra award. This makes the breeders get out among themselves and boost to get the larger number of birds, as the winners will get a big bonus if these conditions are met. This was tried out very successfully at the Milwaukee and the Chicago shows. This means a little additional expense in premiums, but it is worth the extra cost.

The Northeastern Poultry Show, which was held recently at Green Bay, switched from the score card to the comparison this year and consequently reported a decreased number of entries. This was the seventh annual show of this association. Otto Platz, of Manawa, with his pen of S. C. White Orpingtons, won the silver cup for the best pen in the show.

The Green Bay show also offered $65 for the best displays, which brought out a good list of entries. This was won also by Otto Platz, of Manawa, but with his display of Black Orpingtons. The first prize was $30 and the second prize of $20 went to the S. C. Anconas of J. R. Meyer, of Oshkosh; third prize of $10 to the white-crested Black Polish display of A. Zehms, Jr.,

Ironclad TRADE MARK Wins in the Two BIGGEST HATCHING Contests Ever Held

Why take chances with untried machines when for only $10 we guarantee to deliver safely, all freight charges paid (East of Rockies), BOTH of these big prize winning machines fully equipped, set up ready for use? Why not own an IRONCLAD—the incubator that has for two years in succession won the **greatest hatching contest ever held?** In the last contest conducted by Missouri Valley Farmer and Nebraska Farm Journal, 2,000 Machines were entered including practically every make, style and price. With 140-egg Ironclad—the same machine we offer with Brooder freight paid, for only $10, Mrs. C. F. Merrick, Lockney, Texas, hatched 148 chicks from 148 eggs in the last contest.

140 EGG Ironclads are not covered with cheap tin or other thin metal and painted like some do to cover up poor quality of material. Ironclads are shipped in the Natural color—you can see exactly what you are getting. Don't class this big, all metal covered, dependable hatcher with cheaply constructed machines—and don't buy any incubator until you know what it is made of. Note these Ironclad specifications: Genuine California Redwood, triple walls, asbestos lining, galvanized iron covering, galvanized iron legs, large egg tray, extra deep chick nursery—hot water top heat, copper tanks and boiler, self regulator, Tycos Thermometer, glass in door, set up complete ready for use and many other special advantages fully explained in Free Catalog. Write for it TODAY or order direct from this advertisement.

R. F. NEUBERT CO., Box 806 Mankato, Minn.

of Green Bay, and fourth prize of $5 to the S. C. Rhode Island Reds shown by W. H. Laabs, of Green Bay. The birds exhibited all showed good breeding and, although the number of entries dropped down, the quality standard of this show was maintained, the officers of which are: J. M. Franssens, president; Wm. J. McGinnis, first vice-president; M. J. Laluzerne, second vice-president; L. H. Hebel, secretary; Chas. O'Connor, treasurer; Louis Tennis, warden; Henry Herbeck, director; Otto Tonne, director; Herman Holz, director; E. Van Ermen, show secretary; Louis H. Hebel, show superintendent; W. J. McGinnis, kennel superintendent. Judges: D. E. Hale, poultry; Geo. F. Ziegler and Stanley Whittaker, kennel; J. M. Franssens, pigeons.

The Southern Wisconsin Poultry Show at Janesville turned out to be the best ever held by that association from a quality standpoint, although, like all the larger shows, showed fewer birds in the coops than last year. The Janesville association puts up large cash prizes in several of the important breeds and secures a large turn-out as a result. The first national show ever held in the state was that held at Milwaukee by Theodore Hewes, who also stages the Chicago show, and this show drew a large number of Wisconsin fanciers. Being held at the same time as the Janesville and Green Bay shows, it secured many birds which otherwise would have gone to one or the other of these shows. The competition was very keen at Milwaukee and the fact that the entries were not so large as expected can only be laid to that unaccountable reason which affected the majority of the winter exhibitions. Appleton has always had a splendid reputation and the annual show there last week, in connection with the state meeting of the American Poultry Association, was not an exception.

The Fond du Lac show brought together some very good stock and the Buff Orpington display by E. L. Bemis, of that city, swept the boards, taking the grand sweepstakes award for the best display in the show. These Buff Orpingtons also took sweepstakes on display in that class.

The Eau Claire County Poultry Association at Augusta cooped 431 birds, which was ten more than a year ago. The quality was of the highest and there were about thirty exhibitors from different points. Barred Rocks were the leading class, with seventy-nine entries, and F. B. Seville, of Augusta, had the highest scoring Barred Rock in this large class. The association's sweepstakes prize of $25 cash to the highest scoring pen was awarded to C. H. Rickey, of Augusta, on Brown Leghorns. E. E. Thwing is president, F. B. Seville is secretary and George Howard is treasurer.

The Marion Poultry Association staged a very successful show at Marion with 224 birds cooped. F. S. Ludow, secretary of the show, won two of the three specials, one of his S. C. White Leghorns being placed as the best shaped male in the show and one of his White Orpingtons as the whitest bird shown. Frank Rodgers had the best shaped female, a black Wyandotte.

The Western Progressive Poultry and Pet Stock Association always hold a fine show at Sparta and the 1916 show was up to previous standard. There were thirty-five exhibitors and the birds showed good breeding. F. H. Chamberlain, of Sparta, won the specials for the highest scoring cock and pullet, with all classes competing, with S. C. Rhode Island Reds. He also had the highest scoring male in the American class. F. J. Heilman, of Sparta, with a Partridge Rock, had the best scoring cockerel of all classes; J. E. Kircheis, of La Crosse, with a Hamburg, the highest scoring hen of all classes.

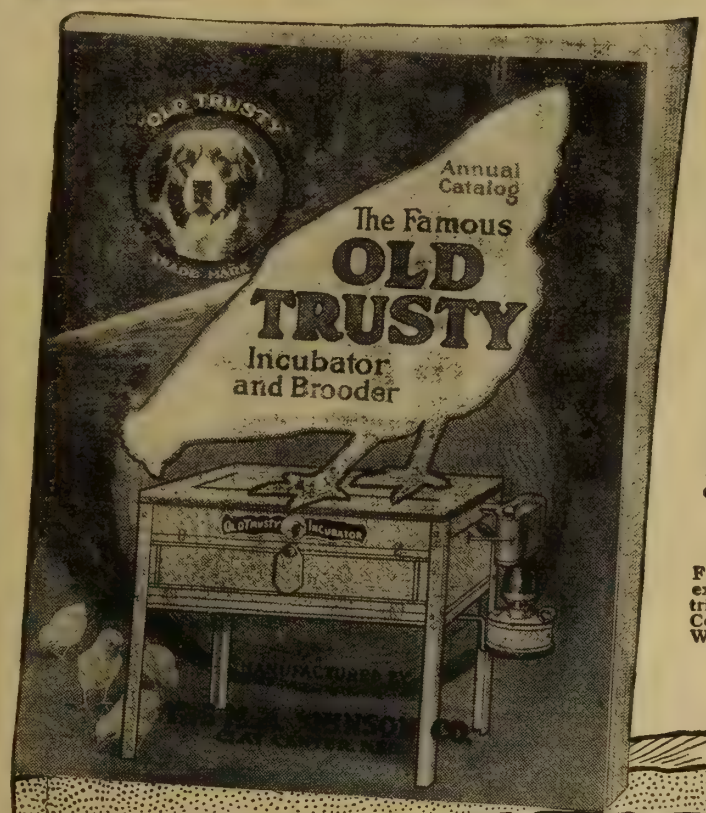
Some very high-class birds were shown at the Stevens Point show, at which S. F. Taylor, of Waupaca, with his Silver Comb White Leghorns, won the special for the best pen in the show. The awards were placed by J. G. Greenwald, of Cedarburg.

The Northwestern Wisconsin Poultry Show at Menomonie brought together the very best display of fowls ever seen in that city. The special for the best shaped bird went to a White Wyandotte cock exhibited by H. J. Penfield, of Hudson, and the best colored bird was a White Leghorn pullet shown by Oscar Hellum, of Menomonie. The White Leghorns were strongest in numbers, with forty-three birds, all bred in Dunn county. White Wyandottes and Rhode Island Reds were next in importance.

H. H. Johnson

Why **Old Trusty**

Holds the Record for Big Average Hatches



WITHOUT the galvanized metal cover and asbestos Old Trusty would still be a first-class incubator. The redwood case would still keep heat in and cold out. The fact is our first machines were built that way for years and thousands of them are still giving good service. But the asbestos and metal cover make it better just as everything else in Old Trusty is made better than the next best. Simplicity is the keynote throughout the whole machine. A simply made weatherproof case—a simple hot water heating plant that anyone can understand and operate without previous instructions. This is just one of the many reasons why Old Trusty has brought success and profits to 650,000 people. If you will

The valuable book is free. Send your name and address for it now. L. R. REEFER, 9482 Reefer Building, Kansas City, Mo.

DEPENDABLE EGGS FOR HATCHING.

To the Editor:—The hatching season will soon be here again, so let us get busy and make a good beginning. The success or failure will depend much upon the breeders selected. I never use pullets for breeders. Eggs from hens that show lots of vigor and vitality and that come through the fall molt in good condition are the desirable ones for hatching strong, healthy chicks. I have noticed that the active hen, the one that is always on the lookout for her feed, while cheerfully singing all the while, is the one that can be depended on to produce strong, fertile eggs. Of course, pullets' eggs will often hatch as well as hens' eggs, but my experience is that if they do the chicks are never as strong and do not mature as rapidly as chicks from the older hens' eggs.

The selection of the cockerel with which to head the flock is equally as important as the selection of the hens. The loud-crowing, active cockerel that is master of the situation is the one to breed from. I never use the same cockerel two years in succession.

I find that much the best results are obtained when the breeders have free range, but when this is impossible they should be given as much room as possible in which to exercise and keep them busy scratching for their food. If fowls are kept in confinement a variety of food must be fed in order to duplicate that which they can obtain when allowed free range. Wheat, oats soaked in water until soft, corn and other grains, an abundance of green food, milk and plenty of grit, with an unlimited amount of pure water will insure good hatchable eggs.

Of course, it is understood that their quarters must be kept sanitary and free from lice and mites. When the hatching is to be done with hens, large, warm, comfortable nests should be provided. These I make by placing one or two folded newspapers in the bottom of nest boxes, filling the same partly full of clean hay or straw. Dry leaves make good nesting when other material is not to be had. With good, strong, fertile eggs ready to put under the hen half the battle is won. Hens of gentle disposition, the ones that are not easily frightened, make the best sitters, and the hatching will be uniform.

Subscriber.

As a food the soy bean ranks high. In crude protein and fat it is equal to linseed or cottonseed meal, and twice as rich as wheat bran. As a concentrated food it is valuable for hogs and sheep. Its use for dairy cows should be moderate, as too large allowances of soy beans may produce soft butter. For hay and pasturage it is excellent, as a soiling crop rather unsatisfactory, as a soil renovator highly beneficial.—[Wisconsin Station.

POULTRY.

Breeding Stock From a Specialty Breeder

WE are breeders of prize-winning S. C. White Leghorns, W. P. Rocks, Barred P. Rocks, R. I. Reds, Toulouse geese, Pekin ducks. Old and young stock for sale. Also eggs for hatching. Fred H. Thiele, Specialty Breeder, Prop. Elmwood Pigeon and Poultry Farm, R. 12, N. Milwaukee, Wis.

Easier to Put Up Fits the Ground

THE "swinging joint" lets line wires swing freely with the ground. Fits hilly ground as smoothly as level stretches. This gives you a better looking fence—a longer lasting fence—and a more easily erected fence. Stays are doubly strong at every joint—strains and shocks are evenly distributed—fence keeps its shape. Save work and money fencing your farm with Apex Fence and

APEX Steel Drive Posts

Made of elastic carbon angle steel. Strong—light in weight. Cost less than wood posts set in place—last for generations. No post holes needed—you save cost of digging and tamping posts—save big share of hauling and handling. Ground the lightning and protect stock—burn fence rows clean.

Apex Posts can be driven through any soil, gravel or soft shale without injury. Replace decayed posts in old fences with Apex Posts and save the ugly job of digging holes next to standing fence.

FARM MECHANICS

Auto, Farm Engine and Farm Machinery Ailments diagnosed and remedies suggested in this department.

QUESTIONS AND ANSWERS.

Horse Power of Auto Engine.

I have bought an auto truck and I want to know the horse power of the engine. The motor is four-cylinder, three and three-fourths inch bore, five-inch stroke.

Answer.—To find the horse power multiply the square of the diameter of the cylinder by the number of cylinders and divide by two and one-half. For your motor

$$\frac{3\frac{3}{4} \times 3\frac{3}{4} \times 4}{2\frac{1}{2}} = 22\frac{1}{2}$$

Therefore your motor is 22½ H. P.

Storing a Car.

I wish to put my Ford car away for the winter. What are the proper things to drain or remove? Would it be possible to run the garage light from the Ford magneto? If so, what size lights and how many?

Answer.—Drain the radiator and gasoline tank. Jack the car up so that the tires do not touch the floor. Let the air out of the tires.

You could light two eight-volt ten-candle-power tungsten lights from your Ford magneto. Connect the lights in series.

Making a Storage Battery.

Would it cost more to make a storage battery than to buy one? How is a twenty-volt battery made? How often would it have to be recharged to run a three-candle-power light?

Answer.—It would be more satisfactory and possibly cheaper for you to buy a storage battery. A twenty-volt battery has ten cells connected in series. A six-volt, forty-ampere battery would probably answer your purpose. This battery would run a three-candle-power light for about fifty hours without recharging.

Size of Wire.

For a thirty-volt system, what size wire would be suitable for lighting four sixteen-candle-power tungsten lights? Two of the lights are in my two barns, the further one 150 yards from the generator. Would number sixteen wire be too small?

Answer.—Fire insurance rules prohibit the use of wire smaller than No. 4 for lighting purposes. You could use No. 14, but your voltage would drop from thirty at the generator to twenty-five at the furthest light. This would not be a serious loss of power, however, about five watts. Using No. 10 wire the drop would be about two volts.

A Question of License.

I wish to run an auto livery. Do I need an extra license for this? How old does a driver have to be before he can obtain a license?

Answer.—We could not give a general law as to licenses owing to the difference between the various states. For all questions regarding the license of the car write to the secretary of state in which you reside. Some states have what is known as a "dealer's license" which enables dealers to obtain one special license to cover several cars.

Chauffeur's license and license to run a livery are usually local licenses. Apply to the city clerk.

Ignition From Telephone Generator.

Does a telephone generator generate a high or a low tension current? Could it be used for ignition on a Ford auto? Could it be used for a "uni-coil" system? Would it have to be direct connected or gear driven or could it be driven by a belt?

Answer.—Telephone generators usually generate a high voltage current of small amperage. It is not suitable current for ignition and the machines are not strong enough to run continuously. A belt-driven, low-tension generator could be used with a unicoil system, but a dry cell battery or a storage battery is usually used, as the amount of current consumed is quite small.

Boiler Horse Power.

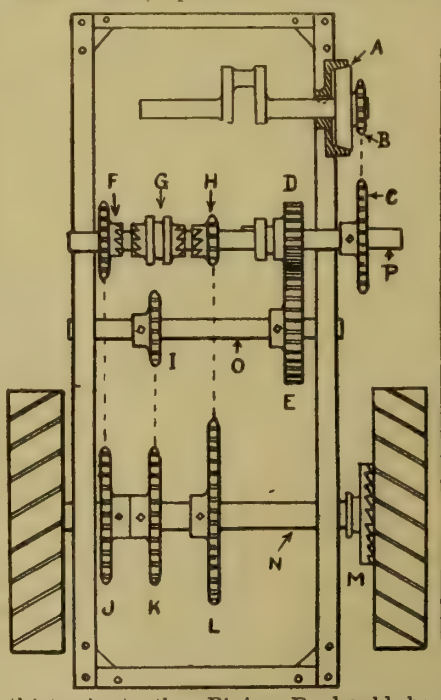
How is the horse power of a boiler calculated? How full of water should the boiler be when working?

Answer.—To find the horse power rating of a boiler divide the number of square feet of heating surface by twelve. When a boiler is working it is usually best to keep the gauge glass about two-thirds full or the water between the upper and middle gauge cocks. If the boiler "primes" badly carry a somewhat lower level. Under no circumstances should the water level become so low as to expose the crown sheet—the fire box roof. "Priming" is the carrying of water over with the steam in large quantities. It may be caused by too high a water level, bad feed water or poor boiler construction.

A Homemade Tractor.

I have a ten-horse-power gasoline engine that I wish to use for a small farm tractor. For the truck I have a manure spreader truck. The drive wheels are forty-four inches in diameter, six-inch face. They have ratchets in their hubs. To the drive axle is keyed a twenty-eight-inch sprocket wheel. The speed of the engine is 250 R. P. M. What speed will I need on the jack shaft and crank shaft to drive the tractor three miles per hour on low speed, and six miles per hour on high? For backing I have planned a second jack shaft driven by gears from the first jack shaft. Will one of the drive wheels have to be keyed to the axle in order to back the machine? I can do all the work myself except casting the gears, as I am a stationary engineer and machinist, and have a good blacksmith shop on my farm. I enclose sketch of my machine as planned.

Answer.—We publish in the figure your sketch somewhat revised. We have added the friction clutch, A, to control the drive sprocket, B. A friction clutch is necessary in order to start the tractor smoothly. Sprocket B should have twelve teeth; sprocket C should have forty-eight teeth. Sprocket F should have eighteen teeth; sprocket J should have twenty-eight teeth. Sprocket H should have twelve teeth; sprocket L should have



thirty-six teeth. Pinion D should be six inches in diameter; gear E should be twelve inches in diameter. Sprocket I should have fifteen teeth; sprocket K should have twenty-five.

The gears are shown in reverse position. To go forward slip D out of mesh with E, slip clutch, M, out of mesh with the wheel hub and the tooth clutch, G, into mesh with sprocket H. The machine is in high gear when G is engaged with F. F and H are loose on the shaft, being held in place by collars not shown on the drawing. D and G slide on the shaft, but are driven by a "feather" key in the shaft. B is keyed to the clutch. All the other gears and sprockets are keyed to the shafts.

M is a clutch to drive one of the drivers backward. On account of the ratchets in the hubs the machine could not be reversed without locking at least one wheel on the axle. If one wheel were keyed to the axle part of the differential effect of the ratchets would be lost. M must be disengaged when the tractor is running forward. At three miles per hour the drivers make twenty-three R. P. M. and the jackshaft sixty-nine R. P. M.

ONE MAN WITH A Kirstin STUMP PULLER

Quickest-Cheapest-Best Way To Clear Stump Land

The Kirstin way of land clearing is the easy, sensible, practical, economical way. Small investment to start with—no extra cost for help, because one man alone operates the Kirstin with ease, pulling out the biggest, toughest kind of stumps in less time than by any other method. With brush, hedges, small stumps, saplings, etc., you "yank 'em out" in bunches. Clear an acre from one anchor.

The "KIRSTIN" Improved Double Leverage Model

has enormous strength and power. Until you see a Kirstin at work you cannot realize what wonderful power is developed by our system of compound leverage. The work positively is easier, to say nothing of being quicker and cheaper than with the cumbersome hand power pullers or the big horse-power pullers that require a team and two or three men to operate.

Used Anywhere Hills, Swamps, Rough Ground or Thick Timber

Our Quick-Detachable Connections, Auto Release, Non-Twisting Cable and other special patented features put the Kirstin in a class by itself. Endorsed by Government and State officials. Used by the thousands all over the world. Holds record for lowest land clearing costs.

HEPSEY BURKE--A Sister to David Harum

By G. N. Wescott, the Brother of the Author of "David Harum."

(Copyright 1915.)

SYNOPSIS.

Hepsey Burke with the Junior Warden met the new pastor, Donald Maxwell, at the depot, giving him a welcome to his new parish. During the ride out to Thunder Cliff, Hepsey's home, she gave Maxwell in her outspoken way a very clear idea of the requisites or, as she put it, what the "parish wanted in the shape of a pastor." Having arrived at Thunder Cliff, Maxwell settled himself in the room assigned to him and then while resting read a letter from "Betty." However, he decided not to tell Mrs. Burke of her just yet. The new pastor's first call was upon the Senior Warden, receiving a hearty welcome from Virginia Bascom, his daughter.

CHAPTER IV.

Milking.

BETTY, my love: I can imagine just about this time you have finished your dinner and are enjoying your after-dinner coffee in the library with your father, I would give all that I possess, though heaven knows that is mighty little, to be with you and get you to talk to me and let me tell you all that has happened since I left you. But instead of that I am alone in my room with your picture on the table while I write and it is the middle of the evening with us on the farm. I have a bright wood fire on the hearth, as it's a bit chilly tonight.

Today I have almost completed my first round of parish visits and the experience has been a revelation to me of the mixture of pathetic narrowness, hardship and self-denial of the people up here in the mountains. One minute I am all out of patience with their stupidity and the next I am touched to the heart by their patience with unendurable conditions, and their generosity and kindness to each other. I hope to be able to adjust my mental equilibrium to the situation before long and to learn to understand them better; I find that a country parson must be a man of many accomplishments, and that I have to learn my profession all over again. Yesterday I called on a poor, shriveled old woman who, I was told, was in trouble. When I asked her what I could do for her she brightened up and informed me that her apple trees were full of worms! So there was nothing for it but to take off my coat and vest, roll up my sleeves and burn out the worms I must have destroyed about a bushel, more or less. It took most of the afternoon, but she was pleased and appeared in church this morning for the first time in six years.

I have learned a lot about the rotation of crops, helped to dig a well and attended a barn dance. I have eaten pickles by the score at teas given in my honor, rather than offend the hostess; and have had horrible nights in consequence. Every morning Nickey and I take the milk down to the creamery before breakfast. I am so tanned that you would hardly recognize me; and I must confess with shame that I am never more happy than when I am able to put on my soiled working clothes and do manual labor on the farm. I suppose it is the contrast to my former life, and the fact that it takes my thoughts away from the longing for you.

The men up here seem to think I know mighty little. It's very humiliating! But since they discovered that I am neither "'ristocratic" nor "pious," they seem to be friendly enough. I often find myself wondering if much of the work in the seminary wasn't a sheer waste of time, when I am brought up against the practical, commonplace, everyday life of these people. My friend, Mrs. Burke, has a fund of common sense and worldly wisdom which is worth more than any PhD. or S.T.D. represents, to help a man to meet the hard facts of life successfully, and she has been very nice and considerate in making suggestions to me—always wrapped up in a humor all her own. I have found it practically impossible to get into touch with the farmers of the neighborhood without becoming more or less of a farmer myself, and learning by actual experience what the life is like. One man was so openly supercilious when he found out that I did not know how to milk that Mrs. Burke, who is nothing if not practical, offered to show me.

I have acquired a suit of overalls and a wide-brimmed straw hat, and so, attiring myself in the most orthodox fashion Mrs. Burke and I went to the shed yesterday where Louise, the Jersey cow, abides, and I took my first lesson in milking. Mrs. Burke carefully explained to me the modus operandi I was to pursue, and so, taking the pail between my knees, I seated myself on the three-legged stool by the side of Louise and timidly began operations. She seemed to know by some bovine instinct that I was a tenderfoot, and, although I followed Mrs. Burke's instructions to the letter, no milk put in its appearance. Mrs. Burke was highly amused at my perplexity. Finally she remarked:

"You've got to introduce yourself and get Louise's confidence before she'll give down. She thinks that you are too familiar on a short acquaintance. Now talk to her a bit and be friendly."

This was somewhat of a poser, as Louise and I really have not much in common, and I was at a loss where to begin. But something had to be done and so I made a venture and remarked:

"Louise, the wind is in the south, and if it doesn't change we shall certainly have rain within three days."

This did not seem to have the desired effect. In fact, she ignored my remark in the most contemptuous fashion. Then Mrs. Burke suggested:

"Get up and come around where she can see you. No lady wants to be talked to by a gentleman that's out of sight."

So I got up and went around by her head, fed her some clover, patted her on the neck, rubbed her nose and beg n a little mild, persuasive appeal:

"Louise, I am really a man of irreproachable character. I am a son of the Revolution; I held three scholarships in Harvard; and I graduated second in my class at the General Sem. Furthermore, I'm not at all accustomed to being snubbed by ladies. Can't you make up your mind to be obliging?"

Louise sniffed at me inquiringly, gazing at me with large-eyed curiosity. Then as if in token that she had come to a favorable conclusion, she ran out her tongue and licked my hand. When I resumed operations the milk poured into the pail and Mrs. Burke was just congratulating me on my complete success when, by some accident the stool slipped and I fell over backwards and the whole contents of the pail was poured on the ground. My! but wasn't I disgusted? I thought Mrs. Burke would never stop laughing at me, but she was good enough not to allude to the loss of the milk!

Some day when we are married and you come up here I will take you out and introduce you to Louise and she will fall in love with you on the spot.

My most difficult task is Senior Warden—and it looks as if he would not make friends, do what I will to "qualify" according to his own expressed notions of what a country parson should be. But I rather suspect that he likes to keep the scepter in his own hands, while the clergy do his bidding. But that won't do for me.

So you see the life up here is interesting from its very novelty, though I do get horribly lonesome sometimes. If I had not pledged myself to the Bishop to stay and work the parish together into something like an organization I am afraid I should be tempted to cut and run—back to you, sweetheart.

And there was a postscript:

I've not said half enough of how much Mrs. Burke's wisdom has taught and helped me. She is a shrewd observer of human motives and I expect she has had a struggle to keep the sweetness of her nature at the top. She is, naturally, a capable, dominating character, and often I watch how she forces herself to let persuasiveness take precedence of combativeness. Her acquired philosophy, as applied to herself and others, is summed up in a saying she let drop the other day, modified to suit her needs: "More flies are caught with molasses than with vinegar—but keep some vinegar by you!". Verb. Sap!

CHAPTER V.

The Miniature.

IT HAPPENED that the Reverend Maxwell committed a careless indiscretion. When he went to his room to prepare for supper he found that he had left the miniature of a certain young lady on the mantelpiece, having forgotten to return it to its hiding place the night before. He quickly placed it in its covering and locked it up in his desk, but not without many misgivings at the thought that Mrs. Burke had probably discovered it when she put his room in order.

He was quite right in his surmise, for just as she was about to leave the room she had caught sight of the picture, and, after examining it carefully, she had exclaimed to herself:

"Hm! Hm! So that's the young woman, is it? In a gilded frame set with real glass rubies and turquoises. I guessed those letters couldn't come from his mother. She wouldn't write to him every blessed day; she'd take a day off now and then, just to rest up a bit. Well, well, well! So this is what you're dreaming about; and a mighty good thing, too—only the sooner it's known the better. But I suppose I'll have to wait for his reverence to inform me officially, and then I'll have to look mighty surprised! She's got a good face, anyway, but he ought to wait awhile. Poor soul! she'd just die of loneliness up here. Well, I suppose it'll be my business to look after her and I reckon I'd best take time by the fetlock and get the rectory in order. It isn't fit for rats to live in now."

Mrs. Burke's discovery haunted her all day long and absorbed her thoughts when she went to bed. If Maxwell was really engaged to be married she did not see why he did not announce the fact and have it over with. She had to repeat her prayers three times before she could keep the girl in the gilt frame out of them, and she solved the problem by praying that she might not make a fool of herself.

The next morning she went over to Jonathan Jackson's house to see what her friend and neighbor, the Junior Warden, would say about the matter. He could be trusted to keep silent and assist her to carry out some provisional plans. She knew exactly what she wished and what she intended to do, but she imagined that she wanted the pleasure of hearing

The Door Opens to You

Operator Installer Lineman Clerk

The Picked Army of the Telephone

The whole telephone-using public is interested in the army of telephone employees—what kind of people are they, how are they selected and trained, how are they housed and equipped, and are they well paid and loyal.

Ten billion messages a year are handled by the organization of the Bell System, and the task is entrusted to an army of 160,000 loyal men and women.

No one of these messages can be put through by an individual employee. In every case there must be the complete telephone machine or system in working order with every manager, engineer, clerk, operator, lineman and installer co-operating with one another and with the public.

The Bell System has attracted the brightest, most capable people for each branch of work. The training is thorough and the worker must be specially fitted for his position.

Workrooms are healthful and attractive, every possible mechanical device being provided to promote efficiency, speed and comfort.

Good wages, an opportunity for advancement and prompt recognition of merit are the rule throughout the Bell System.

An ample reserve fund is set aside for pensions, accident and sick benefits and insurance for employees, both men and women. "Few if any industries," reports the Department of Commerce and Labor, "present so much or such widely distributed, intelligent care for the health and welfare of their women workers as is found among the telephone companies."

These are some of the reasons why Bell telephone service is the best in the world.

someone tell her that she was exactly right.

Jonathan Jackson was precisely the person to satisfy the demand, as his deceased wife had never allowed him to have any opinion for more than fifteen minutes at a time—if it was different from hers, and when she had made a pretense of consulting him he had learned by long experience to hesitate for a moment, look judicially wise and then repeat her suggestions as nearly as he could remember them. So Jonathan made a most excellent friend and neighbor when any crisis or emergency called for an expert opinion.

Mrs. Burke had been an intimate friend of Sarah Jackson, and just before Mrs. Jackson died she made Hepsey promise that after she was gone she would keep a friendly eye on Jonathan and see that he did not get into mischief, or let the house run down or "live just by eatin' odds and ends off the pantry shelf any old way." Mrs. Jackson entertained no illusions in regard to her husband and she trusted Hepsey implicitly. So, after Mrs. Jackson's mortal departure, Hepsey made periodic calls on Jonathan, which always gave him much pleasure until she became inquisitive about his methods of housekeeping; then he would grow reticent.

"Good morning, Jonathan," Hepsey called, as she presented herself at the woodshed door, where she caught Jonathan mending some of his underclothes laboriously.

"Well, I declare," she continued, "I'm blessed if you ain't sewin' white buttons on with black thread. Is anybody dead in the family or ain't you feelin' well as to your head this mornin'?"

His voice quavered with mingled embarrassment and resentment as he replied:

"What difference does it make, Hepsey? It don't make no difference, so long as nobody don't see it but me."

"And why in the name of conscience don't you get a thimble, Jonathan? The idea of your stickin' the needle in and then pressin' it against the chair to make it go through. If that ain't just like a helpless man, I wouldn't say.'

"Well, of course, sewin' ain't just a man's business, anyway, and when he has just got to do it——"

"Why don't you let Mary McGuire do it for you? You pay her enough, certainly, to keep you from becomin' a buttonless orphan."

Mary McGuire, be it said, was the woman who came in by the day and cooked for Jonathan and intermittently cleaned him out of house and home.

"She don't know much about such things," replied Jonathan confidentially. "I did let her do it for a while, but when my button holes got tore larger, instead of sewin' 'em up, she just put on a larger button, and I'd be buttonin' my pants with the covers of saucepans by now if I'd let her go on."

"It is curious what helpless critters men are, specially widowers. Now, Jonathan, why don't you lay aside your sewin' and invite me into your parlor? You aren't a bit polite."

"Well, come along then, Hepsey, but the parlor ain't just in apple-pie order, as you might say. Things are mussed up a bit." He looked at her suspiciously.

When they entered the parlor Mrs. Burke gazed about in a critical sort of way.

"Jonathan Jackson, if you don't get married again before long I don't know what'll become of you," she remarked, as she wrote her name with the end of her finger in the dust on the center table. "Why don't you open the parlor occasionally and let the air in? It smells that musty in here I feel as if I was attendin' your wife's funeral all over again."

"Well, of course, you know we never did use the parlor much, 'cept there was a funeral in the family or you called or things like that."

"Thank you, but even so, you might put things away occasionally and not leave them scattered over the place."

"What's the use? I never can find auything when it's where it belongs, but if it's left where I drop it I know right where it is when I want it."

"That's a man's argument. Sakes alive! The least you could do would be to shut your bureau drawers."

"What's the use shuttin' bureau drawers when you've got to open 'em again 'fore long?" Jonathan asked. "It just makes so much more trouble and there's trouble enough in this world, anyway."

"You wouldn't dare let things go like this when Sarah was livin'."

"No," Jonathan replied sadly, "but there's some advantages in bein' a widower. Of course, I don't mean no disrespect to Sarah, but opinions will differ about some things. She'd never let me go up the front stairs without takin' my boots off, so as not to soil the carpet, and when she died and the relatives tramped up and down reckless like I almost felt as if it was wicked. For a fact, I did."

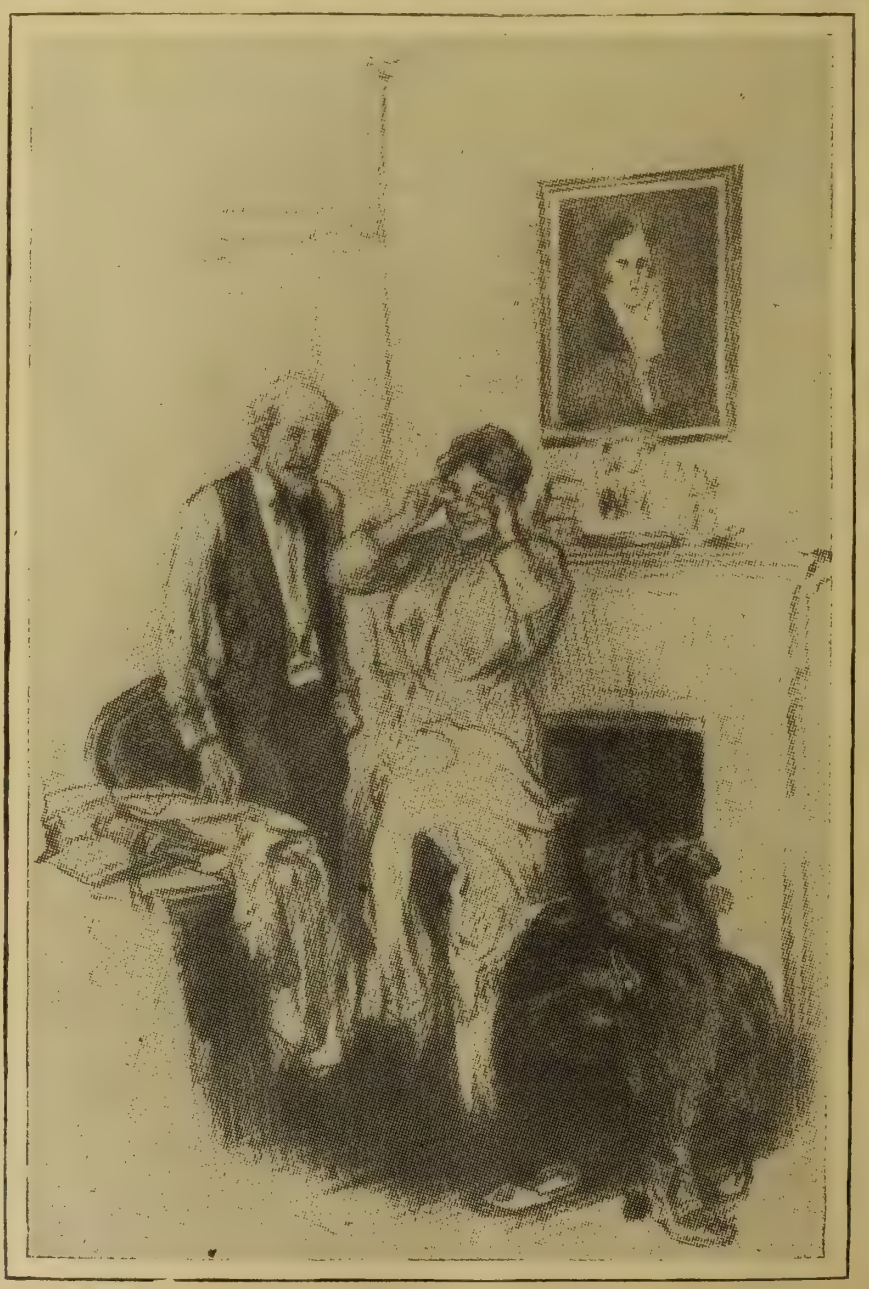
"Well, I always told Sarah she was a slave to dust; I believe that dust worried her a lot more than her conscience, poor soul. I should think that Mary McGuire would tidy up for you a little bit once in a while."

"Well, Mary does the best she knows how. But I like her goin' better than comin'. The fact is, a man of my age can't live alone always, Hepsey. It's a change to live this way, till——"

"Oh, heaven save the mark! I can't stay here talkin' all day, but I'll tidy up a bit before I go, if you don't mind, Jonathan. You go on with what you call your sewin'."

"Go ahead, Hepsey. You can do anything you like," he replied, beaming upon her.

(To be continued.)



"I'M BLESSED IF YOU AIN'T SEWIN' WHITE BUTTONS ON WITH BLACK THREAD. IS ANYBODY DEAD IN THE FAMILY, OR AIN'T YOU FEELIN' WELL THIS MORNIN'?"

The "Easy-Opener" Works Smoothly

The drawing is about half-size. When you get a knife, get a good one. To get this one, read our offer and act upon it at once.

Sonny---

Here's a real knife; a knife you'll brand a "beaut" the minute you see it.

Whether it's mumble-peg, "whittlin,'' or the thousand and one uses you have for a knife, this Easy-Opener will always "deliver the goods." The blades are of Sheffield steel, hardened in oil and uniformly tempered.

To every person sending us $1.00 for the FAMOUS DOLLAR TRIO, (The Housewife, regularly 50c; McCall's with pattern, regularly 50c, and People's Home Journal, regularly 50c each for one year) will be sent an Easy-Opener Knife, postpaid.

Double Value In Our Offer---

The Housewife	$ .50
McCall's and pattern	.50
People's Home Journal	.50
Easy-Opener Knife	.50
Value	$2.00

You Send But One Dollar

Knife and magazines will be sent to different persons if desired.

BOYS—Get daddy or mother to subscribe. They will enjoy the magazines and you will enjoy possession of such a knife.

PARENTS—Why not take advantage of this offer? You get the big magazine value and the boy will be delighted with the knife.

THE EMERGENCY SHELF.

Do you have an emergency shelf? Are you one of those efficient housekeepers who, at a moment's notice, can go to the larder and in a few minutes set before the unexpected guest a regular "company dinner?"

Most of us are not so fortunate. Of course, those who live in the country and have plenty of milk, cream, butter and eggs find it easy to prepare many delicious dishes in short order. Cream soups, custards, souffles and omelets are good hurry-up dishes. A salad dressing of sour cream can be quickly prepared for a dressing of cabbage or any vegetable at hand, or halves of pears and peaches with chopped nuts served with a boiled salad dressing make a most delicious salad.

Nevertheless, the emergency shelf is a good thing to have, especially in the small town or country home where the telephone may not bring the desired article on short order. The thoughtful housewife will stock her shelf with the foods, accessories and relishes that are especially adapted to her needs. It should contain a few cans of fish (salmon and tuna) which may be served plain or in combination with other foods, cans of vegetables like corn, peas and beans, cans of soup of various kinds, olives, pickles, a jar of salad dressing, a bottle of nutmeats, jellies, jams and preserves. Salt wafers kept in a tin box and two or three kinds of cookies stored in air-tight jars will keep for a long time.

With such a shelf one need never be caught unprepared—but don't forget to replace whatever you use at the very first opportunity. Also, the wise woman will have a list of easily prepared dishes to which she may turn in a hurry, for sometimes the best trained minds are flurried when unexpected company arrives.

NEED OF MOTHER TRAINING.

Many untrained individuals have wrong ideas concerning what constitutes proper care of children. They are liable to go to one of two extremes. Either they are overindulgent or they are too severe. The one disregards all rules of hygiene and refuses to conform to any regulations "because the baby does not want it." The undeveloped child is allowed to eat and sleep when it pleases, to follow its own caprice in all matters without regard to the effect upon its health or without consideration for the remainder of the family. The other extremist is overanxious concerning every detail of the child's life.

The overwatched child is not allowed to drink one drop more than the rules prescribe. A variation of a few minutes in its hours of sleeping is watched with concern. The baby is wrapped and toasted and kept so like a hothouse flower that it does not develop any power of resistance. One of these extremes is as bad as the other.

A great deal of judgment and common sense, with a foundation of knowledge, is necessary for the proper care of babies. It sometimes is a matter of surprise that young mothers do not make more mistakes, considering their lack of training and experience. In no other line of work do we throw such great responsibilities upon the untrained worker. It is strange that in our great system of public education no provision is made to train girls for their great work in life. There is no reason why the proper care of babies should not be a required study in school. It certainly would be of much more practical and economic benefit in later life than many of the subjects that now are required.

The present-day mothers who realize how handicapped they are by lack of knowledge of babies should insist that their daughters do not suffer from the same lack. Whatever the mothers of the country demand shall be taught in the schools will be placed in the curriculum.—[Dr. E. B. Lowry, in "Your Baby."

FOURTH PRIZE STATE FAIR BABY.

To the Editor:—I am sending you a picture of our baby girl, Esther May, twenty months old. She has never been sick and has a glorious appetite. She is fed four times a day, always at a given time, so is always ready for her meals. We feed her mostly on milk, cereals and eggs and fresh water to drink whenever she wants it.

Her clothing is the simplest kind, all made to hang from the shoulders.

For the benefit of other busy farm mothers I will tell how we kept her out of doors last summer and fall

ESTHER MAY SHANANDER, PRIZE WINNER AT IOWA STATE FAIR.

without interfering with my work. We used a clean, smooth dry goods box, four feet by four, and just high enough so that whenever she stood up she could rest her arms on it without falling out. Then we put a rug in the bottom and some playthings and placed the box in the shade—and she was safe and satisfied. She spent the greater part of the day there, except when she took her nap after dinner.

We took her to the state fair in Des Moines, where she won fourth prize in the rural baby class, with a total of ninety-five. Mrs. Wm. Shanander.

SOMETHING FOR YOU TO THINK ABOUT.

The bureau of education says that there are in the United States 20,000,000 school children. Over 12,000,000 (60 per cent) of these children are attending 250,000 rural schools. The country schoolhouse is the worst, the most unsanitary and inadequate type of building in the whole country, including not only buildings for human beings but also those used for our live stock.

Rural school children are less healthy and are handicapped by more physical defects than are the children of the cities, including even the children of the slums.

Healthful and attractive rural schools are absolutely essential to the physical, mental, social, economic and moral well-being of the children themselves, and to the life and welfare of the nation as a whole.

Country school children should have as sanitary and attractive schools and as intelligent and effective health care as school children in the cities.

The health care of rural school children should include at the least the following:

Schoolhouses sanitary and attractive, well ventilated, lighted, cleaned and equipped within and without.

Teachers better trained and better paid to do their logical and full share in carrying out a health program.

Health examinations, including dental inspection, once a year.

Follow-up health work by district and school nurses.

Health care in the school, including health instruction, warm school lunches, tooth brush drills and inculcation of all health habits.

Provision for removal of injurious defects by dental clinics, health clinics, etc.

Co-operation of all available individuals and organizations for the promotion of health and welfare of country school children.

Country children deserve as much health and happiness as city children.

Country children are entitled to as careful cultivation as live stock and crops.

A HOMEMADE FIRELESS COOKER.

A number of our subscribers have asked for information concerning the making of a homemade fireless cooker. A very satisfactory one can be made from two lard cans, a fifty-pound can and a twenty-five-pound can.

In the bottom of the larger can place two inches of paper pulp made by tearing newspapers into shreds and soaking them in water. The padding should be firmly stamped down and the smaller can placed upon this. Then fill the space between the two cans with the pulp, taking care to pack it tightly. The padding should extend to within one inch of the top of the smaller can, allowing only enough space to fit the lid. A half-gallon granite or aluminum kettle can be used for the cooking vessel.

The food is brought to a boil in the vessel, then it is covered and placed in the cooker as quickly as possible. The lid of the smaller can is placed in position. Several thicknesses of cloth then go in and the whole is coverad by the lid of the larger can.

HOW TO SEW ON A HOOK AND EYE.

Next to an unsightly buttonhole, the slovenly hook and eye does about as much damage to the looks of a garment as anything one can mention. It is really an art to sew on a hook and eye so that they will fulfill the mission for which they were invented and at the same time stay modestly out of sight.

The hook should be placed on the right side just far enough back from the edge to prevent it showing. Tack with small stitches to hold in place while the buttonhole stitch (purl on outside) is being put in to cover the loops. The hook end should be fastened firmly with tacking stitches.

The eye must be on the left side exactly opposite the corresponding hook. In order to be accurate about this, after the hooks are sewed on, place the edges of the garment in position and stick pins where the eyes are to be. Sew on eyes, also with buttonhole stitch.

The thread should match the material in color, thus making the fastenings less conspicuous.

This method holds them on so firmly that one is well repaid for the extra time required in the beginning.

When putting fastenings on plackets begin at the apex—on waists and corset covers begin at the top. Place them close enough to prevent gaping. No garment should ever be pinned.

FOR THE HOUSEWIFE.

In cooking fruit it takes nearly twice as much sugar to sweeten it if added before cooking. Cook first, then sweeten to taste.

The ravelled threads from old linen will be found best for darning tablecloths or napkins.

Put white washable skirts onto their stiff inside belts by means of a strip of snappers and there will be no belts crumpled and ruined in the washing.

Tea and coffee stains may be removed by pouring boiling water over them or by the use of oxalic acid. Chocolate and cocoa stains are washed with soap and tepid water to remove them.

Most cooked cereals are good with dates stirred into them and the whole served with cream. The dates should first be well washed, dried, stoned and chopped.

Flavor a rich cream sauce with some good meat sauce and poach some eggs in it. Serve on toast for breakfast or luncheon.

A tablespoonful of melted butter added to a quart of pancake batter makes greasing the griddle unnecessary; hence no smoke or odor.

To keep cheese moist and fresh, put in glass jar, screw top on tight and set away in a cool place.

If you haven't a funnel handy when

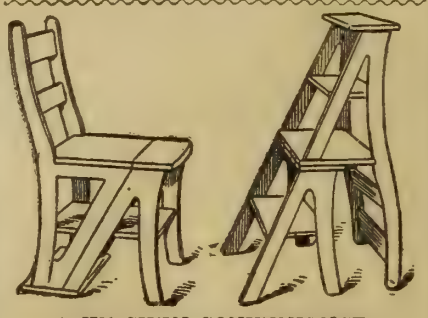
you fill salt and pepper boxes an envelope with the corner cut off will do.

It is poor economy to buy cheap blankets. An all-wool blanket not only outwears the cheaper one, but is much warmer.

If the children's hands are badly chapped wash them gently and carefully in warm water and castile soap, then rub with cold cream or white vaseline and pull on a pair of white kid mitts made from the tops of old gloves. Let them wear the mitts all night and replace them with colored ones for daytime if need be.

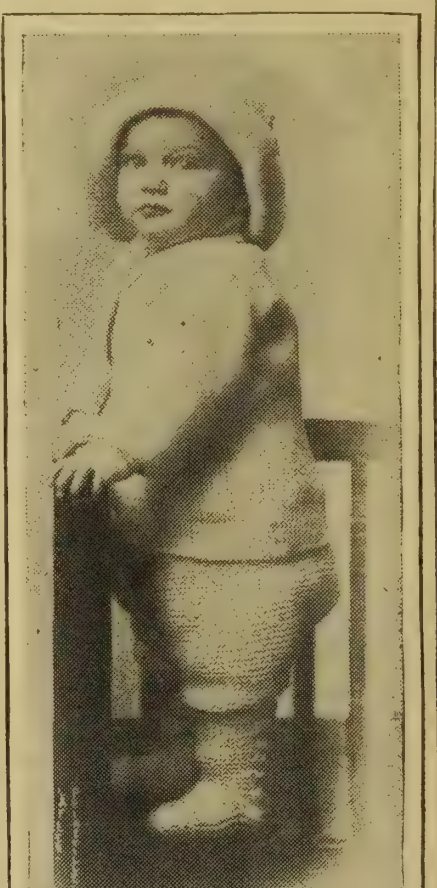


A KITCHEN CONVENIENCE.

A stepladder chair will be found most useful in the kitchen. One can be had at a cost of $1.50 and the expenditure is small in comparison with the comfort and convenience derived from its use.

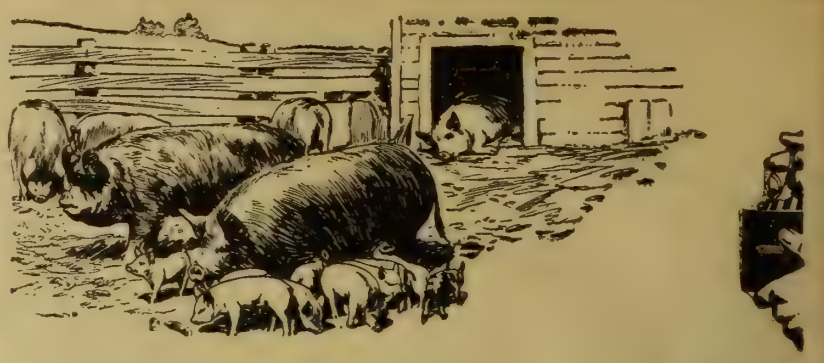
RECIPES.

Cabbage Rolls.—One cup of cold, cooked meat of any kind, chopped fine, one-third cup of cold, cooked rice, salt to taste, a sprinkling of pepper and one heaping tablespoonful of bacon drippings. Mix these together very thoroughly. Remove the leaves from a head of firm, white cabbage. Place in the center of each cabbage leaf one tablespoonful of the mixture. Roll up carefully and tie in place with a cord or fasten together with toothpicks. Pack closely in a steamer and steam



JOHN SMITH, SON OF DR. AND MRS. C. E. SMITH.

Little John is the first osteopathic baby to come to our columns. All his baby aches and pains have been massaged away by his doctor father and from appearances John has thrived on the treatment. He is thirteen months old and, according to his parents, a happy, healthy youngster—his solemnity, we suspect, being merely assumed for the occasion.



In every nook and corner of the farm, inside and outside of every building, in every field and at every turn of the lane there's a picture that should form a part of your

KODAK RECORD

Such pictures add interest and *value* to your written record. The making of Kodak pictures is very simple, and is less expensive than you think.

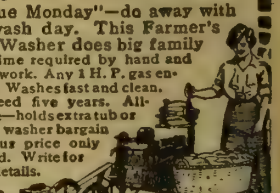
G. & D. Mfg. Co.
4 Iowa Avenue
STREATOR, ILLINOIS



30 Days Free Trial

for half to three-quarters of an hour. Turn out on hot platter, remove the fastenings and serve immediately.

Honey Muffins.—One pint of flour, two teaspoonfuls of baking powder, one-half teaspoonful of salt, sifted four times; yolks of two eggs beaten lightly, one and one-fourth cupfuls of cream. Beat thoroughly, then fold in lightly the beaten whites of two eggs and two tablespoonfuls of extracted honey. Bake in muffin pans and serve while hot.

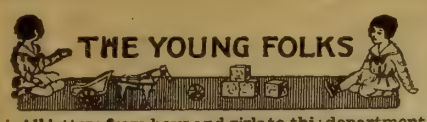
Stuffed Potatoes.—A nice way to vary baked potatoes is to cut a slice from the top of each and scrape out the inside. Mash, season with salt, pepper, chopped parsley and butter, and heat in a little hot milk. Add two well-beaten whites of eggs. Refill the skins, sprinkle with grated cheese and place in a hot oven for about six minutes.

Cranberry Frappe.—Wash and pick over a quart of cranberries. Put into a saucepan with two cups of boiling water and boil five minutes. Mash and boil ten minutes (without a cover); then add three cupfuls of sugar and boil five minutes. Strain, cool and freeze the same as ice.

Apple gems.—Chop four sour apples fine, add one beaten egg, two tablespoonfuls molasses, one and one-half cups Indian corn meal, one and one-half cups flour, one-half teaspoonful salt, two teaspoonfuls baking powder. Add sufficient milk to make thick drop batter; bake in hot, greased gem pans.

Potted Meat.—One-half-pound of veal shank, one-half pound beef shank, one-half pounds pork shank. Boil in plenty of water till tender. Grind in meat grinder. Let liquor cool, remove all fat, and add meat. Heat together. Season with salt and pepper. Pack in porcelain pan and when cool it will slice easily. This is nice with chicken in place of veal.—Mrs. H. H.

Sugar Cookies.—Two cupfuls sugar, two eggs, one cupful lard, one-half cupful sour milk, one teaspoonful soda, two teaspoonfuls baking powder, four cupfuls flour. Flavor with lemon and nutmeg. Mix very soft, roll in flour and sugar mixed together.—M. C.



All letters from boys and girls to this department should be sent to office of The Wisconsin Farmer, Madison, Wisconsin.

THE WIND.

I saw you toss the kites on high
And blow the birds about the sky;
And all around I heard you pass,
Like ladies' skirts across the grass—
O wind, a-blowing all day long,
O wind, that sings so loud a song!

I saw the different things you did,
But always you yourself you hid.
I felt you push, I heard you call,
I could not see yourself at all—
O wind, a-blowing all day long,
O wind, that sings so loud a song!

O you that are so strong and cold
O blower, are you young or old?
Are you a beast of field and tree
Or just a stronger child than me?
O wind, a-blowing all day long,
O wind, that sings so loud a song!
—Robert Louis Stevenson.

THE LEGEND OF ST. VALENTINE.

Every little girl and every little boy, we suppose, is thinking of valentines these days, and planning to send to some other little girl or boy the very prettiest one to be had. It is a pretty custom and I wonder how many of you know how it first came about?

It happened this way. A long time ago, in Rome, during the reign of Emperor Claudius II—you ancient history students know about him—there lived a good man named Valentine. This man Valentine was a Christian and he loved to tell the people, many of whom could not read or write, about God and His goodness. And the people loved Valentine and became Christians too because they believed what he told them.

But Claudius II was not a Christian and he hated Valentine and all others who were Christians, so he put many of them in prison. Valentine was not afraid of the emperor and went right on preaching and helping those who were in prison. This made Claudius

so angry that he put Valentine in a dungeon and put a guard over him. But did Valentine get discouraged and give up? Not a bit of it. He just talked to his guard and the first thing Claudius knew the guard had been converted too and had gone away to tell others of the wonderful news.

This made the emperor more angry than ever, and in retaliation he had Valentine beaten and beheaded. That shows how much Valentine loved the truth and God, for he gave up his life so that he might teach others. But the people he had converted loved him and believed what he had believed, so they called him Saint Valentine because he had always been so good, and they vowed they would always remember the day of his death—February 14th.

At this same time of the year there was a celebration in Rome in honor of heathen gods. They called this festival Lupercalia. The names of girls were put in a box and the young men each drew out a name, and it was the custom that the maiden whose name he drew was to be his sweetheart.

Now, this custom did not please the early Christians so they put the names of saints in the box instead of the maidens' names, and then all the young folks, both girls and boys, drew out a name and each was supposed to honor the saint whose name he drew.

The festival began about the middle of February and so the people chose Valentine as the patron saint of the festival. It was in this way that the day lost its former pagan form and became a religious festival.

Then, after a while, they stopped celebrating the day in a religious way but the young folks didn't forget it and sent their messages on February 14th just the same. They didn't have postmen then so they sent their messages or valentines by carrier pigeons.

Now when someone sends you a pretty valentine with flowers and hearts and doves and maybe a cunning Cupid on it you will remember how the custom started and will not forget the good Saint Valentine who loved others so much that he gave up his life teaching them the truth.

LIKES THE COLD COUNTRY BEST.

Dear Young Folks:—I have a friend, our neighbor's boy, who often tells us stories about himself. He is eleven years old. Maybe some children in the northern or cold countries think they do not like the cold weather and would rather be in warm countries. Here is what this boy says about it:

I was born in Russia and came to America when I was about one year old. I do not remember how I liked it in Russia and I cannot tell anything about crossing the ocean. All I remember is just being in Wisconsin near a little river and near a village. I went to school after I got big enough and was happy playing by the river.

During that time my father worked in mills and other places. When I was nine years old all our family moved to Lodi, California. On the way I saw many different places, and mountains and rivers and people. When we got to California I saw many different fruits growing, such as grapes and bananas and oranges, but I soon got tired of the fruit. I also saw how the grapes were put in the cars and how the fruit was gathered.

I went to school, but we played different games than we did in Wisconsin. It was very warm there and the people did not need furnaces or heaters. The houses are built different—only of single boards, with just a good roof to prevent the rain coming in, and it very seldom rains. When the winter came there was no snow and it never got cold enough to freeze the water, so could not use my sled or skates.

After a few months we decided to come back to Wisconsin. Many people came to us and told us to stay longer. The pastor of one of the churches said to me, "You better tell your father to stay here, because if you go back to Wisconsin your father will have to get you a warm coat and yet you will be cold." And I said, "If I go back to Wisconsin there will be snow and ice, and I will play with snow balls and slide on my sled and skate on the ice. That will be more fun than here."

The pastor smiled and said, "All people are not alike; some are thankful to God for warmth and others are thankful for ice and snow."

When we came back to Wisconsin it was almost spring, but I enjoyed it better here playing in the snow.

This boy now lives on a farm and goes to school with us and he says he never wants to live in the warm climates. —Alice.

FUZZY ANN AND TOODLES.

Dear Young Folks:—I have been reading your letters and thought I would write and tell about myself.

I had never been in the country until we moved out here two months ago, so you can about imagine how interesting everything is to me. We have twenty-seven cows and four calves that were born last week. The calves are the cutest little things I ever saw—all black and white. We also have four big horses and some chickens.

I have a Maltese cat named Fuzzy Ann and she is very playful. She plays with Toodles, our dog. One day while playing the dog accidentally bit her little gray ear, and that made her real mad, so she scratched his nose and made it bleed. It is well now, but he is more careful how he handles her. It is very sweet to see him pick her up by the neck and carry her around. I must tell you more about them if you are not getting tired.

One morning when we came out the ground was covered with snow. Fuzzy Ann was afraid of getting wet so Toodles took her by the neck and put her in the deepest snow and left her there. Then he stood looking at her and enjoying her discomfort I think, but he soon felt sorry for her and went and got her and took her to the barn. I thought that was so cute I wanted to tell you about it.
—Lillian.

The first thing to remember in tea making is not to boil it, for this takes out the flavor and aroma that constitute its nourishment. Always use freshly drawn water and let it boil until it bubbles furiously. Scald an earthenware vessel with boiling water and while it is still warm put in one full teaspoonful of tea for every two cups. Pour the bubbling water over it and set the vessel on the back of the stove. Let the tea steep for five minutes, then pour it into a heated teapot and serve.

SUGAR 2½c PER LB.

Here is the List of Groceries You Get

20 Lbs. Granulated Sugar	$ .50
1 lb. Coffee (unground)	.25

In order to introduce **THE PEOPLE'S HOME JOURNAL** into 100,000 new homes by April 1st, next, we have decided to accept for a limited time only a six months' trial subscription for 25 cents and give free four Beautiful Silk Flag Post Cards. The subscriber may select any four of the flags of the Nations listed below. We do not sell the Flag Cards; they can be obtained only for a trial subscription to **THE PEOPLE'S HOME JOURNAL**, America's foremost Fiction and Household magazine.

Once a subscriber always a subscriber. That's why we make this liberal offer. We know if you send a trial subscription you will like the magazine so well that you will renew from year to year as hundreds of thousands of others have done.

The International Series of Silk Flag Post Cards

The Very Latest Fad

Flags of All the Foremost Nations

These flags are in beautiful colors and are made of silk. A special feature is the wavy effect of the silk, as though the flags were blown by the breeze. Each flag is a true representation of the official flag of each nation and is printed with suitable national inscription in the mother tongue of the nation the flag represents.

The decorations and flag staff are in gold; the flags are of silk, mounted on handsome cards, 3½x5½ inches. The reverse side of the card is printed in the regular post card way, so that you may send them through the mail—a handsome souvenir post card.

Start a Collection

These Silk Flags of all Nations are entertaining, historical and educating. This is a list of flags we can furnish.

International Sunday School Lesson

Lesson for February 13, 1916
(By E. O. SELLERS, Acting Director of Sunday School Course.)

HUMBLED AND EXALTED.

LESSON TEXT—Phil. 2:1-11.

GOLDEN TEXT—For ye know the grace of our Lord Jesus Christ, that though he was rich, yet for your sakes he became poor, that ye through his poverty might become rich.—II Cor. 8:9.

The key word of the first chapter of Philippians is "confidence" (See vv. 6, 14, 25). Paul has confidence in the church at Philippi on account of their spiritual condition (vv. 1, 2), which resulted in fellowship (vv. 3-8) and fruitfulness (vv. 9-13). This confidence inspires boldness and is a source of joy and blessing. Paul's creed is also set forth in Chapter 1:5-11. This confidence is in the face of the conflict and suffering which was before them (See 1:27-30).

I. Be of the Same Mind, vv. 1-4. The key word of this chapter is the word "comfort" (vv. 1, 19). The first section might be entitled "The Comfort of Love" (vv. 1-18) and the second section "The Comfort of Knowledge" (vv. 19-30). If there was to be opposition from without certainly the Christians ought to stand together. Paul is urging them to unity in order that it might comfort and console him. He had always rejoiced in this church (1:4), but he desires them to "fill full his joy by being of the same mind, having the same love, being of one accord, of one mind." Paul's comfort of love in the disciples he anticipated would be due to their state of mind, which depended upon (a) unity (vv. 1, 2); (b) humility (v. 3); (c) that they might "mind the things of others" (v. 4). Nothing would so comfort and console, or so gladden the heart of Paul as such unity. It was even so with the heart of our Lord (See John 17:21). The words "be of the same mind" do not refer merely to unity of opinion, but rather to a unity of purpose and affection, literally "being souled together."

II. Let This Mind * * * Which Was Also in Christ Jesus, vv. 5-8. The second comfort of love was due, not to a unity of mind, but to the standing which Paul and this church had in Christ, due to His (Christ's) standing in God. The words of this passage are among the most wonderful to be found anywhere in the Bible. They contain a statement of the most profound truth and mystery that we have regarding the person of our Lord Jesus Christ. No plummet has sounded their depth, nor rod scaled their height, nor tape measured their breadth. His eternal deity—and on the other hand his amazing self-humiliation—yet these facts and truths are brought before us to enforce the homeliest duties of everyday life. Equal to God (John 10:30) yet he gave up his divine glory and incarnated himself in the historical Jesus, was anointed of God, died on a Roman cross, buried in Joseph's tomb, yet rose again and is alive today as much as when He walked over Galilee's hills. The mind that was in Jesus was a purpose to choose the lowest depth of humiliation rather than a full equality with God, either choice of which he might have made; but he chose the former—creation's most sublime illustration of self-sacrifice—and this is the mind we should have. The word "robbery" implies a thing to be seized hold of. Instead of seizing hold of equality with God, Jesus let go and seized hold of the death on the cross, and thus made Himself of no reputation, literally emptied Himself. The context shows of what He emptied himself: (a) his divine form; (b) his divine glory. This latter is shown by his birth in a stable and his death upon a cross, thereby being under the curse of God (Gal. 3:13). But this was an act of obedience to God (v.8). The father bade him to do it. The sacrifice of Christ had its original source in the will of God—his love towards us (John 3:16, Rom. 5:8). There are three thoughts in this passage: (a) the incarnation; (b) the passion; (c) the exaltation. Keep this in mind and remember Paul's circumstances in prison when he wrote this letter.

III. God Also Hath Exalted Him, vv. 9-11. The result of this comfort of love, due to a state of mind on the part of the disciples and their having the mind of Christ; was first the exaltation of Christ (v 9), and the giving unto him of "the" name, not "a" name, that is above all other names; and secondly, worship on the part of all of God's creation, every knee bowed in submission; and third, confession (v. 11). Jesus, who humbled himself to the lowest place, God has exalted to the highest place. Humiliation of self is the path to exaltation by God.

The worship mentioned here is not merely that we worship through him, though that is true (John 14:6).

The phrase "every knee shall bow" is a clear expression of the oneness of Jehovah and Jesus.

Notice that those that bow are in heaven, in earth and in Hades (Rev. 5:3).

Even lost men and angels who will not bow now will have to do so some day, though it will then have no saving power in it for them.

OUR FASHION DEPARTMENT.

ALL PATTERNS, 10 Cents Each.

THIS department is prepared especially for The Wisconsin Farmer. We can supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10 cents each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering, all you have to do is to write your name and address plainly, tell us the correct number and size of each pattern you want and inclose 10 cents for each number. We agree to fill all orders promptly and guarantee safe delivery. Address all orders to The Wisconsin Farmer, Madison, Wis.

7052 Ladies' Waist.—Cut in sizes 34 to 44 inches bust measure. This waist is the last word in style and simplicity. The closing is in the front, the neck high with turnover collar. There are gathers along the shoulder seam in front, but the back is plain. The full length sleeve is gathered into a fancy cuff.

7553 Ladies' Skirt.—Cut in sizes 22 to 32 inches waist measure. Striped serge or broadcloth can be used for this skirt. It can be made with or without the applied yoke. High or regulation waistline may be used.

7536 Ladies' Waist.—Cut in sizes 34 to 42 inches bust measure. Any of the pretty flowered materials can be used for this waist. The neck is finished with a frill of lace and there is a seamless yoke. The long sleeves are finished with a narrow band.

7563 Girls' Dress.—Cut in sizes 4, 6, 8, 10 and 12 years. Any of the pretty striped materials can be used to make this dress with the trimming of plain material. The dress closes at the front and may be made with long or three-quarter length sleeve. The skirt has four gores.

7543 Children's Dress.—Cut in sizes 2, 4 and 6 years. Any of the pretty checked wash or woolen materials can be used to make this dress. The dress closes at the front underneath a box plait. Long or short sleeves may be used.

7583 Ladies' Negligee.—Cut in sizes 34 to 46 inches bust measure. Crepe de Chine or challie can be used for this negligee. It can be made as a long negligee or as a short dressing sacque. Long or short sleeves may be used. The skirt which is cut in two pieces may be plaited or gathered.

7568 Children's Rompers.—Cut in sizes 2, 4 and 6 years. Linen, gingham or percale can be used for these rompers with the trimming of braid. The

rompers close at the front and may be made with either the long or short sleeves.

7128 Ladies' Dress.—Cut in sizes 34 to 44 inches bust measure. The waist of this dress is closed high in the neck, with fancy standing collar. The fronts are gathered along the shoulder and joined to a forward extension of the back. The skirt is cut in four gores.

7546 Girls' Dress.—Cut in sizes 2 to 10 years. This pretty little dress is very simple and easy to make. It closes at the back and can be made with or without the trimming bands. The plaited or gathered skirt may be used.

7572 Misses' Dress. Cut in sizes 14 to 20 years. Plain and plaid materials are combined in making this stylish little dress. The dress closes at the front and may be made with either long or short sleeves. The skirt is cut in two gores.

Price of any of these patterns 10 cents each.

VETERINARY MATTERS

PROFESSIONAL Veterinary advice through this department to regular subscribers only. We do not answer veterinary inquiries for the benefit of "neighbors." Parties desiring information will be required to send their names in full with their address. No question will be answered by mail unless accompanied by a fee of one dollar. In order that correct information may be given, the symptoms should be accurately described, stating of how long standing, together with color and age of animal, and what treatment, if any, has been resorted to. All veterinary inquiries should be addressed to this office.

AILING ANIMALS.

Scab.

What is good for scab on cows?

It is hard to advise treatment without knowing the cause of scab in this particular case. The use of the lime and sulphur dip has proven most effective. Pamphlets can probably be had on this subject by writing to the department of agriculture at Washington.

Dislocation of Patella.

I have a horse coming four years old in May that when he raises his leg up high the stifle cap will slip to the outside. It will go back again of itself if he is on level ground. He had this for a year. Can anything be done for him? Can the cap be taken out without injury to the horse?

This trouble is of such long standing that it is doubtful if any good can be done with treatment. Do not enter in for a moment the proposition of removing the patella, as it would be the ruination of the horse.

Injured Teat.

I have a red heifer coming four years old that will be fresh the 26th of next month. After she had her first calf the end of one of her teats was cut off by barbed wire. The teat gives milk, but spatters all over the pail. Could the teat be punctured and healed over without any ill effect?

The trouble could possibly be overcome with the right kind of treatment, but we would advise you to let an experienced veterinarian do the work, as poor work on it might only tend to make it worse.

Rheumatism in Sheep.

I have a number of sheep and about three weeks ago five of them got lame in the legs. They cannot stand up and I don't know what could be the matter. Have tried different remedies, but they don't seem to help. At night the sheep are kept in the barn and have plenty to eat. They are in good shape, eat and drink the same as usual. It seems to be mostly in the lower joint.

It is very probable that your sheep are affected with rheumatism. At the onset of the disease put the animals in comfortable quarters and give the following: Sodium salicylate, one-half teaspoonful, and sodium bicarbonate, one-half teaspoonful, dissolved in water. Give this amount every four hours. If joints are swollen and painful apply a bandage soaked in saturated solution of epsom salts or soda, and cover with waterproof bandage. If they get better and the joints stay swollen apply tincture of iodine locally once daily.

A LAMP WITHOUT A WICK

The Sunshine Safety Lamp Co., 827 Factory Bldg., Kansas City, Mo., has a new portable gasoline lamp which gives the most powerful home light in the world—a blessing to every home not equipped with gas or electricity. 300 Candle Power at one cent per night. This remarkable lamp has no wick and no chimney, is absolutely safe and gives such universal satisfaction they are sending it on Free Trial. They want one person in each locality to whom they can refer new customers. Take advantage of their free trial offer. Agents wanted. Write them today.—Adv.

Bumper Grain Crops
Good Markets — High Prices

Prizes Awarded to Western Canada for Wheat, Oats, Barley, Alfalfa and Grasses

The winnings of Western Canada at the Soil Products Exposition at Denver were easily made. The list comprised Wheat, Oats, Barley and Grasses, the most important being the prizes for Wheat and Oats and sweep stake on Alfalfa.

No less important than the splendid quality of Western Canada's wheat and other grains, is the excellence of the cattle fed and fattened on the grasses of that country. A recent shipment of cattle to Chicago topped the market in that city for quality and price.

Western Canada produced in 1915 one-third as much wheat as all of the United States, or over 300,000,000 bushels.

Canada in proportion to population has a greater exportable surplus of wheat this year than any country in the world, and at present prices you can figure out the revenue for the producer. In Western Canada you will find good markets, splendid schools, exceptional social conditions, perfect climate, and other great attractions. **There is no war tax on land and no conscription.**

NEWS OF THE SALE RING

Stubbs & Hyzer's Duroc Sale.

The sale of Duroc bred sows and gilts held by Stubbs & Hyzer, West Salem, Wis., Monday, January 31st, was highly satisfactory. In spite of the sale being held on Monday, which makes it difficult for many to attend, there was a large crowd present. A big dinner was served to everyone present, and this entire space could be filled with the menu and the favorable comments made by the guests. It was a banquet in every sense of the word, both in quantity and in quality, and the ladies in charge can be highly complimented. A ten-piece orchestra composed of the young businessmen and young ladies of the city furnished music which was enjoyed and complimented by the diners, and a vote of thanks is hereby tendered. The offering was very good as a whole, the older animals being especially good. They were all well bred and the majority well developed and of good type. There were a few buyers from Minnesota and Iowa, and quite a number from southeastern Wisconsin, while western Wisconsin was heavily represented. It was a notable feature that the richly bred sows and gilts bred to a richly bred boar were eagerly sought. A detailed list of the sale is given below:

1. E. Falconer, Early, Ia. $72.00
2. F. Sprain, West Salem, Wis. ... 38.00
3. J. L. Fisher, Janesville, Wis.. 34.00
4. E. Falconer 60.00
5. Fred Sprain, West Salem, Wis. 80.00
6. A. Fletcher, Bangor, Wis. 36.00
7. G. P. Larson, Mindora, Wis... 31.00
8. J. L. Fisher 30.00
9. Aug. Koehler, Hixton, Wis.... 36.00
10. W. S. Guy, Beloit, Wis. 31.00
11. A. E. Knight, Whitehall, Wis. 40.00
12. E. Falconer 55.00

Atwater's Duroc Sale.

The annual sale of bred Duroc sows held by L. F. Atwater, Bangor, Wis., was a succession of his former successive sales. The bidding was brisk and in the early part of the sale prices were very high. The first ten animals in the ring averaged $108. The top price animal was a fall yearling sow named Defender Lady 457536. She is an outstanding sow of exceptional size, wide and deep with good, thick hams, a good head and ear and well up on feet. Her litter sister was the next highest priced animal, selling for $152.50. The whole offering was one of merit, there not being a poor animal in the lot. The spring gilts were well developed, many weighing 400 pounds and better. There were a great many buyers from southwestern Wisconsin present who bought liberally. There were also a goodly number of animals purchased by Minnesota buyers. A fine dinner was served at noon by Mrs. Atwater and friends, which was thoroughly enjoyed and they may well feel proud. Col. I. E. Stickelman, Clarinda, Iowa, did the selling in a clean-cut businesslike manner and Wisconsin breeders will do well to secure his services. John L. Jones, Leon, Wis., an auctioneer of local fame, assisted in the ring. Following is a list of sales:

1. Filney Farm, St. James, Minn. $237.50
2. Wm. Thomas, Ridgway, Wis. 152.50
3. R. W. Culbertson, Rochester, Minn. 120.00
4. W. C. Jenkins, Bangor, Wis. 30.00
5. B. L. Rundell, Roberts, Wis... 34.00
6. R. W. Culbertson 101.00
7. M. J. Bowler, Sparta, Wis... 36.00
9. A. G. Vonder Ohe, West Salem, Wis. 33.00
10. Dennis Shea, Melvina, Wis... 50.00
11. J. Aldrich, West Salem, Wis. 32.00
12. Bernard Meyer, Watertown, Wis. 51.00
13. Gant Farm, Delavan, Wis.... 60.00
14. A. E. Kirst, Tomah, Wis..... 71.00

SUMMARY.

49 head ....$2,769.50; average....$56.52

Laird's Hampshire Sale.

In spite of the bad weather and roads which prevailed Friday, January 21st, the sale of Hampshire swine held by A. M. Laird, Prairie du Chien, Wis., was very satisfactory. In addition to the animals sold in the ring Mr. Laird, also made a number of every good private sales. An interesting feature of the sale was a demonstration of a Hampshire carcass. Hampshire swine are noted for the fine quality of meat which they produce. The fat and lean layers are laid in alternately and is particularly free from gristles. Mr. Laird had the dressed carcass of an eight months old barrow and gave a short talk on the superiority of the Hampshire. He called attention to the long, heavy loin, the evenly marked side bacon, the compact heavy hams and shoulders and the good head. Chas. O'Neill, Bridgeport, Wis., cried the sale.

The Bloomington Horse Sale.

The eighteenth annual sale of draft horses of the different breeds at Bloomington, Ill., January 25th, 26th, 27th and 28th, under the management of C. W. Hurt and Dan Augstin, drew many buyers and practically 250 head of horses were sold for approximately $94,000. Bidding on the better sorts was good all through the sale, there being an especially keen demand for good mares and fillies. The top for stallions was $1,300. Another stallion sold for $1,250 and one for $1,150. In each case they went to Illinois buyers. The market for mares was extra good and there were numerous sales above the $500 mark. Every section of the country from Pennsylvania and New York in the east to Montana on the west, and from Minnesota to Tennessee was represented at the ringside and many carlot buyers were in attendance. The outcome of the sale demonstrated the healthy condition of the draft horse market and should be a source of gratification to horsemen generally. Chas. W. Hurst managed the sale in his usual efficient manner and the auctioneers were Cols. Carey M. Jones, Fred Reppert, Orval Jones, Lloyd Seeley, J. J. Rolofson and assistants.

HALF INTEREST IN CARNOT SOLD.

Record-Breaking Price for Half Interest in Great Percheron.

Important news comes to The Wisconsin Farmer from White Hall, Ill., to the effect that Mr. W. S. Corsa has sold a half interest in the great Percheron stallion, Carnot, to Robert Leeds, of Richmond, Ind., for the sum of $20,000. Coming at a time when here and there can be found men who are weak-kneed over the future prospects of draft horse breeding, this event is history-making in more than one respect.

Carnot is not only the greatest show and breeding horse in the United States, but he is possibly without a peer today even in his native land. Mr. Leeds has courage, to be sure, in making the investment of this huge sum, but, barring accidents, there is no question but what the future will demonstrate that the venture embodied a splendid display of foresight and forethought.

A PREMO CAMERA

Is a Necessity--Not a Luxury

This camera is made by the Eastman Kodak Co., is of the box type, with universal focus lens, the simplest instrument for picture-making that can be devised. It will produce excellent results in the hands of anyone; no experience necessary. Film pack used, daylight loading. Pictures 2 1-4 x 3 1-4. Booklet of instructions included with each camera.

HAVE YOU ALWAYS REGARDED A CAMERA AS MERELY A "PLAY-THING?"

What do you raise?

Fruits? Livestock? Grain? Flowers?

It doesn't matter--whatever it is, you raise it to sell, don't you? Now, how much better than "telling" distant prospective customers what you have, is ***showing*** them! You can't bring them to your farm, but pictures will get practically the same result. One picture tells more than pages of words.

What better way of keeping a record of growth, than by pictures?

A Picture of old Dobbin with Baby on his back, will be priceless twenty years from now.

HERE'S HOW YOU CAN GET A CAMERA--

Given with The Housewife for one year at $1.80. Cameras sent postpaid, delivery guaranteed.

Remit by P. O. Money Order or Registered Letter. Address

The HOUSEWIFE, 30 Irving Place, New York City

Live Stock Items and Commercial Notes

Gathered by Representatives of The Wisconsin Farmer

Lybrand's Percheron Dispersion.

THE Percheron stud of the late R. C. Lybrand, Richland Center, Wis., was one of the best in the Northwest. Mr. Lybrand was a discriminating judge of good Percherons and selected his breeding stock with great care. The older mares in the stud are an indication of his good judgment and the younger animals are evidence that his selections were excellent transmitting animals. Owing to the death of Mr. Lybrand this stud will be sold at public sale Monday, February 21st. See advertisement on page 37. The stud consists of thirty-eight head including the mature stallion, Imp. Tripoli 27449 (46168), fifteen mature mares, seven stallion colts and twelve mare colts born in 1014-1915, one three-year-old stallion and three three-year-old mare colts. It is an offering that our readers should not fail to see, as this sale will present an opportunity to get some extraordinary values. The animals have never been pampered, and appear in rough coats of hair, as this has been a breeding establishment where only the young animals have been sold in carload lots. For this reason they have not kept them in show ring shape. However, they are the equal of many noted prize winners, for they have the backs, limbs, heads and rumps of the most desirable type. They are all sound as "a hound's tooth" and will stand veterinary examination. In breeding they represent the best blood lines of the breed. The stallion, Imp. Tripoli 27449 (46168) is by Othello 22623 (42829). He is a fine type of animal himself and his colts show up in fine shape. There are eleven stallion and mare colts sired by him that are as uniform in color, size and type as is often seen. The three-year-old stallion is out of the mare, L'Amia 45407 by Imported Sultan 24723 (43644). The mare, Letta Highland, and three of her colts are in the sale. She is by King of Highland by King of Perch, and is of equally good breeding on the dam's side. A black mare, Mora by Valseur 42833 (56387), is a fine type of a mare and should be looked over. Space does not permit going into detail with all the animals, but full breeding and description is given in the catalogs which are now ready for mailing. We urge both breeders and farmers to attend this sale, for there are horses here that will fill the wants of both. Col. Carey Jones, Chicago, will conduct the sale. Send for catalog to J. W. Martin, Mgr., Gotham, Wis.—Adv.

Currie's Hampshire Swine Sale.

HAMPSHIRE swine will be sold at public auction, Wednesday, February 23, 1916, by R. L. Currie, Viola, Wis. This herd is one of the largest and best known herds of Hompshires in the Northwest. Many of the best breeders in Wisconsin, Illinois, Iowa and Minnesota have selected their breeding stock from this herd. Although not forced or kept in show shape they have true breed type, the majority are well belted and the fact that they are the most desirable type obtainable is shown by the purchases made by such breeders as DeKalb and Yates. The offering is one of exceptional merit, consisting of twenty big, private foundation sows, forty extra good spring gilts and the balance fall sows of various ages. The yearling and older sows are daughters of such great boars as Aristocrat Jr. 26789, a grandson of Bon Bon Beauty grand champion at the Illinois State Fair; King Midas by Viola Chief; Orchard Hill Duke Jr. by Orchard Hill Duke, a boar bred the same as Messenger Boy 6179, that was fifteen tmes grand champion. The spring gilts and older sows are bred for March, April and May farrow to DeKalb's Gen. McArthur. He is one of the best bred sires living. He is a son of Erlanger, the noted show boar, and his dam was Jennie Aylor, conceded to be one of the great foundation sows of the breed. She was sired by Longfellow, that sold for $1,000. A litter sired by this boar will prove very profitable. The balance of the gilts are bred to Currie's Champion 28387 and Currie's King 28383. The sows in this herd have been very prolific, and have saved nearly all of their pigs. The pigs are strong, healthy and vigorous. Plan to attend this sale in person if possible. However if impossible send a mail bid to the auctioneer, Chas. W. O'Neill, Bridgeport, Wis., or H. S. Hoard, representative of The Wisconsin Farmer. See page 37. —Adv.

Get the John Deere Farm Implement Book.

ONE of the greatest factors in lessening farm work and increasing farm profits has been the increasing use of good farm machinery and in this development the John Deere Company, of Moline, has been one of the pioneers and leaders. "Better Farm Implements and How to Use Them" is the title of the 168-page reference book which they are sending to every inquirer who writes them, stating what farm implements he is specially interested in and asking for Package No. X-64. This book is a veritable encyclopedia of information about the proper use, care and handling of farm implements and is typical of the thoroughness and dependability which characterizes everything that comes from the John Deere factory. In writing for your copy address John Deere, Moline, Ill., ask for package X-64 and kindly mention their advertisement on page 11, illustrating and describing some of their most useful farm implements.—Adv.

Lefebures' Royal Belgian Horses.

HENRY LEFEBURE & SONS, the American pioneer importers of Belgian stallions and mares have just issued their twenty-eigth annual catalog which is very interesting to anyone breeding draft horses whether they be pure bred or grades. The catalog contains some sixty illustrations of stallions and mares to be seen at the Lefebure farm and of the four different farms owned by the Lefebures. The catalog is an artistic one and gives much useful information. Mr. Henry Lefebure, the senior member of this firm is a native of Belgium and is very familiar with conditions in that country and it is his opinion that in years to come only an occasional stallion will be sold for exportation. Mr. Lefebure has the largest collection of Belgian mares in the country and is growing upon his farms Belgian stallions and fillies that compare favorably with those produced in the native land of the Belgian horse. A few Percherons are also offered for sale by the Lefebures. Any of our readers in the market for a high-class Belgian or Percheron stallion should visit the Lefebure farms before purchasing. This firm won premier champion exhibitor and premier champion breeder at the Panama-Pacific International Exposition, 1915, which is sufficient evidence that the Lefebures handle the best to be found in Belgians. See page 38 and write for catalog, mentioning this paper.—Adv.

Underwood Red Polled Cattle.

THE Underwood Stock Farm, Gotham, Wis., owned by L. C. Underwood, has been the home of Red Polled cattle for over twenty years. By careful selection and mating of good individuals of proven breeding there has been produced a herd of excellent animals. They have been following the blood lines of the noted bull, Corporal, very strongly crossing with other blood lines of equal merit. Mr. Underwood is offering his junior herd bull, Jerome 27287, for sale. He was sired by Jap 22585 by Corporal's Guard, which was by Corporal and out of an Hesperus-bred dam. Several young bulls are also offered for sale. These are by Champoin by Dewey by Cremo, one of the greatest show bulls of the breed. His dam, Celia, is of Corporal breeding. Several fine yearling heifers are also offered for sale. These are daughters of King Richard 14533 by King Henry. His dam, Rose, was by Corporal. It will be seen that the breeding of these animals is of the best known to the breed. As individuals they can scarcely be faulted, as they are well grown and of good straight breey type. Mr. Underwood has sold many animals to readers of The Wisconsin Farmer, who have invariably been well pleased. For further information in regard to the animals now offered for sale write to the above address. See page 38.—Adv.

Plums for Wisconsin Farmers.

PROFFESSOR HANSON, of the Brookings, S. D., agricultural college and experimental farms, has developed a hardy plum which not only has the quality of hardiness, but it is one of the largest grown. The flavor, too, is second to none. There are several of these, all closely allied, yet somewhat different. To the farmer, or nursery man in Wisconsin, Minnesota or the Dakotas, these plums appeal most strongly on account of their unusual hardiness. They cannot be recommended too strongly. This plum is handled by the Gurney Seed and Nursery Co., Yankton, S. D., which company is prepared to fill orders very promptly. They will furnish you dependable stock, true to name. They also have a large quantity of well-matured and dried seed corn concerning which they will be pleased to furnish you further information. Write them for their catalog of seed and nursery stock—they issue a very complete catalog. In writing please say that you saw their notice in The Wisconsin Farmer. See page 19.—Adv.

Three Machines in One.

EVERY farmer knows the importance of a well-pulverized seed bed. The Western Land Roller Co., is advertising on page 8 a machine that pulverizes, packs and mulches all at one operation. It is said to save time, seed and horse power in covering grass and clover seed and in rolling corn and young grain in the spring. It is made in eight sizes and sold for $20 and up. You can find out all about it by writing for their free catalog and mentioning this paper. Address Western Land Roller Co., Box 454, Hastings, Neb.—Adv.

Hart Bros.' Stallions.

THE firm of Hart Bros., Osceola, Iowa, are offering a great string of imported and home-bred Percheron and Belgian stallion and mares for sale, and they will be pleased to have intending purchasers come and see them. They also offer a choice lot of fillies for sale. They will be pleased to tell you just what they have on hand if you will only write them. When corresponding with them kindly mention The Homestead. See page 38.—Adv.

Pritchard & Sons' Horses.

THE announcement in another column of W. E. Prichard & Sons, Ottawa, Ill., will be of interest to any reader of The Wisconsin Farmer who is in the market for a good Percheron stallion or a span of producing mares. For over a third of a century the senior member of this firm has been recognized as one of the best constructive horse breeders in the country, and the junior members of the firm have spent their entire life in the producing of good horses along the lines that have brought success and reputation to the Ottawa establishment. While this firm has made importations each year for several years until the breaking out of the war, they have achieved signal success in their breeding operations, producing a class of horses that are in every way the equal of the imported animals, and that have behind them the guarantee of a thoroughly reliable firm. Some of the best young stallions that are to be seen anywhere can be found in the pastures of the Prichard farms, the rugged, quality kind, with size, bone, action and conformation, and coming from the best of producing ancestry. In the barns at Ottawa are a few imported horses and a strong lot of young home-bred stallions that will give a good account of themselves under proper care and treatment. In addition to their Percherons, Messrs, Prichard & Sons have a few extra good Belgian stallions, acclimated and in first-class condition. These gentlemen carry on their business at the minimum of expense, and are in a position to quote customers some very attractive prices. Buyers will find both the firm and its horses reliable in every way. Write them today, mentioning that you saw their advertisement in The Wisconsin Farmer. See page 38. —Adv.

Increasing Farm Valuations.

TWO retired farmers were recently discussing the improvements in everything that enters into farming since their active days, but nothing struck them more forcibly than the general use of wire fencing, which is replacing the old wooden fences everywhere. One remarked, "If we had had wire fences we would neither of us be as physically worn out as we are today," to which the other replied, "Yes, and if my farm had been enclosed with a wire fence it would have made me $1,000 more." It is undoubtedly true that wire fencing is a better investment than money in the bank, but care should be used in selecting the right kind of fence. The Peerless Fence Co. will send a free catalog on receipt of postal card request from any of our readers, describing their wire fences that eliminate any danger of your making a mistake. Peerless fences have many special features, such as the one-piece cross bar that prevents animals crowding the fence down from the top or pushing through at the bottom, while the patent non-slip knot holds the wires always in place. In addition to describing their different styles of field, poultry and lawn fences the new Peerless catalog contains full information about their many kinds of gates, all of which are heavily electro galvanized, requiring no paint to prevent rusting. Peerless gates and fences are easy to buy, easy to put up, have a fine appearance and give long service. In writing for their catalog address Peerless Wire Fence Co., 206 Michigan St., Adrian, Mich., and kindly mention this paper.—Adv.

Apex Fences and Steel Posts Give Satisfaction.

APEX fencing has some special features which are said to make it an exceptionally good-looking fence, easily put up and having long-wearing qualities. Its swinging joints lets the line wires fit the ground easily, no matter whether it is smooth or rough, level or hilly. Its stay are doubly strong and distribute the shock evenly, so that the fence keeps its shape. Apex steel drive posts are strong, though light in weight, and cost less than wood posts. They will last indefinitely and save digging, tamping, and a large part of the work of hauling and handling. They can be driven in any soil without injury. For interesting free books on Apex fences and steel posts write to the Janesville Barb Wire Co., 433 S. Frankling St., Janesville, Wis., and kindly mention their advertisement on page 26. —Adv.

"The KisselKar Every Inch a Car."

THE KisselKar is a carefully manufactured car, not an assembled one, with its own distinctive design, motor and equipment. It is often described as "every inch a car" because of the care which has been put into every detail to make it serviceable and convenient. It has power to spare, plenty of room and an appearance that will compare favorably with any car on the market. The KisselKar "High Efficiency Thirty-Two" at $1,050 is a car that will give complete satisfaction to any buyer and enable him to enjoy all the comforts and luxuries of motor perfection. If you will write to the Kissel Motor Car Co., 312 Kissel Ave., Hartford, Wis., and mention their advertisement on page 13, they will be pleased to send you your nearest KisselKar dealer's name and other interesting and valuable information.—Adv.

Coldren's Holstein Dispersion.

THIRTY-SEVEN registered and thirty high-grade Holsteins will be sold at public auction Thursday, February 17th, by C. J. Coldren, Brodhead, Wis. The high grades are well marked, of good, straight type and heavy producers. Many of them are practically pure bred, but of course not eligible to registry. The pure breds are a very good lot of cattle. He purchased his foundation stock from Fred Trumpy, whose herd was estabished over forty years ago and who was conceded to have one of the best herds in southern Wisconsin. The majority of the animals in the herd were sired by four bulls, viz., a son of Sir Johanna Fayne, a son of Homestead Jr. De Kol, a brother of the great world's record cow, Tilly Alacantra, and a bull of Sadie Vale Concordia breeding. Many of them trace very close to Hengerveld De Kol, which has 116 A. R. daughters, eight with records above thirty pounds. Nutula Fobes Sir Celacatra is the sire of several in the sale. He is a brother to Tilly Alacantra, which gave 30,000 pounds of milk in a year and made thirty-one pounds of butter in seven days. He also has a 34.89-pound sister and several A. R. O. daughters. Homestead Longfield De Kol, the sire of several head, is a son of Homestead Jr. De Kol, which has sixty-nine A. R. O. daughters, five with records from 30 to 35.55 pounds of butter in seven days. There are also several grandsons and daughters of Pontiac Amphion, a son of Hengerveld De Kol. All parties will be met at the train and taken to the farm. This sale will present an opportunity for our readers to get some exceptionally well-bred foundation stock. Plan to attend the sale or send a mail bid to the auctioneer, Col. Edgar Eells, or H. S. Hoard, who will represent The Wisconsin Farmer. See page 36.—Adv.

Columbia Asylum Poland China Sale.

THE Columbia County Asylum, Wyocena, Wis., will hold a sale of thirty-six bred sows on Tuesday, February 15th. The offering consists of twenty gilts and sixteen proven sows. These are daughters of Columbia Wonder and Columbia Pete and Columbia Orange. Columbia Pete is a son of Wisconsin Orange by Big Orange, the famous boar bred by Peter Mouw and owned by J. O. James. The dam of Wisconsin Orange is a daughter of John Blain's noted boar, Pawnee Lad. Columbia Wonder by New Wonder by the famous boar, A Wonder, and out of a daughter of Big Bone, and A Wonder Price dam. Columbia Orange is by a son of Long Orange by Otto Big Orange. It will be seen that the breeding is of well-known and proven blood lines. The gilts are well grown, in good, healthy, breeding condition. It will pay to attend the sale. For further information in regard to these animals write to S. C. Cushman, superintendent Columbia County Asylum, Wyocena, Wis. See page 36.—Adv.

Laird's Hampshire Swine.

HAMPSHIRE swine of the highest breed type are the kind that comprise the herd of A. M. Laird, Prairie du Chien, Wisconsin, whose advertisement appears on page 37. He is a careful. discriminating judge of Hampshires and his herd shows the result of careful selection and good care. His herd boar, Kornfalfa King, won junior champion honors at the 1915 Wisconsin State Fair. The majority of the animals in the herd trace to Jimmy and Orchard Hill Duke, two noted boars that weighed over 1,000 pounds. The gilts offered for sale are daughters of Laird's Rexall, an outstanding boar which Mr. Laird recently sold for $250.00. He is a richly bred animal and his offspring show wonderful development. These gilts are bred to the junior champion boar, Kornfalfa King. For further information in regard to the animals offered for sale write to the above address. When writing kindly mention this paper.—Adv.

"Armco" Culverts Resist Rust.

EVERY farmer putting in a culvert is looking for one that will withstand rust. "Armco" culverts, made of American ingot iron, are said to be wonderful rust resisters, as is shown by the illustrations in their advertisement on page 14, of three kinds of culvert material after they had been exposed to the elements for three years. "Armco" quality is due to uniform purity and scientific manufacturing. You can secure full information about "Armco" iron culverts, flumes, sheeting, roofing, etc., by writing to Armco Iron Culvert Mfgs. Association, Cincinnati, and mentioning this paper.—Adv.

Don't Have Sagging Gates.

CAN'T-SAG" gates are just what their name implies—farm gates that cannot sag, because they are made of boards, double bolted (not nailed) between eight steel uprights. They

Holstein Dispersion, Thursday, Feb. 17, '16, Brodhead, Wis.

C. J. Coldren's Herd of 37 Registered and 25 High Grade Holsteins

The grades are well marked—of good, straight type and of good productionability. The Registered Cattle are well bred and from high producing strains. The majority are daughters of the following bulls—one a son of **Sir Johanna Fayne**—a son of **Homestead Jr. DeKol**—a brother of the **30,000 pound milk cow, Tilly Alacartra,** and a bull of Sadie Vale Concordia breeding. Come to the sale or send a mail bid to **Col. Edgar Ells or H. S. Hoard,** representating Wisconsin Farmer.

cost less than wooden gates and will wear five times as long. If you prefer you can get the gate steels and make the gate with your own lumber. Full information will be furnished if you will write Alvin V. Rowe, President Rowe Manufacturing Co., 1713 Adams St., Galesburg, Ill.—Adv.

Don't Let Cows Get "Off Their Feed."

WHEN your cows get "off their feed," as the saying is, it's time for you to act quickly, but they really shouldn't be allowed to get in that shape. If they do get sick there is a remedy in Dr. David Roberts' complete line of stock remedies that will help you out, but a pound of his famous Cow Tonic is worth many doses of medicine after things have started bad. It contains nature's ingredients from roots, bark and herbs, which a cow needs and which she would get if in the open and it will put your cows in the very best condition and keep them there, enabling their digestive and eliminating organs to work efficiently all the time. In his advertisement on page 22 Dr. Roberts describes some of his other excellent cow remedies and offers to send enough of his "Stokvigor" for ten cents to feed a cow for two weeks. His 184-page book, "Practical Home Veterinarian," treating of all live stock and poultry ailments and their proper treatment, will be sent for 25 cents additional. In writing him address Dr. David Roberts Veterinary Co., 950 Wisconsin Ave., Waukesha, Wis., and mention of this paper will be appreciated.—Adv.

More Farmers are Using Motorcycles.

FOR an always ready, rapid means of getting about, a Harley-Davidson motorcycle is a source of never-ending convenience on the farm. With a side-car attachment, which can be put on or taken off in a few moments, it becomes a family conveyance that will take you to town or to the neighbors in short order and at very little expense. It is a constant source of delight and recreation to take a spin in one of these reliable machines and if you get one you will find a hundred uses for it which you cannot now realize. For fourteen years the makers have specialized in making motorcycles that are dependable and durable and they have produced a machine which is not only a luxury, but fast becoming recognized as a farm necessity. Most dealers sell Harley-Davidson machines on terms that will be satisfactory to you. If you don't know a Harley-Davidson dealer, write for their interesting catalog to Harley-Davidson Motor Co., 1155 A Street, Milwaukee, Wis., and kindly mention their advertisement on page 17.—Adv.

Many Uses for Atlas Farm Powder.

A STUMP that has been blasted out can be easily hauled away and used for kindling wood. Many farmers are finding this a highly satisfactory way of clearing their land. Atlas farm powder is said to have been the original farm powder for this and similar farm purposes. There are many other uses to which Atlas powder can be put on the farm to great advantage, such as boulder blasting, loosening the subsoil, tree planting, ditch digging, etc. The Atlas Powder Co., has an interesting and instructive booklet on all these matters, which is offered free in its advertisement on page 8. If you will check off the particular use you would be interested in on the attached coupon and mail it to the Atlas Powder Co., Wilmington, Delaware, they will be pleased to send you a copy of this seventy-four-page booklet, "Better Farming," without expense to you. In so doing kindly mention this paper.—Adv.

No Guesswork in Hatching.

PROGRESSIVE incubators are built with hundreds of dead air cells to protect the eggs from sudden changes of temperature. They make hatching a matter of certainties, not guesswork. Many users report chickens from every hatchable egg. They are finely built of California redwood, with all the best features of a good incubator. Their big 155-egg incubator sells for $7.85 with money back at 8 per cent if it doesn't make good. A progressive brooder goes with it for only $2.00 extra, freight prepaid east of the Rockies. For further details, including their 1916 combination offers, send for catalog and free poultry book to Progressive Incubator Co., Box 128, Racine, Wis. Mention of their advertisement on page 24 will be appreciated.—Adv.

Wisconsin Incubators are Thoroughly Reliable.

WISCONSIN incubators are shipped on thirty days' free trial, with freight prepaid east of the Rocky mountains, and your money back if not perfectly satisfied. They also have a ten-year guarantee. Their 139-egg incubators and brooders, which have proven their worth in many a contest, sell for $10.00. They are made of the finest select California redwood, with hot water heat, double walls, double glass doors, copper tanks and boilers and are self regulating. They are

MY NEW FREE BOOK WILL SETTLE THE SPREADER QUESTION FOR YOU NOW!

If you are undecided about buying a spreader—if you do not know what machine to buy—if you doubt whether a spreader will pay—then read this great new book! It tells you in dollars and cents just what a spreader will do for you on your farm. It tells why I began building spreaders and how we have steadily improved them; it tells about my many patents which fully protect the special Galloway Spreader features. I want you to have this book—that's why I'll send it to you for a post card request.

SPECIAL 90 DAY PROPOSITION I have a special proposition for you from now until seeding time which should sell 25,000 machines in the next few weeks. I want you to take a Galloway spreader right onto your farm and test it out. I want you to see how it will lighten the work of getting the manure on the fields. You know that nothing will pay you bigger profits than getting the winter's accumulation of manure out onto the land. A hundred loads or so will pay for the Galloway spreader because of the extra profit you would not otherwise get. Let me send you this new proposition and new 250 page book that tells the whole story.

New all steel Beater and V-Rake. Steel Tongue.

LOW 1916 PRICES AND LIBERAL SELLING PLANS. Galloway was first to lower high spreader prices. I have kept spreader prices down and led in spreader improvements. Buying material in great quantities, manufacturing in my own chain of factories by the thousands, and selling direct at one profit to the customer, has been the reason for the great growth of this business! That's why they say "Galloway divides the melon with his customers." Spreader prices now lower than ever, and you can buy on one of six selling plans, including no money down, a year to pay and five other buying plans.

1916 SPREADER FEATURES Light draft, two horses handle it; low down, double chain drive, cut under front wheels, channel steel frame, trussed like a steel bridge, steel tongue, endless apron, force feed, top of box only 42 inches high, with our improved Model V-rake and all steel beater which makes a finer and wider spreading machine than ever. Shipped from Waterloo, Kansas City, St. Paul, Council Bluffs and Chicago. My new 1916 easy selling plans, cash or time, are fully described in my book, which is mailed for the asking. Write today.

WM. GALLOWAY CO.
BOX 39 WATERLOO, IOWA

complete as shipped and can be operated at a minimum of expense and bother. Their 1916 catalog contains much information that poultry raisers should have, and tells of the many Wisconsin incubator merits and triumphs. When writing for it address Wisconsin Incubator Co., Box 102, Racine, Wis., and kindly refer to their advertisement on page 24.—Adv.

P. & O. Corn Planters Easily Operated.

A PERFECT stand of corn is the aim of every good corn grower and one way of helping accomplish this aim is to use a P. & O. variable edge drop corn planter. It can be instantly adjusted, without stopping the team, to plant two, three or four kernels to the hill. It is simple in construction with nothing to break or get out of order. The driver operates it from his seat with his foot. It has a sight feed without glass, giving an unobstructed view. It can be furnished with a flat drop attachment, fertilizer attachment or pea and bean attachment. Every one is thoroughly tested before it is sent out. You can ask your dealer about it or write Parlin & Orendorff, Canton, Ill., mentioning their advertisement on page 6.—Adv.

"More Wagon For the Money."

IN buying a wagon the lighter the draft the better it is, if durability has not been sacrificed. West Bend wagons are said to have an unusually light draft and at the same time to have such strong construction as to stand up under the hardest wear. When the quality of West Bend wagons is considered the price is said to be much lower than you would expect to pay. Their motto is "More wagon for the money" and by following this policy they have increased their sales every year. A catalog showing a full line of West Bend farm wagons will be sent free on request to Schmidt & Stork Wagon Co., 123 Mill St., West Bend, Wis., if you will mention their advertisement on page 18 when writing.—Adv.

Why Waste Butter Fat on Calves?

WITH butter fat worth $600 a ton you can't afford to feed it to the calves, especially when you can substitute Blatchford's calf meal so easily and get equally good results. You can get 100 pounds of rich milk value from 100 pounds of Blachford's calf meal and it will cost only one-fourth as much. The calves like it, thrive on it and make you much bigger profits than if they were using up the mother's milk and butter fat. The booklet, "How to Raise Calves Cheaply and Successfully Without Milk," will be sent free to anyone replying to their advertisement on page 23 and addressing Blatchford Calf Meal Factory, 63 Madison St., Waukegan, Ill. In writing mention of this paper will be appreciated.—Adv.

Buckeye Drills Save Repair Bills.

THE disk bearings on Buckeye grain drills are very easy to get at. There are no rivets to cut; all you have to do is to take out three bolts. This saves repair bills and if the bearings ever wear out they will be replaced free by the makers. Many other exclusive features which make the Buckeye one of the best drills on the market, are given in the Buckeye drill catalog, which you can secure by writing for it to The American Seeding Co., Springfield, Ohio, and mentioning this paper.—Adv.

Compound Incubators Offer Big Values.

THE Warsaw Incubator Co., are advertising some special values on their Compound incubators in their advertisement on page 24. They are made in various sizes and are said to be constructed of high quality material

COLUMBIA COUNTY ASYLUM

Will sell at Public Auction 1:30 P.M. Tuesday, FEBRUARY 15, 1916

36 REGISTERED Poland China matrons, 20 gilts and 16 proven dams. Also some others. For particulars write to **Supt. S. C. Cushman, Wyocena, Wis.**

that will last a lifetime. Farmers who are considering buying an incubator are invited to send for their 1916 catalog giving rock-bottom prices, before buying. In writing address Warsaw Incubator Co., Box 233, Warsaw, Ill., and mention their advertisement in this paper.—Adv.

Rayo Incubators Conveniently Arranged.

RAYO incubators have a flame regulator that is said to save from three to six gallons of oil every hatch. A single one-gallon filling of the oil tank is enough for any hatch. Its central heating system provides an even temperature throughout the egg chamber and its hinged glass top puts eggs and thermometer all in plain sight. They will be pleased to send their hatching chart and instructive booklet, as well as their catalog, to anyone writing Rayo Incubator Co., U. D. Station, 3369, Omaha, Neb. In writing kindly mention their advertisement on page 25.—Adv.

Help the Backward Cow Along.

A FIFTY-CENT package of Kow-Kure is said to do wonders for a backward cow and small doses given regularly will go a long ways towards preventing the common cow diseases. It is used in hundreds of herds with beneficial results and will do as well for your animals as for the thousands of head it has already helped greatly. It can be had in fifty-cent and $1.00 sizes at all feed stores or druggists, or by writing to Dairy Association Co., Lyndonville, Vt., and mentioning the advertisement on page 22.—Adv.

Krueger's Percherons.

ATTENTION is called to the advertisement of E. G. Krueger, Ixonia, Wis., on page 38. He is offering six registered Percherons that will appeal to our readers. They are of extra good breeding and as individuals can scarcely be faulted. Send for pedigrees and description of these animals to the above address—Adv.

ONE of the greatest problems in helping along the cause of the farmer has been to distribute the information obtained by the colleges and experiment stations in such a form that it could be used by the farmers and that it could be a help to them. The facts must be presented in a simple and brief form, as the farmer is a very busy man and does not have time to look up the meaning of big words, or to read page upon page of printed matter to get a few words of real information. Some of the larger companies interested in greater prosperity for the farmer have from time to time undertaken to help in this matter. For six years the International Harvester Company, with headquarters at Chicago, has issued what it calls an Almanac, brim full of information boiled down into a few words, so that the farmer might use it as a handbook of farm knowledge. These almanacs sent out by the Harvester Company have been different each year, so that the farmer receiving them might keep them all with profit, each one making a separate volume in the set. The almanac has come into greater demand every year, so that more than 2,000,000 were required in 1916 to meet the requests of the farmers. The new Harvester Almanac comes up to the standard set by previous issues, or even surpasses them. It is bound in a cover printed in colors by the new offset process and contains forty-eight pages of closely-condensed information with many illustrations. Among the many subjects discussed are proper methods of feeding silage, plans for farm home building, fuel for kerosene engines, weights and measures, suggestions on how to handle stable manure, information on the use of lime to sweeten the land, directions for proper tillage, figures on dairying, prevention and cures for hog cholera, etc. The almanac is distributed free, and it is the purpose of the Harvester Company to mail one to every farmer who is interested. Realizing the increasing demand, an extra quantity was printed this year, and until the supply is exhausted a copy will be mailed upon request. Please mention this paper when you write for the almanac.—Adv.

THOSE LARGE BERKSHIRES

YOU must wear the smile of satisfaction, or there will be no sale. Write your wants today. Address W. A. Freehoff, R. 9, Waukesha, Wisconsin.

FREE to a Few Men. Suit made to measure in latest style and chance to make money in spare time. For samples and offer write Knickerbocker Tailoring Co., Dept. 374, Chicago, Illinois.

IN A letter received a few days ago from Mrs. F. H. Burt, Brodhead, Wis., she says: "Since writing my annual price list on cockerels and cocks, I have had a great many inquiries due primarily to my advertisement in The Wisconsin Farmer. At our recent poultry show at Albany held by the Southern Wisconsin Poultry Association, I entered ten birds and won six ribbons. Among these prizes were two specials. I have sold four cockerels to James Landon, of Appleton, Wis. I also shipped a very fine cockerel to Mrs. Mark Tatro, of Bruce, Wis. The remainder of birds are doing exceptionally fine and I believe there should be quick sales for them.—Adv.

THE Pullman Motor Car Co., York, Pa., offers a big, comfortable, easy-riding automobile for $740.00. This car is attractive in design and is a comfortable car in which to ride on account of the ample room in the tonneau. Exceptional claims for durability and economy are made for this car. Catalog and illustrations may be secured by writing the address given herein. Please mention The Wisconsin Farmer when you write.—Adv.

W. A. FREEHOFF, Waukesha, Wis., has an advertisement on this page of this issue that will interest breeders of large Berkshire swine. Write him your wants, mentioning The Wisconsin Farmer.—Adv.

McKevitt's Percherons.

SEVERAL Percheron stallions of various ages are advertised for sale on page 38 by McKevitt Brothers, Bridgeport, Wisconsin. One of these is the imported stallion, Kubain. He has well-formed hips and big bone and is black in color. They also offer a sucking colt sired by him and a ten-year-old blue roan mare bred to him. They also offer two stallions, two and three years old, of blue roan color, weighing 1,500 and 1,800 pounds, respectively. These were sired by Imp. De Cine, a 2,200-pound stallion. They are also offering a Shire stallion weighing 1,850 pounds, a quick breeder and an extra good mover. All of these horses are sound and will stand a veterinarian's examination. McKevitt Brothers are also breeders of Aberdeen Angus cattle and have one of the largest and best herds in Wisconsin. Their herd has been a heavy winner wherever shown. They are offering Angus cows, heifers and bulls of serviceable age and younger and can furnish a car load if desired. For further information in regard to these animals write to the above address. When writing kindly mention this paper.—Adv.

Fine Fence Book for You.

OUR readers will notice with interest that the advertisements of the Brown Fence & Wire Co., Cleveland, Ohio, are again running in these columns. This is the fifteenth year they have advertised with us and they must have obtained a good patronage from our readers to keep it up so long. A letter from Mr. Brown states that their new eighty-page catalog is just off the press and that it is larger and more beautiful than ever. It is a regular encyclopedia of farm fencing and gates of every kind and also describes their new triple angle steel posts. It will be sent at once on postal card request addressed to Mr. James Brown, President Brown Fence & Wire Co., Dept. 35, Cleveland, Ohio. Whether or not you are already one of their 400,000 customers it will pay you to have this new book. In writing kindly refer to this paper. See advertisement on page 26. —Adv.

LYBRAND PERCHERON DISPERSION SALE

Richland Center, Wisconsin, Monday, Feb. 21, 1916

THE noted Percheron stud of the late R. C. Lybrand, Richland Center, Wis., will be sold at public auction. This stud, which consists of thirty-eight head, is one of the best in the Northwest. It is composed of sound, well-developed mares of good breed type and characteristics and their offspring. One mature stallion, seven stallion colts foaled 1914-15, one 1913 stallion, fifteen mature mares, twelve mare colts 1914-15, four 1913 mares. The mature stallion, Imp. Tripoli 27449, by Othello 22623, is the sire of the 1915 crop of colts, all of which are black in color and good individuals. He is an exceptional breeder. Every animal will stand veterinary inspection. This is an opportunity for you to get "seed stock" that is the result of years of breeding. Catalogs, giving breeding and description, are ready. Send for one at once.

J. W. MARTIN, Mgr. Gotham, Wis.

POLAND CHINA SWINE.

Silver Cup Big-Type Poland Chinas!

The greatest prize-winning herd in the state. We proved this by winning 61 ribbons at Wisconsin State Fair. This included 3 champions and 1 grand champion. At the Northern Wisconsin State Fair, we made a clean sweep, getting 1st and 2d on all the herds. We have for sale boars and sows of all ages. This stuff has the size, bone and quality out of big prolific sows that weigh up to 800 pounds, litters averaged 10. Can furnish you sows and boar not related. Pedigrees furnished. Write your wants.

J. D. McDONALD, NORTH BEND, WISCONSIN

BIG-TYPE POLAND CHINAS

SPRING GILTS. Some now bred for March and April litters. Others will be bred for April and May litters or will be sold open as desired. There are daughters of **King Jumbo** by Long Jumbo, that weigh 1106 pounds. **Fall Yearling Gilts,** bred for spring litters to **Big Wonder,** first prize under six months boar at 1915 Minnesota State Fair. **Some Fine Yearlings and Spring Boars** that will do you a lot of good. **SHORT-HORNS. 10 Fine Yearling Bulls,**—roans, red and whites, sired by **Highland Sultan,** a grandson of Whitehall Sultan. **25 Cows and Heifers** from six months old and up. These are of Scotch and Bates breeding. Most of them are of heavy milk producing strains. If you want Short-horns of big size you can get them here. My Short-horns won all first prizes but one at the 1915 Beaver Dam Fair against heavy competition.

W. J. BERND - - - NEW RICHMOND, WISCONSIN

IMPORTERS AND BREEDERS OF

PERCHERON, BELGIAN AND CLYDESDALE STALLIONS AND MARES

WE now have in our barns more big-boned, rugged draft colts, from yearlings to 4 and 5 years, of the different breeds than ever before. We have two-year-olds that weigh over a ton—herd headers and show propositions.

Five farms over 1,000 acres devoted to the horse business. We do all our own buying and selling, grow all our own feed. Our economical way of handling stallions saves money for the purchaser. We guarantee all horses sold and can sell you a high-class stallion cheaper than any other firm in America.

We are located in North Central Iowa, 20 miles from the Minnesota line, on the C. M. & St. P. Ry., midway between Mason City and McGregor.

Send 20c in stamps for large Horse Hanger which shows our Main Farm and sales stables. Correspondence a pleasure. **We have a horse for every purse.**

JERSEY CATTLE.

She's The Money Cow

She makes use of every ounce of feed. Her milk is the richest of all the breeds in butter fat and solids. She is rugged and vigorous — will thrive in any climate. She milks steadily. She is beautiful and gentle. She's the mortgage lifter. She's the cow for the everyday farmer, yet she's the rich man's *pride,* too. And she's the cow for the family.

Our free book, "About Jersey Cattle," proves these things. Send for it now—a postal will do —it's interesting and instructive.

Registered Holstein Heifer

AND bull calves, three to ten months old. Some sired by King Clover De Kol Burke and sons by Oak Homestead Fobes, whose three nearest dams average over 30 pounds of butter in seven days. A few high-grade cows and heifers also for sale. Address
John North Kilbourn, Wisconsin

Let Me Send You This $5.00 Wool Horse Blanket FREE

To introduce my Stock Tonic to just a thousand more readers of this paper **I am going to give away** one thousand **beautiful Wool Horse Blankets—Absolutely Free**—I'll send them at once—**to the first thousand readers of this paper** who send in the coupon below. With this blanket I will also agree to send a big trial feeding of

Wilbur's Stock Tonic

the greatest of all live stock conditioners. What is more, I will send this Stock Tonic with the distinct understanding that it is to be **used for two months at my risk**—that if at the end of the two months feeding the Stock Tonic has not been entirely satisfactory **—no charge is to be made.**

I Will Prove To You

at my risk, that my Stock Tonic will positively **rid your stock of worms, fatten them up** and **keep them in pink of condition.** I will prove to you that with my tonic you will actually get **more milk from your cows,** that you will **fatten your hogs, steers, sheep and poultry for market in one-third less time**—that you will **save grain, prevent disease** and **make more money** from each animal you own. I will prove these things to you and I'll do it all at my own risk. And as a **special inducement,** to the first one thousand persons who send for this free trial feeding—**I will give one of the magnificent $5.00 Horse Blankets** shown above.

Send No Money! Just Mail The Coupon

There Is No Secret About This Tonic

It is composed only of the finest ground roots, herbs, etc.—each one carefully selected and absolutely pure—**Gentian, Elm Bark, Foenugreek, Charcoal, Anise Seed, Soda, Salt, Elecampane African Ginger, Wheat Middlings, Quassia** and **Blood Root**—the finest tonics, appetizers, digestive aids, worm dispellers and blood purifiers known to medical science. **Ask any veterinary about these ingredients.** Each one has a special purpose. A compound of these herbs, roots, etc., is absolutely sure to **help the digestion** of any animal—**keeps the blood clear,** the **system free from worms and disease** and forces the animal to **put on fat** rapidly. I have proved it so often I have no doubt about it. That is why I can make you this almost unheard of offer—to ship you a quantity of this tonic with the distinct understanding that **you don't pay a cent unless you are satisfied.**

I Take All The Risk

I have such absolute faith in Wilbur's Stock Tonic that I take all the risk in this trial feeding. **I know what it has done for others.** I have made and sold this tonic for over thirty-two years. Over a million of the best stock raisers in America are feeding it every day to their live stock—many of them have for over thirty years—I have thousands upon thousands of the finest kind of letters from all parts of the country telling me of the wonderful results from feeding this Stock Tonic. And now all I want is to show you **that what it will do for others it will do for you.**

The Blanket is Yours—FREE

It never costs you a cent. It is yours—forever—to keep and use every day—**whether you ever pay for the trial feeding of Tonic or not.** It is a big, warm, soft, wool blanket—84x90 inches—never sold for less than $5.00 to $6.00 anywhere. It's a blanket you'll be proud to own—and remember—IT'S FREE.

APPLICATION FOR FREE BLANKET

E. B. MARSHALL, President 1B
Wilbur Stock Food Co., 940 Huron St., Milwaukee, Wis.

Please send me at once one of your **beautiful $5.00 Wool Horse Blankets.** Also send me 100 pounds of Wilbur's Stock Tonic. I agree to feed the tonic for two months, and if it does what you claim, I will pay you for it at the rate of only $2.00 per month until I have paid $14.00. If it fails and I so report in sixty days, **you are to cancel the charge and I will owe you nothing.** You are also to ship me—Free—enough **Wilbur's Poultry Tonic**—your guaranteed egg producer—to offset all freight charges on the shipment. **It is understood that the $5.00 Horse Blanket and this pail of Poultry Tonic are to be mine—Absolutely Free—whether I pay for the Stock Tonic or not.**

Name _____

P. O. _____ State _____

F. O. _____ County _____ State _____

I own _____ cattle _____ horses _____ hogs _____ sheep _____ poultry.

I own _____ acres of land. I rent _____ acres of land. I am _____ years of age.

NOTE. This liberal offer only open to responsible farmers and stock raisers over 21 years of age.

Simply Fill Out The Coupon

SEND NO MONEY. Just find out by actual test on your own stock **—that my Tonic will make more money for you.** Just one thousand of these blankets will be given away. I have one for you if you send that coupon right away. You can't possibly lose anything—you have everything to gain. Isn't it worth a postage stamp?

Do it now—at my risk—fill out the coupon and mail it to me at once.

...ations with Berlin and ... Germany is satisfied ...greement which has pre... ...ndly relations with the ...tes without the humiliation ... the pres...

...paganda he is antagonizing his former chief supporter, Wm. J. Bryan. The main effort of the democrats thus far seems to have been to hit upon a candidate for vice president to supplant Tom Marshall, of Indiana, who is none too popular or strong as a running mate. The republicans and progressives are still up in the air, with Theodore Roosevelt holding the balance of power, but refusing to say just exactly what he will or will not do. Justice Hughes, of the United States Supreme Court, is still looked upon as a possible candidate, although he has repeatedly stated that he does not aspire to the honor and has ordered his name removed from the ballot wherever it has appeared. Senator Borah, of Idaho, also flatly declines to make the race, while Senator Weeks, of Massachusetts, is slowly but surely eliminating himself. Aside from Roosevelt, the men most frequently and prominently mentioned for the republican nomination are Senator Cummins, of Iowa; Senator McCall, of Massachusetts; and Senator Burton, of Ohio. All are favorite sons and will enter the convention with the support of their home states, far from enough votes to nominate, however. It is only a few months now until the nominating conventions are to be held, with more uncertainty as to the nominees and their chances of winning than usually prevails in the pre-convention campaign.

THE first steps in the campaign for national preparedness were taken by congress last week, party lines being obliterated and Champ Clark, speaker of the house, and James M. Mann, republican leader, working together. Two navy measures were passed without dissenting vote. One was to provide for adding 300 midshipmen to the entering class at the naval academy next July, in order to have more men in command of our ships, the other was to equip navy yards for construction of battleships now provided for. Immediate improvement of the navy by designing new battleships along the lines of the best now in use, doubling the membership of both Annapolis and West Point, creation of many additional regiments for the army and short term enlistments to produce a reserve, were among suggestions made by Champ Clark. He said he expected to discuss the subject of preparedness generally soon. Mr. Mann reiterated his previous pleas for a larger army and navy and aided in maneuvering the bills to passage. "This is not the time for crimination and recrimination," said he. "It is not the time to find fault with that which has been. It is the time for all to join hands for that which may come."

THE United States and Germany are reported to have reached a complete agreement on the settlement of the controversy over the sinking of the Lusitania and the sacrifice of 115 American lives last May. While concessions have been made by both sides, Germany is understood to have made the greater ones, practically meeting all of the demands of President Wilson. While refusing to admit that the sinking of the liner constituted an "illegal act" it is willing to make money reparation and to guarantee to take care of the lives of noncombatants on the high seas hereafter. Danger of trouble between the two nations, over this act, is now far removed. President Wilson believes he has won an agreement from Germany which eliminates forever the submarine menace to traveling Americans and that he has procured all the concessions that could be expected without adopting a threatening attitude which might lead to a breach of

OBJE... ...paredness p... ...y call for greatly en... ...s and navy, was made to the military committee of the lower house of congress last week by representatives of the National Farmers' Union and other national bodies having large and representative membership. Opposition to war preparations was voiced by John B. Lennon, treasurer of the American Federation of Labor; James H. Maurer, president of the Pennsylvania Federation of Labor; Mrs. Florence Kelley, Frank Dornblazer, a director of the National Farmers' Union, and Sara Bard Field of the California Women Voters' Association. Mr. Dornblazer said 2,000,000 farmers were behind a resolution he presented, demanding economy in the expenditure of funds, opposing an increase for an army or navy, approving a reasonable expenditure for coast guards and submarines, and objecting to a large standing army or compulsory military service. Miss Field attributed the opposition to preparedness, reported to exist in the middle West, to the advent of western women in politics. They realized the need of money for constructive things, she said, more than for war.

GERMANY continues to lose its colonies, being now well-nigh stripped of all its oversea possessions. Last week 900 Germans and 14,000 colonial troops from the German protectorate of Kamerun in western Africa crossed over into Spanish territory and were interned for the remainder of the war. While Germany has been wonderfully successful in its fighting in continental Europe it has been unable to hold its far-flung colonial possessions, the Japanese beginning the work by wresting the Chinese foothold away after a siege which promised to be exceedingly bloody, but which was ended by the surrender of the Germans. The campaign against Kamerun began in the spring of 1915. Kamerun has an area of 191,130 square miles and has a population of 2,540,000, including about 2,000 whites. The only other posesssion of the Germans in Africa, not conquered by the allies is the protectorate of German East Africa, which has an area of 384,000 square miles and a population of 5,500,000. The allies will hold all these conquered German colonies to use as counters, in the exchange of territory and advantages won, when the final peace accounting comes.

LINDLEY M. GARRISON, secretary of war in President Wilson's cabinet, resigned last week because of differences of opinion with the president over the preparedness plans, particularly as they apply to the absolute necessity of the proposed continental army of 300,000 men to serve three months each year for three years and then hold themselves liable to the call to the colors. The resignation has been accepted by the president, making the second break in the cabinet, Wm. J. Bryan having resigned the state portfolio because of differences of opinion on the Germany and war situations. Secretary Garrison was convinced that a new continental army should be organized, to supplant the national guard for defense, but President Wilson, while favoring the plan, has been informed that it will be impossible to force the matter through congress and has not insisted upon it. It is known that one of Secretary Garrison's principal reasons for his conviction that only a federal continental army ...stead of a reorganized national g... could be the main military depend... of the nation was his belief that s... day the United States may be ca... upon to defend the Monroe doctr... and in that event he foresaw the t... tional guard might not be available for use outside of the United States before a declaration of war. Upon the ...ntention on the one hand that the ...ntinental army or ultimately univer... service was the nation's only re...ance, and the position, on the other, that no one plan could be enforced upon congress, President Wilson and his secretary of war parted official ...any.

FAMILY CIRCLE TALKS
BY THE PUBLISHER

GEORGE WASHINGTON, FARMER.

IT IS interesting and stimulating to reflect that in our two greatest national crises, we have turned to the farm for a leader. Abraham Lincoln was born on a farm. He followed the life of the average farm boy until the law called him. George Washington was born on a farm (they called it a plantation in his days and location), he was brought up in the country and until manhood he had never seen a town of 5,000 people. There have been times when our nation seemed deaf and blind to the needs and the claims of the farm; in national stress it sees and hears with prophetic clearness.

With Washington's birthday occurring next Tuesday, it may not be amiss for us to consider the father of our country from the standpoint of the farmer. In recent years we have been enshrouding him too much in an historical mantle, making him a personage rather than a personality. I am indebted to a most interesting book, entitled "George Washington—Farmer," for restoring the real Washington to my mind, at least. I hope that when I have set forth a few facts here you, too, will be enabled to see our first president as he really was.

To begin with, no man thought more of farming and the farmer than Washington. Thus we find him writing to a friend, shortly after the war of independence:

> The more I am acquainted with agricultural affairs the better I am pleased with them; insomuch that I can nowhere find so great satisfaction as in those innocent and useful pursuits. In indulging these feelings I am led to reflect how much more delightful to an undebauched mind is the task of making improvements on the earth than all the vain glory which can be acquired from ravaging it, by the most uninterrupted career of conquests.

Do not these words take on a new and stronger meaning, now that we are asked to abandon the pursuits of peace and assume a warlike attitude? Can we not well afford to listen to Washington, the great soldier, the great commander, who, having whipped a never-before-beaten foe, turns from the victories of the battlefield to glorify the far greater achievements of improving the earth, making it to yield more abundantly? Let us think over his words before we quit the fields which we have trod with such credit to ourselves and comfort to the entire world.

On another occasion, Washington added this tribute to farming:

> I think with you that the life of a husbandman is the most delectable. It is honorable, it is amusing, and, with judicious management, it is profitable. To see plants rise from the earth and flourish by the superior skill and bounty of the laborer fills a contemplative mind with ideas which are more easy to be conceived than expressed.

Nor were these idle tributes, for Washington never found any greater pleasure in life, honored though he was, than to return to his fields and follow the farming life he loved so well. As a farmer he was progressive far beyond his time. Thus we find him carrying on experiments which seem childish to us today, in the zenith of our agricultural supremacy, but which showed an eagerness to learn in those days, when there were no farm papers, no agricultural colleges, no county agents, practically no outside aids to farming such as we have in such abundant measure today. Thus, in the fall of 1764, we find Washington sowing "a few oats to see if they would stand the winter." The author of the book which records this, aptly adds: "Any country boy of today could tell him that ordinary oats sown under such conditions in the latitude of Mount Vernon would winter-kill too badly to be of much use, but Washington could not know it till he had tried." The point was, he tried to make conditions better; sometimes he failed, but nevertheless he tried, repeatedly. Thus, we find him shifting from the culture of tobacco, which is exceedingly exhausting to the soil, to wheat, oats and corn; practicing rotation of his crops, using barnyard manure as fertilizer, experimenting with alfalfa and doing everything possible to improve farming conditions in the very beginnings of our national life, a century and a half before we topped the pinnacle of agricultural fame by producing crops of the annual value of ten billion dollars.

Nor was Washington a grain farmer only; the breeding and raising of horses, sheep and mules interested him intensely. During the revolutionary war he bought twenty-seven worn-out army mares for breeding purposes, and soon after he became president he bought thirteen fine animals for the same use, paying as high as $125 for the best, which was four times the prevailing price. In 1785 he had on his various farms a total of 130 horses, with other live stock in proportion. He was, by his own account, the first American to attempt the raising of mules, a jack and two jennets being presented him by the king of Spain. Later on in life he took increased interest in dairy cattle and hogs and rounded out a well-filled and honorable career by practicing almost every branch of farming as it was then known.

Thus, we see that the nation, which today leads the world in agricultural achievements, forecasted that supremacy by turning, in its first national stress, to a product of the farm and the field; a man who found no honor greater than that of making his acres yield more than his neighbors, who found it far more to be desired to improve his land than to ravage it with military conquests. Let us not depart from the principles of Washington, now that we have builded upon them such a superstructure of prosperity as the world has never seen before.

This, my friends, is the message I would leave with you on Washington's birthday: He who had beaten a great world power, who had won independence for a new nation, found in farming far greater comfort and far greater victories than were ever won by mortal man on any battlefield. Let us remember Washington's words and example, to the end that those who would lure us from the fields of peace to the blood-red fields of militarism may receive no answer to their frenzied cries.

THE PRICE OF GASOLINE.

THE price charged for gasoline is an important matter to farmers, in view of the fact that there are fully 1,000,000 gas and oil engines in use on the farms of America and an equal number of automobiles owned and operated by farmers.

I am not going to attempt to figure out exactly how much gasoline the farmers of America use in the course of a year, for that would be difficult and well-nigh impossible. I think we can get a fairly good estimate, however, without much trouble. There are now over 2,000,000 motor vehicles in use in the United States. In the ten states of the grain belt fully one-half of all the automobiles are farm-owned; this proportion does not prevail elsewhere, but we are fairly safe in assuming that one-third of all the motor cars in the United States are owned by farmers. This makes a total of 700,000 farm-owned cars, in round numbers. Statistics show that the average car uses about 500 gallons of gasoline a year, at which ratio the farmers of the United States buy 350,000,000 gallons of gasoline in the course of a year for their cars, to say nothing of the quantity necessary for their gasoline engines. Every time, therefore, that the price of gasoline is advanced 1 cent the farmers of America find their pocketbooks affected to the extent of thousands of dollars. When we stop to reflect that the price has been practically doubled in the last few months (filling stations, in town, sold gasoline for 10 and 12 cents last summer, whereas today it is 21 and 22 cents) the matter becomes one of serious importance.

In view of this state of affairs, I am glad, indeed, to see that one of our grain-belt congressmen, Mr. Dowell, of Iowa, has introduced a resolution providing for an inquiry into the exceptional flights the price of gasoline has been taking recently. Mr. Dowell's resolution (a copy of which I have just received from him) calls for a sweeping investigation by congress to see if the present prices are justified, or if they have been brought about by collusion between the companies and if prices are being fixed and manipulated so that the 2,000,000-strong army of automobile drivers is being forced to pay an exorbitant price, so that a few men may be unduly enriched. I hope congress will act upon Mr. Dowell's suggestion and never drop the matter until it discovers, once and for all, whether the farmers are being mulcted or are only paying such a price for gasoline as returns a fair and reasonable profit to the refiners and retailers.

I have seen a number of explanations offered for the rise in the price of gasoline, but I must admit none of them seem very tenable to me. One was that gasoline was being shipped extensively from the California oil fields, by way of the Panama canal, and the slides there, which stopped traffic for several weeks, held up a number of oil steamers and thereby reduced the supply. Another was that the severe storm at Galveston last summer cut down shipments from that port and those who know the oil situation know that Galveston and Port Arthur are two of the most important shipping points in the country. A third explanation was that one of the big fields in Oklahoma is yielding less abundantly than before. To my mind, no one of these explanations (nor all of them combined, for that matter) would warrant such a big rise in price, for the damage done by the Galveston storm has been repaired, the shipment through the Panama canal is but a small part of the aggregate oil movement, and Oklahoma never produced so much oil in its history as it did last year, fully 50 per cent of the high-grade oils of the world coming from that state. These explanations do not explain, in my opinion; they are interesting, but not convincing.

I sincerely hope the proposed investigation will go into all these matters thoroughly. I look for the price of gasoline to decline in the spring, but never again to reach the low price of last summer, when it was obtainable at 8 and 9 cents in sixty-gallon lots. But if a few men are holding up several million men, a third of the victims being farmers, the sooner we know it and put a stop to it the better.

SUCCESS OF CO-OPERATION.

I AM a firm believer in co-operation among farmers. Ends can be attained by organized effort which are absolutely impossible by individual and spasmodic effort. Therefore, whenever I see notable examples of co-operative success I propose to tell you about them. That I will have ready hearers I do not doubt, for nowhere has the co-operative movement made greater headway than here in the grain belt. Wisconsin has the honor to lead all the states in the number and strength of its co-operative activities, furnishing an example which other states might well afford to follow.

The latest report of co-operative success comes from the heart of the wheat belt in Kansas, where farmers who have organized a stock and grain company have not only realized 10 per cent on their investment, but the profits have been sufficiently large to enable them to declare a dividend of 1 cent a bushel on all the grain handled in the last year. The fact that since June, 1915, the company has handled more than 105,000 bushels of corn and wheat and twenty-four carloads of stock shows the extensiveness of the operations. The greater part of this 105,000 bushels of grain handled was sold by farmers who were not stockholders of the company. Many of them came for long distances, even passing other elevators on the way. Here is splendid refutation of the charge sometimes made that farmers cannot and will not hold together in an organization such as this.

The farmers' organization thus so signally successful was formed eight years ago to buck one of the old-line elevator concerns, and it was only a few years until the old-line company was glad to sell out and leave the farmers in complete control. Originally the concern was capitalized at $10,000, but last June the capital stock was doubled, the membership being increased to ninety. In 1914 the company had 243 grain customers and last year twenty-four more were added.

To me, there is something really inspiring about such a story, proving the farmer's capacity for extensive business effort. I have attended conventions of farmers and farm students and heard the argument repeatedly made that farmers would not hold to their agreements. I have always denied these assertions, but my opponents have demanded facts, rather than opinions. I am now well armed for them, for the facts which I have set forth here are indisputable. I have seen it estimated that fully 5,000,000 Americans are now directly or indirectly associated with various co-operative enterprises. I imagine if the exact figures were available a large percentage of this immense total would be found to be farmers and small-town people. It is here that co-operation is making greatest headway, with the prospects good for a greater number of converts within the next two or three years than ever before in our history.

James M. Pierce

THE WISCONSIN FARMER

A WEEKLY JOURNAL OF AGRICULTURE, HORTICULTURE, STOCK RAISING AND ALLIED INDUSTRIES

BY JAMES M. PIERCE

JAMES ATKINSON, Editor-In-Chief

ESTABLISHED IN 1848

Entered at Des Moines Postoffice as second-class matter

PUBLISHED EVERY THURSDAY

1912 Grand Ave. Des Moines, Ia. | 201 Washington Bldg. Madison, Wis.

To either of which communications relating to subscription or advertising may be addressed.

MEMBER AGRICULTURAL PUBLISHERS' ASSOCIATION
MEMBER AUDIT BUREAU OF CIRCULATIONS

SUBSCRIPTION RATES—Single subscriptions, $1.00 a year. In clubs of ten, 75 cents a year and an extra copy to getter up of club. In clubs of fifty or more, 25 cents a year. Single subscription three years in advance, $1.50; five years in advance, $2.25; ten years in advance, $4.00. Subscription prices in Canada, $1.50 a year. Remit by draft, registered letter, postoffice or express money order. In changing address, send both the old and new addresses. In renewing, give the same name and initials as you gave before or state both the old and new names, and explain why you make the change. In case of errors or failure to receive the paper within two weeks, promptly notify the publisher. Address WISCONSIN FARMER, MADISON, WISCONSIN

Reviewing a Year's Progress.

IN THIS issue The Wisconsin Farmer presents for its readers some of the good things which those who attended Farm and Home week at Madison were privileged to hear. It is not possible to review in a single issue all of the important matters which were brought up at this series of meetings and conventions arranged for by the Wisconsin College of Agriculture.

The attendance Farm and Home week proves conclusively that Wisconsin farmers and stockmen are deeply interested in their work. There is greater interest today in better grain farming and a higher grade of producing live stock than ever before. There is a great deal more interest in the farm home and in farm power than Wisconsin has ever known. The auditorium at the state college was filled for almost every address of the week. Wisconsin farmers look forward to a great year in 1916, and they are giving careful study to the best methods for making this year a more profitable one. The editors of The Wisconsin Farmer met many of their good friends at the Madison meetings, and we take this opportunity to thank all those who have assisted us by sending their papers and photographs. Almost every Wisconsin man with whom we had an opportunity to talk is a subscriber to The Wisconsin Farmer and is pleased with the rapid progress which this paper is making. For the many kind remarks along this line we are also very pleased and grateful.

As the oldest and largest Wisconsin farm paper, we feel a pardonable pride in referring to the fact that this paper in early days led the fight for such institutions as the Wisconsin College of Agriculture, the Wisconsin State Fair, and even away back, before the war, urged support for the first county agricultural fairs.

Starting Alfalfa on Sod Land.

ONE of our readers, Mr. J. Carter, of Freeport, Ill., who has purchased a farm in Green county, Wisconsin, inquires in the following letter about getting started with alfalfa on sod land:

I have bought a farm of 100 acres near Monroe. I want to get some alfalfa started as soon as possible. This field where I want to start it is now in pasture. Would it be advisable to break this field up and put barley on the breaking so that I might sow alfalfa this fall?

The best results on this pasture land can no doubt be obtained by turning it to corn this year or some other cultivated crop; followed by barley next year with which the alfalfa could be sown next spring. Of course, this would not give a crop of alfalfa either this year or next year, but the corn would be profitable this year; the barley would provide a good cash crop next year, and the alfalfa the following year would be well established and should yield at least three good cuttings.

It would be a mistake to try to sow alfalfa this year, as the blue grass in two or three years would crowd it out, regardless of how good the stand. So it will be best to plow it up this spring and cultivate it through this summer with corn or some other cultivated crop. This will give the sod plenty of time to rot and decompose and will insure the owner that the blue grass will not bother him in after years as it would if turned and sown to alfalfa immediately. By fall this ground should be in excellent condition and next spring barley and alfalfa could be sown together. The barley would be cut off during the summer, giving the alfalfa full sway and at the same time the barley would yield sufficiently to make the land pay while the alfalfa was getting its start. The following year, under this system, should find the alfalfa thriving nicely and a good stand would have been obtained.

The objection to this method may be that it takes two years before getting a cutting of alfalfa. Barley could be sown this spring, as Mr. Carter suggests, but there would not be the cultivation to decompose the old sod and the blue grass would creep in later on and tend to choke out the alfalfa. So we believe Mr. Carter and others with sod land wishing to start alfalfa can get the best results with alfalfa by cultivating the first season and sowing alfalfa the second season with a nurse crop which nurse crop nets a cash profit and at the same time affords protection to the tender alfalfa plants.

Much of the soil of Green county, like that in most counties, is acid and this acidity must be corrected if alfalfa is to do its best. Mr. Carter does not state whether his soil is acid or not acid but we would advise that he make the simple litmus paper test which will determine this point, and if it is acid arrange to correct this acidity before sowing the alfalfa. This is very easily and cheaply done and is worth far more than the expense.

The Wisconsin Farmer is pleased to receive these inquiries from its readers and welcomes Mr. Carter to Wisconsin. Alfalfa is a very important crop in Wisconsin and especially in a county like Green, where dairying is general. Every farmer should have an alfalfa plot and we are pleased to learn that Mr. Carter intends to devote some of his hundred acres to this crop.

The Relative Importance of Freight Rates.

IN A RECENT editorial we stated the need for active and intelligent co-operation on the part of the farmers of the grain belt in helping their public officials secure a fair and just regulation of railroad rates. The objection has been raised since then that the average farmer is not competent to understand or deal intelligently with so complicated and technical a subject.

On behalf of our many thousands of farmer readers we resent any such insinuation, for we believe that there is no question of public policy which the voters of this country cannot deal with fairly and efficiently or whose fundamentals they cannot grasp when properly presented. Otherwise our whole American system of government, with its belief in the intelligence and honesty of the average man, is a confessed failure.

The tariff question is a most technical one, but through its agitation every four years the farmer voters have come to understand its broad principles and to act as is consistent with their best interests.

How much more important that they should familiarize themselves with the fundamentals involved in railroad rate regulation! The total import tariff duties of the United States are only about 300 millions annually; the total railroad revenues reach the stupendous sum of 3,000 millions every year. The average tariff tax per capita, at the taking of the last census was $16.50; the average railroad tax per capita was $138.80. How much more it concerns the public's pocketbook, then, to see that the question of railroad rates is adequately and fairly handled than that tariff duties are properly adjusted! And yet we have campaigns of public education regularly fought over the tariff question, while the great mass of the people remain in densest ignorance of railroad rate matters.

A striking example of the relative importance of the rate question to every person was afforded by the testimony of Mr. Hugh L. Cooper in a hearing before the Interstate Commerce Commission involving a reduction in freight rates between Keokuk, Iowa, and Atlantic coast points. Mr. Cooper was the chief engineer in the construction of the great Keokuk dam, built at a cost of $25,000,000. He has had charge of the construction of more water power plants than any other three men who ever lived, and as such should be an authority on the relative importance of cheap power and low freight rates in manufacturing costs. He testified that the cost of power entering into the manufacture of such a representative commodity as flour was 1 2-3 cents per 100 pounds. In other words, a difference of only 2 cents per 100 pounds in freight rates was worth more to the manufacturing interests of Keokuk than the construction of the largest dam in the world at her very doors. Whether or not this dam was to mean anything to the people of Keokuk depended on their securing freight rates on an equality with Quincy, just across the river. Otherwise manufacturers could better afford to locate at Quincy, even if Keokuk were to offer them power absolutely free.

This is typical of the importance of rate regulation to the people everywhere, for freight transportation enters into the cost of almost every article of daily use and affects the pocketbook of every perosn far more than do tariff schedules. When the farmers of the grain belt grasp this fact, as they are fast coming to do, they will exercise the power which they possess for fair rate regulation. Then, and only then, will this great vital question be settled and settled right.

Wisconsin Man Says Live Stock Future Seems Bright.

W. K. CALDWELL, president of the Wisconsin Horse Breeders' Association, takes an optimistic view of live stock prospects in Wisconsin and in the nation. In a letter to The Wisconsin Farmer he discusses phases of the situation which will be of interest to every farmer of this state, and of special interest to our breeders. We quote from Mr. Caldwell's letter which reads in part as follows:

I firmly believe the brighest future awaits us in the history of the live stock industry of our country. The present prosperity of this vast country of ours, the principal object of which for the past decade has been the production of meat-producing animals, has been and now is severely handicapped in different ways. The prevalence of the foot-and-mouth disease all through the southern portion, has crippled not only the breeding but the feeding interests as well, the results are, the markets have been crowded with immature and unfinished stock, from nearly all the meat-producing sections. The vast northern section is having a somewhat similar experience, through the loss of the corn crop, and a lack of confidence of the people as to the future markets. In my opinion this is a plain case, of an alarming scarcity, and of higher prices of all meat-producing animals in the near future.

The prospects of the horse business is, I believe, as good and even better than that of any of the branches of the live stock interests. The coming of the automobile and the tractor as a detriment to the horse breeding business, I believe, has been greatly overestimated in the minds of the public. While the market for horses for the past year has been anything but encouraging, I believe the demand from foreign countries has come to the rescue, and is going to serve a twofold purpose, inasmuch as they are now taking vast numbers of the common class of horses, such as our markets do not demand, and when the disturbances in the foreign countries have subsided, those countries will then demand the best we are able to produce.

Therefore I honestly believe that the near future awaits us for much better prices, and an unlimited demand. I also think that these conditions are stealing in upon us, so to speak, unawares.

Milk as a Food For Growing Animals.

MILK is of great nutritive value as a feed for the growing animals on the farm and this point Prof. E. B. Hart dwelt upon in his address last week at the Farm and Home course at Madison, Wis. Professor Hart is one of the most fluent speakers connected with the college of agriculture and his address was a treat to those fortunate enough to hear him. His subject was "Milk and Animal Nutrition," and having conducted numerous experiments, he spoke with much ease and authority.

Prof. Hart's explanation of the suitability of the mineral content of milk for the growing animal emphasized the use of the skim milk on the dairy farm for feeding and the necessity of the farmer selling only high-testing cream with the desire of keeping as much skim milk on the farm as possible, and a hundred pounds of skim milk has half the value of a bushel of corn as feed and the farmer who skims thin cream is wasting a lot of valuable nutrition the growing animals require, in addition to hauling more bulk to his creamery than necessary. Professor Hart pointed out that there are in milk distinct growth-promoting substances which are in such liberal concentration as to make this article of food especially adaptable to growing stock and that the farmer cannot afford to waste it. He also pointed out the dangers from selling too closely the milk supply of the farm into the various industrial outlets, such as cheese manufacture and city milk, emphasizing this from the point of view that the young growing animals need proper care and nutrition if Wisconsin is to have strong animal breeding centers.

Drainage Lessons For Wisconsin Farmers.

UNDER direction of E. R. Jones, drainage expert, demonstrations were given at Madison Farmers' week. The first demonstration showed the use of the grade lath in obtaining a true grade line for tile drains. The second consisted of blackboard demonstrations of the methods of laying out drainage systems on different kinds of wet lands. A gasoline power trenching machine dug a trench in frozen ground on the University Farm as a special feature supplementing the exhibition. From Mr. Jones' remarks on the demonstration field and in the class room, we gained valuable drainage facts of interest to every farmer in Wisconsin.

Every farmer should know something about testing the grade lines of his drains. The grade lath method, explained fully in Bulletin 229, is very simple. After the grade laths are set in a line exactly five feet above the grade line and parallel to it by sighting over a stick five feet long, both farmer and tiler can tell whether or not the trench is dug to grade. This is particularly desirable during a dry season when no water occurs in the trench to act as a guide. Whenever there is a doubt as to the amount of fall in the line of grade laths after they are set, a careful test should be made with a level. Get a surveyor to use an accurate level wherever it appears that the fall is small.

Every farmer should have some notion as to how the drainage system on his land should be laid out. Many of our best drainage systems are laid out by a farmer himself, but in almost every case after a system is laid out, it is well to have an engineer test the doubtful places in the system.

Eight to ten typical areas were sketched upon the blackboard and drainage systems were laid out on these areas before the eyes of the farmers witnessing the demonstration. Many of these drainage systems were put in as sketched. Where parts of them have proved less successful than they should, the reason was explained.

On areas having a tight clay subsoil, tile usually

have to be four rods apart and not over three feet deep. On peat soils, tile should be four feet deep or more. It is better to have four or five lines of small tile discharged into a main which has a single outlet than to give each small line of tile an independent outlet. On springy areas if a line of tile can be laid between the spring and the hill from which the water comes, it will intercept the seepage and less tile will be needed than if the seepage is not cut off. On a low flat marsh with a creek running through it it is best to dig an open ditch toward the higher marsh until a ditch four feet deep can be secured. Then let the tile discharge into the end of this ditch. Such a device is known as a makeshift outlet.

The tiling machine is a new feature of demonstrational work at the college. Mr. Jones believes that the tiling machine is a big help in solving the drainage problem in Wisconsin. Tile can be laid more quickly with a machine and frequently time enough is saved to save a crop and thus pay for the tile.

Hand labor will often be required in the wetter, softer and stonier areas. For this reason it is desirable to train practical tilers in the use of a surveyor's level. A tiler who understands the use of the level and can set accurate grade sticks should command wages 25 per cent higher than a man who knows nothing about the use of such an instrument and is apt to do careless work.

Cover Page of This Issue Drawn by a Wisconsin Farmer.

GENERALLY speaking, we always have a little heart-pang when a good, successful farmer branches out into other lines and makes a conspicuous success. But we know that this great country which is first of all an agricultural country, must annually recruit thousands of men and women from the farm, for business for political life and for the furtherance of the arts, crafts and sciences. While our doctrine is that in most cases it pays to stay on the farm, we know that our country needs and must have a great many of these people, of strong body and clear mind, for other walks in life. The cover page of this issue was drawn by a farmer, and those who will take another look at it will see that Frank J. Eslinger, of Winnebago county, Wisconsin, can work very cleverly with other tools than pitchforks, hoes, plows, etc. Mr. Eslinger has the real artistic sense, and there are many students at the art schools who would be glad to claim authorship to this cover page. Mr. Eslinger has been studying drawing and penmanship for several years and has had forty-two separate exhibits of his work at the Winnebago, Wisconsin, county fair the past two years. He has won thirty-five prizes and his home friends regard him as considerable of an artist.

The Wisconsin Farmer takes pleasure in calling attention to the good work of a farmer-artist and we congratulate him on his effort. It is our hope that he may make as much of a success with his farm tools as he has accomplished with pen and brush. Mr. Eslinger writes us that the successes he has had have encouraged him and we shall not be surprised to learn of greater achievements in the future.

Wisconsin Honors Dr. Babcock.

THE present governor of Wisconsin, Emanuel L. Philipp, remembers the time when a farmer boy in Sauk county, that all farmers made butter and took it to the village store where it was deposited in a common barrel. In this barrel there was butter of various colors, of varying degrees of saltiness. There was good butter and bad butter and butter that was even worse. On a hot day this butter would melt and run together. Butter thus gathered could be shipped only in cold weather because there were no refrigerator cars. The first refrigerator car was brought to Wisconsin in 1873 and prior to that time there was no opportunity to dispose of dairy or other perishable farm products save in such weather as was favorable for their preservation.

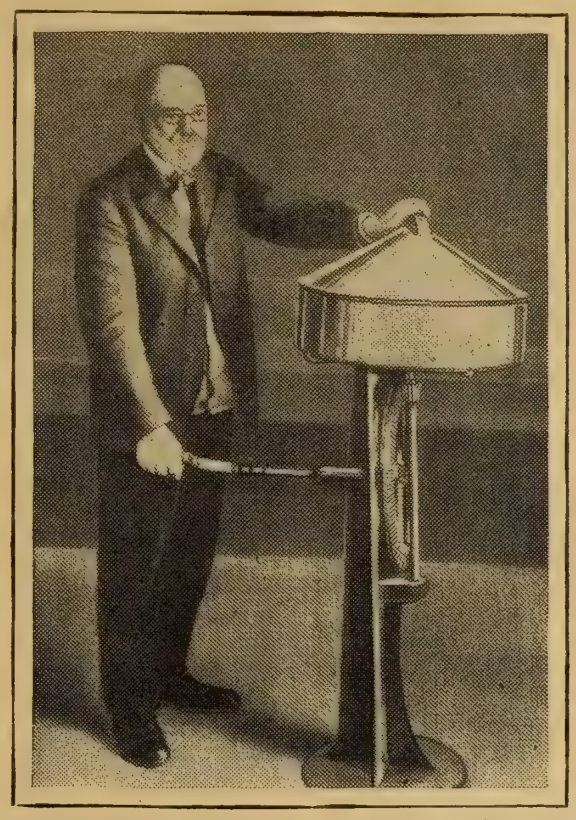
Dairy progress in Wisconsin has been marked since the invention of the Babcock test in 1890. Three great steps in dairying were discussed at the Babcock testimonial banquet in Madison last week, viz., the organization of creameries, the application of centrifugal force in the separator, and the discovery of the Babcock test. While these events stand out most prominently in the dairy world, events as they have influenced dairying in Wisconsin were particularly enumerated as follows:

1841—First co-operative factory in the state.
1846—Swiss cheesemakers arrive in the state.
1872—Wisconsin Dairymen's Association organized.
1873—First refrigerator car service for dairy products.
1885—Invention of the rennet test.
1889—State Dairy and Food Commission established.
1890—Invention of the Babcock test.
1893—Wisconsin Cheesemakers' Association organized.
1895—Cold curing of cheese first advocated.
1898—Invention of the Wisconsin curd test.
1898—Filled cheese law passed.
1900—Southern Wisconsin cheesemakers organized.
1901—Wisconsin Buttermakers' Association organized.
1907—Hart casein test invented.
1907—Wisconsin butter moisture test invented.
1910—Sediment test introduced throughout the country.
1910—Pasteurized milk cheese perfected.
1916—Cheesemakers' license law put into practice.

The old-timers remind us that Wisconsin was originally a wheat state and that such an unwelcome visitor as the chinch bug, destroyer of the wheat crops, forced the farmers to turn their attention to other lines.

Prior to the discovery of the Babcock test there was no practical way to measure the butter fat in milk. Buyers had no way of telling, save by long and laborious methods, whether milk had been partly skimmed or not. The farmer who provided poor milk got as much for it as the farmer who provided milk rich in butter fat. This system was worse than it would be to sell calico without a yardstick or coal without weights. One may guess with a reasonable degree or accuracy on measuring a yard of cloth, or a ton of coal. But it has never been easy to guess the quality of milk by the sight test. Dr. Babcock's invention put an absolute and infallible rule on butter fat measurement, and for the first time it gave an easy as well as accurate system of measurement.

Dr. Babcock's service to the state and to the world of dairying, cannot be overestimated. The striking feature of this service is that it was done without thought of personal glory or promise of financial reward. Dr. Babcock is spending the autumn of his life in research work at the Wisconsin College of Agriculture. He is still youthful and happy in this work. He was in his prime when Dean Henry was in charge of the College of Agriculture and Governor Hoard was just opening the eyes of Wisconsin farmers on the possibilities of dairying. It was one of the ambitions of Dean Henry when he was in charge of the state college staff, that Dr. Babcock should succeed in perfecting a butter fat test and give it free of charge to the world. Dr. Babcock's invention, had it been retained as a personal asset, would have netted him hundreds of thousands of dollars. One big commercial firm has figured that Dr. Babcock would have been several times a millionaire, had he received only a small royalty on every tester which has been made and sold. The tester would have been no less a marvel had it been commercialized by its inventor. But the inventor might long since have been lost sight of. The personal sacrifices of time, of pleasures, of money, enter largely into the spirit which prompted the recent anniversary celebration at Madison, and the tremendous ovation given to Dr. Babcock.



DR. STEPHEN MOULTON BABCOCK AND THE ORIGINAL BABCOCK TESTER.

Making Wisconsin Fruit Profitable.

THE test for anything progressive in agriculture is whether it pays. This may sound a bit sordid, but it is true. As a general rule, the test which is applied to anything new on the farm, any "new fangled idea," is whether it pays in dollars and cents. There are a few things in farm life to which, we realize, there may be applied a loftier test, as for instance the improvements in the farm home which do not show up so directly in cash returns, but which do, in most instances, give a greater return in comfort and happiness, than can be gotten out of cash in the bank.

The test of "whether it pays" must eventually be applied to all lines of activity suggested by the state departments for farmers, and especially to those very important operations suggested for the farmers by the departments of the experiment station. There are a good many farmers who look with some degree of allowance upon what "the professors" have to suggest. But we dropped the word "professor" in Wisconsin a long while ago. We refer to the use of the word as it has in times past been applied to experiment station men. These men are merely students of farm problems. They work under a little more favorable circumstances usually than the farmer, for the reason that they have a salary which is certain and which the farmers by the way help to pay.

R. H. Roberts, of the horticultural department of the college of agriculture, has given The Wisconsin Farmer some interesting facts concerning the work of this section of the Wisconsin station. He says that one of the most pleasing results of this work is that the fruit from experimental orchards in the state has brought good prices this year. And this has certainly been a poor year for fruit—unless the fruit was especially good. It is a rather interesting situation when farmers report that "apples went to waste because they were not worth picking," and at the same time come into the middle of winter and can't get apples for less than $2 a bushel. At least this is the price to the consumer from the retail stores. But the apples we buy now are apples which, at picking time, were suitable for storage; apple without scab or worms. Such apples never fail to bring a fair return on the investment.

The results obtained at the state orchards this summer were co-operative and were due largely to proper spraying methods. In these orchards the owners urged state experts to adopt the most modern spraying methods and the demonstrations were witnessed by many farmers and fruit men. Apples from these orchards sold at $1.00 to $1.25 per bushel. Mr. Robert tells us that if all the time and material is charged against the clean fruit which is normally scabby and diseased on the unsprayed checks without considering the benefit to the tree of having its foliage clean and healthy, the cost ranges from nine to eighteen cents per bushel.

Under average conditions these were results that could be obtained on every farm orchard. The small scab and sooty mold spots on apples from unsprayed or poorly sprayed orchards so detract from the appearance and keeping qualities of the fruit that it has little value. Many farmers who are acquainted with these troubles do not realize the true low value of their fruit and complain annually of having no market for their apples. But the co-operators of this season can all testify to the efficiency of careful spraying at the right time as a means of having fruit that is demanded on the market.

So the horticultural work is demonstrating its value under the dollars and cents test. Mr. Roberts will be glad to communicate with any farmer in Wisconsin who is interested in the better and more profitable way of raising fruits.

Increase in Price of Milk and Cream

COMPARISON of prices which the Wisconsin dairy farmers are receiving today for their cream and milk, as compared with the prices they received twenty-five years ago were made by Prof. E. H. Farrington of the dairy school at the Farm and Home course in Madison. As the cost of feed has increased, so has the selling price of the cow's product, until today the farmer is getting an average of from 30 to 35 cents for butter fat, when a quarter of a century ago he was receiving only 22½ cents. In those days when the Babcock test was just being inaugurated and was a new thing with dairymen and factory operators, milk was bought at the rate of ninety cents per one hundred pounds for four per cent milk which Mr. Farrington explained was at the rate of 22½ cents for butter fat. Some creameries in the state have paid as high as 39 cents this winter, but of course the summer price brings the average down. Just what the average for the state is is not definitely known, but the farmer by remembering that in April, 1890, his fat was only worth 22¼ cents, can easily ascertain the increase by comparing with the prices he gets today.

Mr. Farrington's address was along the lines of the improvement in dairying conditions over a period of twenty-five years, and in this prices were given consideration. It was especially interesting that the observance of the twenty-fifth anniversary should also mark the realization of the highest prices that have ever been received in Wisconsin for cheese. Cheese that is now in demand at 18 cents a pound was bringing only 12 cents twenty-five years ago, and it is predicted that the prices will go over 19 cents within a few weeks, as the stocks are moving fast and the demand very brisk. During the first week in February the price of cheese on the Plymouth and Sheboygan boards averaged 18¾ cents and several lots sold at 19 cents, so it is noted that as this industry in Wisconsin has grown to be a $30,000,000 industry, the price of the product to the consumer has gradually increased. The war has had much to do with this high price of cheese, as it has kept much of the Canadian product out of the American market and at the same time has caused large exportations from Wisconsin to the warring nations. These high prices of course benefit the farmer, and the increase in the value of the milk and cream, as outlined by Mr. Farrington is, of course, regulated by the selling price of the manufactured product—cheese and butter.

Mr. Farrington also gave some interesting figures on butter production and pointed out that the richer the cream the greater the overrun. Therefore, it is to the advantage of the creamery operator to have his patrons deliver him high-testing cream as it will make more butter per hundred pounds of fat. Cream testing 40 per cent has an overrun 1 per cent greater than cream testing only 20 per cent.

Grain Growers' Splendid Meeting.

Wisconsin Experiment Association Holds Its Annual Gathering at Madison With an Attendance of More Than 500.

THE seed corn situation; smut in oats and the values of fertilizers in increasing Wisconsin's grain crops received much attention at the annual meeting of the Wisconsin experiment association at Madison last week. More than 500 members, most of whom were grain growers, attended the business session on Saturday, and three times that number were present at the addresses and moving picture demonstrations on Friday.

Henry Michels, of Malone, was re-elected president and Prof. R. A. Moore, of Madison, was again honored with election as secretary. J. R. Thorpe was elected vice president and H. E. Krueger, of Beaver Dam, was chosen treasurer for another term.

The meetings were full of enthusiasm. The corn and grain show held in the live stock pavilion during the week proved to be the best ever held and the joy of the exhibitors was reflected at the business sessions of the association. Secretary Moore reported that the membership has grown steadily and that at the end of the year the association had a paid up membership of 1,446. New county orders are being formed all the time, Waushara county being the fiftieth in the state to organize, and Secretary Moore urged that all state members feel that they stand sponsors to the county associations and help them in every way possible.

The seed corn situation received much consideration, not only in the report of the secretary but also by several speakers. W. H. Hanchett, of Sparta, discussed this matter from the practical farmer's standpoint and said that 75 per cent of the farmers in Wisconsin were facing two questions:

First, where to get good seed corn for next season's planting.

Second, what variety will be the safest to buy.

Mr. Hanchett said that there is considerable indifference manifest at this time, which he said is a mistake. He warned the farmers to exercise extreme care that seed corn is of a strain that will mature in Wisconsin. In his own case Mr. Hanchett said that he will tie to two varieties: Golden Glow for crib corn; Silver King for silage.

Mr. Hanchett added that there was some sentiment with him for these varieties, but long experience had proven them absolutely reliable. Golden Glow on his farm in the average season is ready to shock by September 1st, and gives the maximum of good, sound corn for the crib. Silver King, under the same conditions, is ready for the silo by September 15th, and he believes will produce several tons per acre more good silage than any other variety he has tried.

The efforts of many to make great money out of seed corn he criticised and urged careful selection by the farmers. In the matter of seed he said the Wisconsin farmers were more fortunate than those of most states, as the state association grasped the situation last fall and saved much good seed from members who were fortunate to mature enough good corn for seed. Mr. Hanchett also believes the shortage will have one good effect—it will stimulate the planting of pedigree seeds as the scrub varieties mostly failed, and most of the seed is of the pedigree varieties. This will start many farmers into pure-bred corn who otherwise would have stuck by the scrub varieties. Noyes Raessler, of Beloit, spoke of the value of soil management for seed corn production; Prof. George B. Mortimer discussed Sudan grass in Wisconsin and Ben Faast, of Eau Claire, told of the splendid opportunities in Upper Wisconsin, emphasizing the need of better co-operation between the commercial interests and the farmers. Prof. H. G. Bell, of Chicago, discussed "Science and Soil," illustrating by lantern slides the value of fertilizers, etc.; and H. T. Draheim, of Richland county, a big winner in the state grain show, told of growing and preparing grains for exhibition.

Secretary Moore, in his report, took up the activities of the association during the last year and reviewed the increased interest in pedigree seeds. The local demand and the demand from sister states for pedigree seeds of all kinds has been better than ever, although the war has cut down the foreign demand. Secretary Moore also revived the success of the Wisconsin grains and corn at the Panama-Pacific Exposition and afterwards Mrs. Adda F. Howie, of Elm Grove, who was in attendance at the exhibit, was extended a vote of appreciation and made an honorary member of the association.

Speaking on the activities in pedigree grains and the seed corn situation, Secretary Moore said:

For the first time this year there seems to be a desire on the part of some of the membership to boost prices beyond all reason on seed corn simply on account of the unfortunate conditions which obtained last year. The member should realize that mostly all of the buyers of seed corn are farmers like himself and there should be no attempt to take advantage of the situation by charging double and treble the price that seed corn usually sold at.

Many calls for seed have already come to the office and lists of our growers sent to such parties. In many instances these same parties have written me to the effect that some of our growers would not even set a price on their seed and others wanted prohibitive prices which made it necessary to purchase elsewhere. It should be remembered that at the present time there are over 25,000 bushels of seed corn to be sold in the hands of our growers and more is being listed each day. We are not in the seed business for a season merely, but for a lifetime perhaps.

It seems reasonable this year that the grower should have a higher price for seed corn than in previous years, as it required more labor to secure and fire-dry it. While the association makes no attempt to fix prices of products grown by the members, yet I feel that a good fair price to growers and buyers alike for good select ear corn would be $5 per bushel and $4 per bushel if shelled. This is to be sound, high-testing, pure-bred corn. Where a member is required to select sample ears for judging or for breeding plot an extra price can always be charged.

More criticism than ever before has come to the secretary to the effect that much smut developed in the oat crop this year that was sown with seed oats that had been purchased from our members. This leads me to believe that our members are not as careful as they should be in the treatment of seed for the prevention of smut. The association will demand for 1916 that all seed oats and barley sown should be treated. The treatment is so simple and effective that there is no valid excuse for not treating the seed sown upon the farm.

We desire to have all seed oats sacked loosely and submerged for five minutes in a solution made by pouring one pint of formaldehyde into thirty-six gallons of water. For barley, submerge two hours. The time saved by having a large quantity of solution made up for the treatment will more than offset the extra cost for formaldehyde. After treating the grains they should be emptied on the barn floor and covered for two hours with canvas or blankets so as to make the treatment entirely effective.

Swine Breeders Discuss Big Sale.

Poland China, Duroc Jersey, Berkshire and Chester White Associations Hold Annual Meetings at Madison.

SWINE week, to be held probably during Farm and Home Week, 1917, was a topic of great interest at all the swine breeders' association meetings. The proposal is to hold a big combination state sale, probably in the live stock pavilion, and if these plans are carried out it will doubtless bring together more Wisconsin swine men than have ever met together before.

The Wisconsin Poland China Breeders' Association approved the proposed sale and duplicated the special premiums it offered for the state fair at Milwaukee, the Northern Wisconsin Fair at Chippewa Falls, the Interstate fair at La Crosse and the Sauk County Fair at Baraboo last year. The association by duplicating these specials expects to keep up the interest of Poland China breeders in exhibiting their herds and it is probable some other fairs will be granted special money.

The association also decided to aid the state pig contest which is being fostered by the boys and girls' club department of the college of agriculture and offer additional prizes to the winners to those already offered by the state fair. This pig show will be in connection with the 1916 state fair and where the winner is a Poland China the association will offer speci l prizes. The details were left to the secretary to work out. It was also decided to continue the Poland China futurity at the state fair, as it was the consensus of opinion that this has done much to increase interest in the breed in Wisconsin.

Robert Smiley, of Albany, was chosen president to succeed M. Madson, of Madison. Burley Dobson, of Lancaster, was elected vice president and J. F. Diley, of Rush Lake, was again chosen secretary. L. P. Martiny, of Chippewa Falls, and Albert Madson, of Madison, were chosen members of the executive committee.

J. L. Tormey, of Madison, addressed the meeting on market conditions. He endeavored to explain the cause for low hog prices and said that many farmers were complaining because they shipped their hogs in poor condition when they could only command a poor price. Some Wisconsin counties, he said, were stripped of market hogs and this situation prevailed in many other localities. Hog receipt records at the markets were broken in December. Prices averaged $7.10 last year, which struck about the ten-year average. This was $1.20 lower than the 1914 average and $1.25 lower than the 1913 average. The market was best in October and poorest in December.

About twenty-five breeders were present at the annual gathering of the Wisconsin Duroc Jersey Breeders' Association, which approved the plans for swine week and appointed a committee composed of E. H. Parker, of Janesville; J. D. Gant, of Delavan, and F. R. Constance, of Waupaca, to perfect the arrangements for a sale next winter. The members were divided over whether it would be best to hold the sale during farmers' week or the week following so the committee was empowered to take the proper action.

M. F. O'Keefe, of Waunakee, was re-elected president; F. R. Constance, of Waupaca, was chosen vice president, and Mr. Gant was honored again with election as secretary. John L. Fisher, of Janesville, and J. C. Bolger, of Waterloo, were elected members of the executive committee.

The matter of holding a Duroc Jersey futurity at the state fair this year was discussed and universally approved. Several breeders nominated their herds and it is believed it will be possible to secure the necessary twenty nominations in order to secure the $400 which will then be available. There will be twenty-four prizes and no better means of boosting the breed could be secured, members believed, at the same cost. A committee to arrange the futurity was named consisting of Mr. Fisher, Charles Burt, of Brodhead, and L. F. Atwater, of Bangor.

Secretary Gant reported on the failure of the association to hold its consignment sale at Madison last winter because of the foot-and-mouth disease and afterwards a resolution expressing thanks to The Wisconsin Farmer for donating the advertising was unanimously adopted. The association, expecting to hold the sale, did some preliminary advertising, expecting to pay for same out of the proceeds of the sale. When the sale was called off The Wisconsin Farmer cancelled its bill, as the association was without funds to meet such a bill. This the members appreciated very much, especially as it was the only farm paper to grant this concession.

James Fisher, of Eastman, was re-elected president at the annual meeting of the Chester White Association. This meeting was attended by about fifteen enthusiastic breeders and William F. Belda, of De Forest, was elected vice president; A. H. Kuhlman, of Madison, secretary-treasurer, and Leon J. Delahant, of Green Bay; Herman Liemer, of Watertown, and Alfred Kirst, of Tomah, members of the executive committee. There are about eighty members of the national record association in Wisconsin and an effort will be made to get all of these into the state association. Interest in Chester Whites has come very fast during the last five years and new herds are being established every year in Wisconsin. The association decided to encourage the pig contests among the boys and girls by offering specials to the winners at the state fair if they happen to be Chester Whites and also arranged for specials for the regular state fair exhibitors. Mr. Eastman spoke briefly on why he likes the Chesters and said that in his belief it is the coming breed, as the Chester brood sow is a large producer and the pigs have the size and quality. He believes a farmer can start with a forty-pound Chester pig and make more money than with any other breed. The secret of the hog game, he said, is to do away with the sows that farrow two or three or four pigs and when the farmers learn this they will turn to the Chesters which are large producers and good milkers so that they can care for large litters.

Several important matters were discussed by the Berkshire breeders at their annual meeting. H. C. Taylor, of Orfordville, was again chosen president; George Kelley, of Mineral Point, was elected vice president, and W. A. Freehoff, of Waukesha, secretary-treasurer. Burton Peck, of Spring Green; W. D. Becker, of Fort Atkinson; A. P. Cortte, of Lomira, and George Clark, of Janesville, were elected to the executive committee.

The association discussed a statewide Berkshire pig-feeding association to increase interest in the breed and also an advertising campaign for the same purpose. J. H. Kitchen, of Eldorado, the retiring secretary, suggested some kind of an advertising campaign to help the young breeders and the secretary was instructed to work out a good plan. An effort will also be made to send a car of Berkshires to the national show in Omaha next October in order to show the world the kind of Berkshires this state is producing.

The Farmers' Co-operative Creamery at Clear Lake, Polk county, another of the large creameries of the state, did a business last year that amounted to $233,029 and gained 113,000 pounds in butter manufactured over 1915. This creamery recently moved into a new building that cost $16,870 and is said to be one of the finest in the state. Interesting items from the annual report are:

Milk received	254,357 lbs.
Cream received	2,594,178 lbs.
Average test of milk	3.766%
Average test of cream	25.4 %
Butter fat in milk	9,580 lbs.
Butter fat in cream	659,970 lbs.
Total butter fat	669,550 lbs.
Butter shipped (net)	772,427 lbs.
Butter sold patrons (net)	26,158 lbs.
Butter sold to stores (net)	12,525 lbs.
Total butter made (net).	811,110 lbs.
Net gain over 1914	113,935 lbs.
Av. overrun for year	21.1%
Av. net price obtained for butter	27.82 cts.
Av. net price paid for butter fat	30.8 cts.
Av. cost of making one pound butter	1.58 cts.
Rec'd for butter shipped	$214,336.75
Rec'd for butter sold patrons	7,560.65
Rec'd for butter sold in Clear Lake	3,798.25
Cash on hand December 31, 1914	3,478.42
Paid patrons for butter fat	206,866.25

The Ellsworth creamery, at Ellsworth, Pierce county, which has had under consideration the establishment of a co-operative laundry in connection therewith, has dropped the project after an investigation by E. W. Campbell. Mr. Campbell, who visited the laundry at River Falls, said that the cost would be at least $5,500 and that the laundry would have to have 500 regular patrons to prove profitable. The contract for buttermilk for the coming year was let at an average price of 33 5-8 cents.

F. F. Showers, one of Wisconsin's best farmers, says that he can keep a cow to the acre and make a profit of $72 per head. He doesn't pretend that he can do better than others.

Twenty Thousand in Club Work.

Agricultural Clubs in Wisconsin Given Added Impetus by Special Awards to Be Given at the State Fair.

CONSIDERABLE impetus to the boys and girls' agricultural club work in Wisconsin should result this year from the co-operation of the state fair, which will give $3,500 in premiums at the fair this fall in order to make this work statewide in importance. The fair board has just announced the preliminary plans for the state contests, etc., which will be held during fair week, September 11th-15th, in connection with the young people's agricultural exhibits.

The boys and girls' department was added to the state fair last year and proved so successful that this department has been greatly enlarged for this year and includes all the agricultural activities in which the boys and girls of the state are engaged.

Something like 20,000 boys and girls are interested in agricultural work in Wisconsin. Some are growing corn in the various county and community contests; others are growing grains; some are raising dairy calves, beef calves and swine; hundreds of girls are interested in tomato clubs, garden clubs, horticulture and other lines of agriculture. This work has been growing rapidly during the last few years and the encouragement which the state fair gives by putting up such a sum should cause many more thousands of farm boys and girls to become interested in this work.

The regular premiums announced amount to $1,500 and special premiums total $1,000. In addition a surprise premium of $1,000 is to be announced later and this department will be a great educational feature. This boys and girls' club work is a very important undertaking and the net result of the state fair department will be to make it statewide in character, for there will be prizes for the champion corn growers, champions of all classes, etc.

Heretofore, the interest in these boys and girls' corn, calf and similar contests has been entirely local. Now they will be just as interesting locally and in addition the boys and girls will get together from all the counties at the state fair in Milwaukee and fight for the honors. This gives state recognition to a work that is highly effective and because of this recognition many boys and girls will become interested who would not take part in the purely local affairs.

There are seven divisions of interest to the farm boys and girls. They are the school and club exhibit, field and garden exhibits, calf club exhibits, pig club exhibit, poultry exhibit, stock-judging contest and horticultural contests.

The school and club exhibit will be open to organized clubs and premiums are offered for club displays of corn, potatoes, calf, pig, poultry, garden, canning, sewing and baking.

The field and garden division is open to any boy or girl in the state and premiums are offered for the best ten-ear sample of corn, the best pecks of early and late potatoes, the best pecks of oats and barley, the best-cured bundles of alfalfa and for garden stuff. The cash prizes in this division total $152.

Considerable interest in calf raising should develop through the offering of $177.50 in cash in addition to specials to be announced later. This exhibit is for boys who have selected, fed and kept an accurate record of a calf-feeding experiment and as many of these experiments are now being started this should prove a very profitable department. Dairy and beef breeds are included.

First prizes of $10, second of $7, third of $5, fourth of $3 and fifth of $1.50 for Holstein, Guernsey and Jersey pure-bred or grade heifers and also for pure-bred dairy bull calf, all under eight months, are offered. For beef bull calf the first prize is $15, second $10, third $7, fourth $5, fifth $3 and sixth $1.50. In addition there will be a first prize of $15 for the champion dairy heifer under eight months of any breed and the champion pure-bred dairy bull calf of any breed.

In the pig division there are offered prizes ranging from $5 for first down to $1 for fifth for the best boar and also best sow in Polands, Durocs, Chester Whites, Berkshires and Tamworths and premiums ranking from $10 down for the grades and cross breds of the large type. There will also be championships with $10 offered for each of these—grand champion boar, any breed; grand champion sow, any breed; grand champion grade or cross bred.

Eighty dollars has been offered in the poultry division for the boys and girls and $273 has been put up for the stock judging which is open to teams of three each. There will also be sewing and baking contests for the girls.

In addition to the apple exhibit there will be apple judging and identification contest for the exhibitors. A total of $101.50 is offered in this division.

Four state championships will also be awarded for which special premiums will be given. They are:

1. Champion Boy.—This premium will be won by the boy showing the highest score and average.
2. Champion Girl.—This premium will be won by the girl showing the highest score and average.
3. County Champion.—This premium will be awarded to the county the clubs of which make the highest score and average.
4. Club Champion.—This premium will be awarded to the club making the highest score and average.

The boys and girls' exhibits will be held in the amphitheater arcade which will be greatly enlarged this year and will be large enough to properly care for the exhibits. The state fair officials are also arranging with the Milwaukee Y. M. C. A. to take charge of an emcampment so that the boys and girls who attend the fair can camp on the fair grounds at moderate cost.

The fair authorities are co-operating with the boys and girls' club department of the college of agriculture and the state department of public instruction and bulletins giving the details can be secured from any of these organizations. The directors and others in charge are:

Board of Directors.—Chairman, Thomas L. Bewick, Madison, state leader boys' and girls' agricultural clubs, United State Department of Agriculture; H. N. Goddard, Madison, state department of public instruction; J. M. Gahagan, Milton, superintendent of city schools; W. W. Clark, Grand Rapids, Wood County School of Agriculture; J. M. Coyner, Mondovi, agricultural department Mondovi Hight School.

Advisory Committee.—C. P. Norgord, Madison, commissioner of agriculture of Wisconsin; K. L. Hatch, University of Wisconsin, assistant director of agricultural extension; R. A. Moore, University of Wisconsin, secretary Wisconsin Pure Seed Association; A. W. Hopkins, Madison, secretary Wisconsin Live Stock Breeders' Association; F. W. Cranefield, Madison, secretary Wisconsin Horticultural Society; J. G. Halpin, University of Wisconsin, secretary Wisconsin Poultry Association; J. G. Milward, University of Wisconsin, secretary Wisconsin Potato Growers' Association; Miss Elizabeth Kelly, University of Wisconsin, superintendent of extension courses for women; Milton C. Potter, Wilwaukee, superintendent of public schools.

Contest Directors.—G. C. Humphrey, University of Wisconsin, in charge of calf club contest; Raymond Baker, Madison, in charge of pig club contest; J. G. Moore, University of Wisconsin, in charge of horticultural contest; J. G. Fuller and J. A. James, University of Wisconsin, in charge of stock judging contests; Miss Elizabeth Amery, University of Wisconsin, in charge of girls' baking clubs; Miss Emma Conley, state department of public instruction, in charge of girls' canning contest; Miss Helen Dodge, Madison High School, in charge of girls' sewing contest; J. A. James, University of Wisconsin, in charge of corn judging contest.

H. N. Goddard, supervisor of awards and premiums.

THE MOTOR SLEIGH AT LAST.

Mr. Frank J. Mathews, a resident of Brill, Barron county, Wisconsin, has recently patented an invention for propelling sleighs. This invention has for its object the provision of a runner attachment adapted for automobiles, so that an automobile may be converted into a sleigh without requiring any special reconstruction of the vehicle aside from the removal of the wheels and the installation of the runners in their places. This invention embodies runner members which are secured to the body of the vehicle, the front runners being connected to the steering spindles, while the rear runners are attached to the rear construction of the vehicle body for the purpose of regulating the contact of the propelling members which replace the rear driving wheels. For several years various efforts have been made to construct an attachment which would easily convert an automobile into a motor sleigh. This device seems to be as simple and efficient as anything which has come to our attention. A set of adjustable rods radiate from the spoke. These rods are fitted with an end piece set on a spring so that when the rod or spoke strikes the earth or snow it is easily adjustable without jarring the occupants of the vehicle. By the attachment which Mr. Mathews has worked out he claims his motor sleigh has all the comforts and convenience of an automobile with the addition that it operates on runners and can be used when there is a heavy snowfall.

CORN AND DAIRY SCHOOL.

The Corn and Dairy School held at Lancaster, Grant county, on January 18th to 21st was a success with an average attendance of 150. The business men were back of the movement and the farmers turned out in good style. Lancaster is a very progressive city, and is the center of one of the wealthiest farming sections of the state of Wisconsin. The farmers were particularly interested in alfalfa and their land is becoming so high priced that it is capable of producing a large amount of feed per acre.

James B. Cheeseman, of Racine, president of the Wisconsin Alfalfa Order, bought the ninth Babcock tester which was manufactured in the United States. This incident came to light in connection with the celebration of the twenty-fifth anniversary of the Babcock test at Madison last week. At that time Mr. Cheeseman was manager of the Deerfoot Farm, Southborough, Mass., and the tester was bought in July, 1890. The factory informed him that it was the ninth one manufactured.

As soon as congress has voted a site in Arlington cemetery a $50,000 memorial to the nuns who served as nurses on the battlefields of the war for the Union will be erected. Mrs. Ellen Ryan Jolly, president of the women's auxiliary of the Ancient Order, of Hibernians, is in charge of the fund. Congressman Ambrose Kennedy is introducing a bill for the setting aside of a site in the national cemetery, and it is expected to be passed.

Banks O. K. heating investment

The improvement of property by putting in radiator heating is looked upon with special favor by bankers and building-loan companies. They recognize the security of the investment, as radiator heating will last a hundred years, and brings big annual savings to the owners. Real estate is immediately put into "preferred class" for rental or sale by installing

The Banker knows that money spent for radiator heating is wisely invested

AMERICAN RADIATORS & IDEAL BOILERS

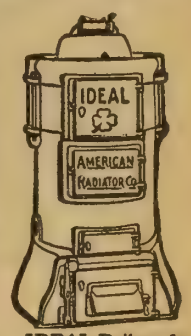
Why do you not have this well-known and highly-prized heating in your own home? Men with great experience in real estate and financial matters look upon it as the most important feature of the building. Your money cannot be spent for a better or larger dividend-paying investment than an IDEAL-AMERICAN outfit.

Don't expect the family to live all winter cooped up in one or two rooms around a stove, and be happy with farm life. That's not healthy or economical. IDEAL-AMERICAN heating will open the whole house and make every room comfortable for all folks by the even distribution of its safe, clean and June-like heat. Get an IDEAL-AMERICAN outfit. The women folks ought to have a portion of the improvement-money that you put back into the farm, and, anyway, the success of the farm depends, more than you think, upon the *health of your wife* and the comfort and convenience of your home—the heart of the farm. Make the seven winter months easy ones—pleasant for work, and more healthful for wife and young folks.

The IDEAL Boiler is placed in basement, side-room or lean-to. No labor, no lugging coal upstairs, no dirt, dust or escaping coal-gas. Phone the local dealer about IDEAL-AMERICAN heating outfit for your old or new building—put in without family disturbance or tearing partitions. IDEAL Boilers will burn any local fuel—soft coal, screenings, lignite, pea coal, wood, oil, or gas, and the fuel saving will surprise you.

A No. 5-19-W IDEAL Boiler and 450 ft. of 38-in. AMERICAN Radiators, costing the owner $800, were used to heat this farm house. At this price the goods can be bought of any reputable, competent Fitter. This did not include cost of labor, pipe, valves, freight, etc., which vary according to climatic and other conditions.

Send today for copy of our (free) book "Ideal Heating"—48-pages full of illustrations which will give you much valuable information on the subject of farm house heating.



IDEAL Boilers do not rust or wear out—no repairs. Always ready for service and supply ample heat with one charge of fuel for 8 to 12 hours in zero weather.

Showrooms in all large cities

Stick to Potatoes.

To the Editor:—When we potato growers are confronted by the ups and downs which we have undergone this season we are rather inclined to look for some crop to grow which is less susceptible to the drawbacks the growing of the tuber inherit.

The agricultural authorities, however, advise us to stick to the game. My experience for the past five years seems to bear this out. Had it not been for the severe freeze last September I would have made a killing with this season's crop. As it is, I will have a very nice profit from the crop. A liberal credit is due to the five applications of Bordeaux spraying, which resulted in my controlling the late blight, which was so disastrous to many fields.

For the past five years I have been breeding the Green Mountain and from a field yield of 110 bushels in 1910 I have managed to increase each successive yield up to the 325-bushel mark and I do not think I have hit the high mark by considerable.

I have managed by careful seed selection to eliminate all mixtures and

A FIELD OF RUSK COUNTY POTATOES.

now have a pure seed of this variety which is true to type and has all the requirements of first-class seed stock.

I am practicing the five-year period of rotation. After potatoes I sow corn, after corn oats or barley, seeding to clover. After oats I take off three crops of hay and seed to clover, two crops the first year after seeding and one crop the second year, plowing under the second crop when in bloom, and the following spring plant to potatoes and so on around the cycle.

I sort my seed, aiming to have a uniform, smooth, four-ounce tuber. This is treated by submerging in a solution of formalin and is then hand cut into three pieces, care being exercised to have two good, strong buds to each seed piece.

I use a horse planter and plant twenty bushels to the acre. I space thirty-three inches between rows and twelve inches between hills. As soon as the vines are up far enough so the row can be followed I go in with a wheel disk cultivator on which the disks are set so as to cover up the vines, and as soon as the vines show through the ridges I go over the field crossways with a light harrow and drag them thoroughly. The advantage I find in this is it controls the weeds that develop in the rows and gives a clearer cultivation. I give the field five cultivations, the last two with one-horse hand cultivators. The last cultivation wallows down the vines considerably. I practice level cultivation, not hilling.

The cost last season was $54.60 per acre, which includes seed, all materials and labor and $20 per acre for use of the ground. I am planting approximately 15,000 hills to the acre and when I can grow three pounds to the hill I will have to build more storage or cut down the acreage. I recently sold an order for 3,000 bushels of certified seed from the West Coast Potato Association, of Stockton, California. C. P. Coon.

Rusk Co., Wisconsin.

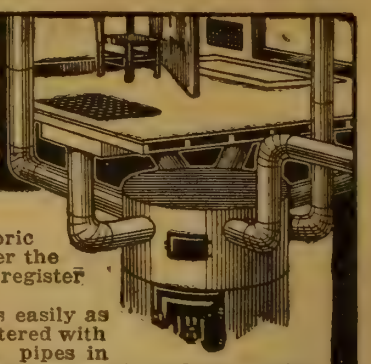
The Farmers' Institute at Plainfield.

To the Editor:—Plainfield is located in the western part of Waushara county in the light, sandy loam soils of Wisconsin. This region is the subject of much sympathy from people living on the heavier soils of Wisconsin and of other states. Many times this region is also the subject of much disparagement by the uninformed. It is too bad that the people of Wisconsin could not have seen Plainfield when it entertained the farmers' institute. A council of business men with the bank as a center looked after the financial end of the work and of the general preparations for the institute. Over $200 was raised. Special printed matter was sent out in 450 letters of special invitations to farmers about the town. The country folks were invited to lunch both days and an extensive premium list was made to promote a community fair of dairy cattle and products. A goodly amount was placed on articles of the culinary art. What was the result? Over thirty head of pure-bred dairy cattle were shown and some of this stock was of very high-producing strains. Over sixty articles were entered for the premiums of the culinary department. One hundred and fifty-six entries of farm crops were made. All in all, this exhibit would do credit to the most favored portions of this earth. The clover seed was so good that the judge from the farmers' institute force said that he would probably secure his clover seed from that shown by the farmers here. The exhibit of corn was good. The grain and potato and vegetable exhibits were excellent. Every session of the institute was crowded by a most wide-awake assemblage of farmers. The women's institute was also crowded. Four thousand cups of coffee, 2,000 buns, 100 pounds of meat and 1,700 doughnuts were consumed at the two midday lunches. A long list of farmers signed up for assistance with various farm projects, not the least of which was barn ventilation. This region has long been cropped extensively to potatoes, but from now on attention will be turned more and more to dairying, better stock, the growing of clover and alfalfa, seed corn and better potatoes. The people of Plainfield have every reason to be proud of the farmers' institute of 1916 and they have little reason to feel any dissatisfaction with the country. All that is necessary is to diversify a cropping system based upon dairy farming and no part of Wisconsin will prove superior in profitable returns and as a place in which to live.

The institutes of Wautoma, Almond and Hancock were also very successful from the standpoint of attendance and the signing of farmers for follow-up work. The Wautoma farmers will soon gather to organize a breeders' association. These places are all out to do various community enterprises which will tend to a more profitable agriculture and development. All the lighter soils of Wisconsin need is a system of farming which will tend to restore organic matter to the soil and a system of dairy farm feeding which will keep up a high state of fertility and these soils will prove to be the most responsive soils in the world. The people of the vicinity of the towns named have the possibilities of the region well in mind and are going forward to realize upon them.

E. L. Luther.

Heating Pipes Are Needless



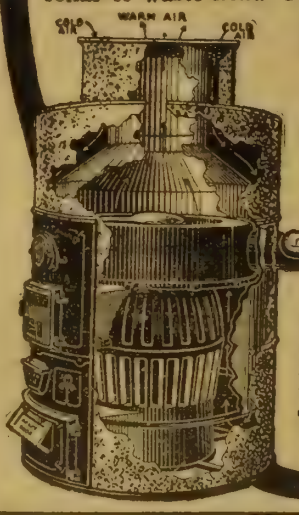
(Copyright 1915 by The Monitor Stove & Range Co.)

When you fit your house with the Caloric pipeless Furnace. It fits immediately under the floor and the warmed air from its single register circulates through the entire house.

You can install this furnace almost as easily as a stove and you do not have your cellar littered with a labyrinth of pipes. There being no pipes in the cellar this is the one furnace that will not spoil produce. The

(Patented) PIPELESS CALORIC FURNACE (Patented)

is designed on new principles and has desirable features that cannot be found elsewhere. It is guaranteed to save 35 per cent of your fuel. This great saving is effected by means of our ribbed firepot, and the fact that there are no pipes running through the house and cellar to waste heat. The ribs admit free air circulation which causes the coal to burn thoroughly. No clinkers to lose you money. These ribs prevent ashes from forming on the firepot and retarding heat radiation. The Caloric firepot has 600 square inches greater radiation than the average firepot.



Install It Easily in Any House--Old or New

Nothing to do but cut one hole for a register. By digging a small pit you can even put the Caloric Pipeless Furnace in a house that has no cellar. It will burn coal, coke or wood. Bring city comforts to farm homes. Saves the labor of carrying fuel upstairs and ashes downstairs. The Caloric Pipeless Furnace lessens fire danger to house and children. It provides a healthful uniform heat for every room in the house.

Our Strong Guarantee

to prove our confidence. If the Caloric Pipeless Furnace is not entirely satisfactory we'll make it so any time within one year. If there is no dealer in your town to demonstrate this furnace write us for illustrated catalog.

256 Gest St., Cincinnati, O.

Trapping Laws.

To the Editor:—I saw an article in your paper recently concerning fur-bearing animals and the different laws of the state. As the laws now are they open the 15th of November and close the 15th of March on muskrats and mink. Now, as I am an old trapper, I am going to give you my ideas on this subject. Not that they may amount to a great deal, but here goes:

If I could have anything to say about the laws I would say to prohibit all fall trapping on muskrats and give us spring trapping from the time it opens up in the spring until the first of May. Then we could get some fur that was good. Muskrats are never prime until spring. I suppose some people would put up a great howl and say that spring is the breeding time, but I would like to ask of these people if they think those from which we take the pelts in the fall do any breeding?

Emory Knowlton.

Jefferson Co., Wisconsin.

Bumper Potato Crop.

To the Editor:—This is to tell you how I raised a bumper crop of potatoes in 1915. I planted them on the 15th to 20th day of May on land that was well matured the year before. Some had winter wheat and some had corn on the year before. It was plowed in the spring, disked and harrowed well, making a good seed bed. The potatoes were planted three feet apart in the row by eighteen inches the other way. Just before they came up they were dragged with a light drag crop, then cultivated until they were large enough to hill. Then I run through them with a shovel plow and followed a little with a hoe. Bugs were kept off with Paris green and arsenate of lead mixed. This is very important and must be done in time. Seed was selected at digging time and stored in cold cellar.

For some time I have raised four kinds: Triumph, Burbank, Russet and Rural New Yorker. The Burbank and Russet are favorites for family trade. We have raised Burbanks for fifteen years and Russets for twelve years, and they are not run out. These kinds, having many eyes, must not be cut too small. That is one reason why some cannot get a good crop of them. These four kinds cannot get mixed.

I sort them very carefully at digging time, leaving the scabby and rough stock home for feeding, which insures me 10 cents to 15 cents more on the bushel. City people have no place for the waste and it might as well be fed up on the farm.

By all means rotate crops and do not plant more than you can take care of.

Chas. Parsons.

Langlade Co., Wisconsin.

$1.00 PER WEEK Enough said. Write the Wisconsin School of Telegraphy, Dept. A, Oshkosh, Wisconsin.

More on Barn Ventilation.

To the Editor:—I built a barn in 1913 32x84 feet with basement, stalls for thirty-one cows and four box stalls. I have a separate room equipped with stanchions. I have the King system of ventilation and have four pipes eight inches by fourteen inches running from about eight inches above the basement floor and running up the walls and along the roof to the cupola. On a cold morning, zero weather, I have seen fully an inch of frost on the inside of the cupola. This, of course, comes from the floor of the basement. The people who put in my system sent a man from the factory to install cupola and pipes and finished up everything in good shape. The intakes for fresh air may be easily put in by carpenters or masons while building. I think the system of ventilation I have is very good and the cupolas are attractive as to finish and design.

Grant Co., Wisconsin.

Look to the Land and Seed.

Important in Alfalfa Growing---Pointers From Address by A. C. Johnson, Traffic Manager C. & N. W. R. R.

FEW, if any, farms are physically adapted in their entirety to the successful production of alfalfa, and yet practically every farm has sufficient acreage, if selected, to produce a required amount. The tendency is, when poor selection is made and failure is a direct result, to retire from further effort; where favorable results are secured by accidental selection to greatly increase the acreage physically unsuited for the purpose—all of which makes prominent the importance of selection of land and seed, with due regard to all other essentials, as one acre will suffice for a test, while 100 acres might be a problem.

Successful production of alfalfa requires one fast rule: More official work to increase the average standard of production and quality, keeping step with progress and business demands, preventing possible discouragement caused by misdirected effort and removing the production of alfalfa from the experimental stage in the shortest possible time. Such procedure requires engineering ability in the selection of land, knowledge of soils and especially of seeds and other requirements usually possessed by the average farmer. When the essentials are known and understood, we think, one of the most important matters is the question of climate and its relation to effect on seed.

Mild climate seeds will germinate in a more severe climate, but do not stand the necessary after tests. Climatization of seeds is a pronounced necessity. The permanency of an alfalfa crop is a large element of its value. The severe test of permanency, other conditions being favorable, lies in the winter-resisting power of the plant, made possible by acclimation of seed. Theorists inform us there is no complete remedy against winter-killing on account of there being no seed yet sufficiently climatized to wholly resist it. We agree with such theory, but the seed that has been longest produced under certain conditions will produce the highest per cent of good results under similar conditions. If seed can be secured in a locality where it is to be seeded and it has been successfully produced in such locality for a period of time it is, the most desirable seed to use.

South Dakota ten years ago produced only a few acres of alfalfa, and yet in certain sections of the state it has been successfully produced continuously in the same fields for twenty-five years, insuring profit and longevity of crop. During the season of 1915 there was 199,918 acres engaged in alfalfa production. This same acreage should have produced twice as many tons as were produced. However, this is a wide range in individual production and a state average. For instance, the state of Illinois is the largest corn-producing state, and, while there are individual productions in Illinois of over 100 bushels per acre, the average for the entire state was thirty-six bushels per acre. In South Dakota we know of non-irrigated land, one field in particular, with alfalfa twelve years of age that produced a little over eight tons per acre in the four cuttings in 1915, which was an unusually favorable season for alfalfa feed, but not for seed.—South Dakota produced 31,000 bushels of alfalfa seed in 1915 and it is the largest alfalfa seed shipping state in the Union. We know the acreage has more than trebled in five years and will be doubled in 1916. This condition, so far as possibilities are concerned, is representative of South Dakota, North Dakota, Minnesota, Wyoming, Iowa, Illinois, Michigan, Nebraska and Wisconsin.

In the sale of seed there is wide opportunity for fraud. This, added to much ignorance on the part of some dealers in seed, leads almost direct to failure for the planter. A purchaser in northern Wisconsin knows he does not want a seed produced in Kansas or Louisiana, and yet he does not have the means of knowing, except on statement of dealer, who, in turn, possibly does not know. The Turkestan alfalfa comes from a wide range of country and various climatic conditions and represents as wide a variation as Kansas and Minnesota seeds; so that variety alone does not determine what is equally or more important, the climatic and hardy variety of any kind of seed. The protection is to secure seed from a similar locality, or, better, produce your own seed. Alfalfa successfully produced lays the foundation for all other successful farm efforts. A location or district thus established directly concerns and insures due consideration by a transportation company.

Land that is idle for any reason is practically worthless. If profitably employed it is brought into the production class. If it can be made more productive by a crop that in turn supplies direct, and through agencies, fertility that again adds to volume, it will in an accumulative effect produce an excess and such excess in volume produces transportation. A common carrier is dependent entirely on volume of traffic, and volume is one of the most important and prominent factors in rate construction. Thus the prosperity of the farmer adds to the prosperity of the transportation company.

FINE BREEDERS' MEETING.

The Waupaca and Portage Holstein Breeders' Association held an interesting meeting recently at Manawa, Wisconsin, in the Gem Theater building, January 29th. The theater was donated for the meeting by Mr. Kanoke. Pres. John Erickson, of Waupaca, called the meeting to order and Secretary Pinkerton, also of Waupaca, read the report of the last gathering. The following officers were elected for the ensuing year: President, A. L. Lowe, Waupaca; vice president, W. Kissinger, Weyauwega, reelected; secretary and treasurer, Arthur W. Ritchie, Royalton; member at large, Felix Paronto, Manawa. Plans for future advertising were discussed and other important business transacted. The report of the secretary showed a large increase in membership during the past year. Sim Shambeau, of Ogdensburg, was elected toastmaster for the banquet, which was held in the Ceylon Hotel. It was a fine feast. During the dinner hour music was furnished by an orchestra, which was hired for the occasion by the business men of Manawa. This was highly appreciated by the members of the association.

The afternoon session was called at 2 p. m. and a few other matters of business discussed, after which a fine address was delivered by Mr. Riordan, of the "Mayville Farms."

Plans for the next annual meeting were made; also arrangements for the annual picnic to be held at A. L. Rowe's farm near Waupaca, some time during the summer.

Much interest and enthusiasm was made manifest and a feeling of good will toward fellow breeders was prevalent during the entire meeting.

—POWER

that laughs at the heaviest roads

Never in the history of the industry has there been a 4-cylinder car that offered so much POWER at its price as this new SERIES 17 Studebaker. Never has there been offered to the man living in the country, to the man running a farm, to the man driving over the muddy roads and the trying hills a car with such masterful yet ECONOMICAL power as this SERIES 17 Studebaker possesses.

POWER with economy of gasoline has always been a Studebaker ideal. And this car's big, 3⅞-inch bore x 5-inch stroke motor develops and delivers FULL Forty Horse Power with a surprisingly low consumption of fuel.

It is the ideal car for the man operating a farm—big, light and sturdy and easily operated. It has room for SEVEN to ride in COMFORT. It is handsome in design and finish. It incorporates many new refinements of design such as the tank in rear with Stewart Vacuum Feed; DIVIDED and adjustable front seats; overlapping, storm-proof windshield; self-starting and lighting control and other instruments conveniently located on dash, illuminated by new indirect lighting system. And taken from any angle, it offers the BIGGEST value, dollar for dollar of the price, that the industry has ever seen.

See this new SERIES 17 Studebaker at once—and write for handsome catalog.

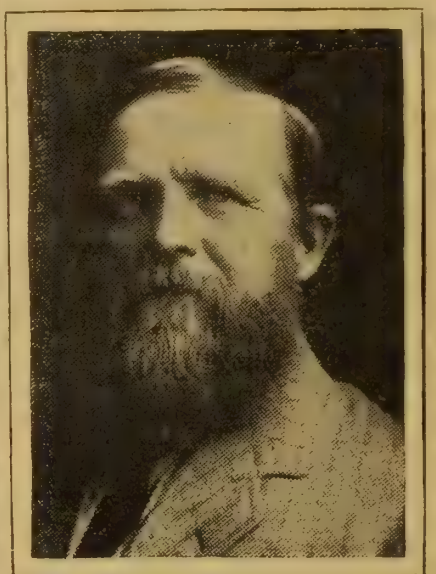
FARMERS REVIEW PROGRESS.

Farm and Home Week at College of Agriculture Brings Together Various Agricultural Forces to Discuss Best Methods of Farming.

GENERAL VIEW OF EXHIBIT HELD IN LIVE STOCK PAVILION UNIVERSITY FARM, MADISON, FARM AND HOME WEEK.

MORE than 1,000 Wisconsin farmers and stockmen attended the Farm and Home Week meetings held last week at the college of agriculture in Madison. Breeders' meetings representing the Wisconsin Live Stock Breeders' Association, the dairy and beef breeds of cattle, the hog breeds and the horsemen's association, brought a large number of representative men of the state to the capital. There was also a good showing of dairy breeders from outside the state at the annual meeting of the Western Guernsey Breeders' Association which was held in Madison, Thursday, February 10th. Members of the Wisconsin Agricultural Experiment Association and the Wisconsin Alfalfa Order helped swell the crowds and the Country Life Association and other meetings brought a goodly number all interested in the betterment of the farm and home.

Dairying was given the place of prominence in the week's program, and rightly so because of the splendid record which Wisconsin is making in this industry. Twenty-five years ago, as previously related in The Wisconsin Farmer, Dr. Stephen Moulton Babcock, a member of the faculty of the Wisconsin College of Agriculture, discovered and gave to the world the Babcock test. Briefly, this test has put the dairy business on a "certainty" instead of a "guesswork" basis. The remarkable feature about this wonderful discovery is that in a quarter of a century no scientist, not even the learned doctor himself who was the inventor, has been able to make any alteration of note to improve it. Nothing could more clearly demonstrate the painstaking care with which this great invention was originally worked out. Dr. Babcock was accorded a complimentary banquet. Three hundred representative farmers and students of agriculture, scientists and state leaders in other lines, gathered to honor him. President Van Hise, of the university, presided. Governor Phillip, Dean Russell and others spoke. Letters and telegrams were received from twenty-six states felicitating Dr. Babcock on his life work. There were also testimonial expressions from foreign countries. A parchment forwarded to Dean Russell, of the college of agriculture, by the staff of the dairy division, United States Department of Agriculture, read as follows:



S. J. UHRENHOLDT, SAWYER COUNTY.
Chosen for special recognition by the Wisconsin College of Agriculture.

MRS. ADDA F. HOWIE, ELM GROVE.
Chosen for special recognition by the Wisconsin College of Agriculture.

To Dr. Stephen Moulton Babcock:—We, who have been assembled by our government to promote the industry to whose advancement you have contributed so much, take this inadequate means of conveying to you our congratulations and good wishes on this anniversary. Anything that we could say pertinent to this occasion has been said many times. Your work has made an enduring monument for itself in the invention which bears your name. We know, however, that incalculable as is its value, this invention is not your greatest contribution to agriculture or to science. The far-reaching effect of your work will come from the example you have set, the inspiration your life has been, to hundreds of students and investigators in this country. Your life has been devoted to the quest of the absolute. You have avoided the publicity of the administration office and the lecture platform. Propaganda and exploitation have had no place in your career. Through all these years, which have spanned the period of evolution of agricultural science, you have not swerved from your search for truth for truth's sake. You have set an example of devotion to an ideal. You have shown that, though working quietly and unostentatiously, a man may achieve success and renown. Your life cannot fail to have a profound influence on those who come in contact with you and this influence is going out through your students, your associates and your readers in ever widening circles. Many of us carry in grateful memory your kindly interest in our struggling efforts. To all of us it is a source of gratification and encouragement to know that you are now able, in a congenial atmosphere and surrounded by friends and well-wishers, to devote yourself to your favorite problems. We cannot offer a better wish on this occasion than the hope that you have a full realization of the honor and esteem in which you are held by us all. The Staff of the Dairy Division, Washington, D. C., February 9, 1916.

This official government document fairly expressed the sentiment of those who met to honor Dr. Babcock. Dr. Babcock responded with an interesting story of his life experiences.

Farm power is of such importance that it was given a very conspicuous place on the Farm and Home Week program. The light tractor demonstration was watched with keen interest. Some weeks ago it was announced that a limited number of entries would be received for the gasoline engine school conducted under the auspices of F. M. White, and with the assistance of his agricultural engineering staff. Entries were limited owing to the lack of space in the engineering division. Several times as many farmers would have entered this

Meetings of the Beef Men.

Topics of Interest Discussed and Officers Elected For the Ensuing Year---Attendance Is Good.

THE Wisconsin Short-horn Breeders' Association met at the auditorium Agricultural Hall, Madison, last week. The meeting occurred on the same evening that the complimentary banquet was tendered Dr. Stephen M. Babcock, and this detracted somewhat from the attendance. However, there was a good representative company. The association re-elected the old officers who are as follows: President, E. E. Jones, of Rockland; vice president, George Carpenter, of Baraboo; secretary and treasurer, John L. Tormey, of Madison; directors, Ralph Reynolds, of Lodi, and O. H. Martin, of Bagley.

Mr. Frank Harding, secretary of the American Short-horn Breeders' Association, a resident of Waukesha, was to have been present and addressed the meeting, but he was busy at home superintending the shipment of some of his cattle to Argentina, South America. He wrote advising the members of the state society that it has been decided to issue a new magazine to be known as "The Short-horn in America." Frank D. Thompson has been selected editor. The American Short-horn Breeders' Association will give $50,000 in 1916 as a special appropriation for state fair and national beef cattle expositions and Wisconsin

EBEN E. JONES.
President Wisconsin Short-horn Breeders.

will receive a part of this money. The premiums arranged to be offered at the Wisconsin State Fair in 1916 will total $2,250, which is as much as is offered in any state. Iowa and Minnesota offer no more except that Iowa has a special futurity class which carries a purse of $1,000.

Arrangements were made at the Wisconsin meeting for the appropriation of $125 to the Wisconsin State Fair premium fund for Short-horn classes, $150 for the Interstate Fair, at La Crosse, and $150 for the Sauk County Fair, at Baraboo. These sums will be added to by the fair management in each case mentioned until the total will be raised to $500 for each exhibition.

There was some discussion of judges for the next Wisconsin State Fair and the association suggested three names to the state fair management and hopes that one of these men will be selected to judge the Short-horns next fall. C. F. Curtiss, of Iowa, was first choice; W. C. Rosenberg, of Ohio, second, and J. A. Kilgour, of Illinois, third.

The Wisconsin Live Stock Breeders' Association is endeavoring to interest young people in baby beef contests in several counties. The winners of prizes in county contests will have a competitive exhibit probably at Madison next year and the Wisconsin Short-horn breeders offer a silver trophy to the winner, provided, of course, that the champion calf is a Short-horn.

There is considerable talk of a sale at Madison next year to be conducted on the order of that announced for Des Moines, Iowa, this month. The plan is to hold a show and follow this with a sale. It is likely such a show and sale will be held at dates close to those selected by Anoka Farms and Herr Brothers & Reynolds for their annual sales. A committee including A. R. Maurer, of Fox Lake; William F. McCormick, of Lancaster, and E. R. Williams, of Bangor, will investigate the proposed sale plan and report. The association named Wallace Reynolds and E. R. Williams a committee of two to confer with State Veterinarian Eliason on the matter of state certification of tuberculin-tested herds.

Hereford breeders to the number of about thirty attended the first annual meeting of the Wisconsin Hereford Breeders' Association, which was held at Madison last week. This is a new organization, formed last summer, and the interest already being taken by the lovers of the white faces indicates a strong association within a short time. There are several very fine Hereford herds in the state and the members of this association report an increasing interest in the breed.

It is planned to ask fairs in the beef-producing communities to offer substantial specials for Hereford exhibits as well as the regular prizes in order to get out large and representative exhibits. Secretary Thompson read communications from several fair officials offering to co-operate, the association to contribute a portion of the special money. No definite action was taken on this matter, it being left to a committee. It was generally agreed that the 1916 fairs should have larger Hereford exhibits and everything possible will be done as a state association to increase interest of the breeders in showing.

The old officers were honored with re-election. Irving Jewell, of Mineral Point, is president; H. A. Eberhardt, of Manitowoc, vice president, and C. W. Thompson, of Lake Geneva, secretary and treasurer. The executive committee consists of A. C. Bartlett, Lake Geneva; M. Moore, Sturgeon Bay; Henry Schacht, New Richmond; Hugh Robinson, Evansville; L. M. Scott, Bagley; G. A. Foster, Fairchild, and R. D. Hubbell, Walworth. A committee consisting of Mr. Eberhardt, Mr. Thompson and Mr. Robinson was named to further the fair proposition.

The Wisconsin Aberdeen Angus Breeders' Association held a very interesting annual meeting at Madison last week at which Parker R. Gelbach, of Lancaster, and W. A. Connell of Menomonee Falls, were re-elected president and secretary-treasurer respectively. H. J. Pettigrew, of Oconto, was chosen vice president, and these officers will also constitute the executive committee. A new constitution and by-laws was adopted and the members present predicted an increased interest in the Angus breed in Wisconsin during the coming year. The Angus breeders regard their breed as one of the best suited to Wisconsin beef-producing conditions. Cattle of this breed mature young and make excellent baby beef, their weight being from 900 to 1,300 pounds at this period. They eat grain while on milk, so are usually ready for the market at from one year to eighteen months. Much interest was manifest in the meeting and several new members were received. The plan of the department of agriculture for a certified list of Wisconsin herds known to be free of tuberculosis, which was outlined at this meeting as well as at all other meetings of the breeders at Madison last week, was discussed pro and con, some members approving and some disapproving of the plan. The breeders were enthusiastic over live stock prospects.

The matter of holding a big sale of Red Polled cattle was discussed very fully at the annual meeting of the Wisconsin Red Polled Cattle Club at Madison last week. The state club now has about forty active members who represent some of the best herds in this section of the country and many felt that the time had arrived for the Red Polled breeders to conduct a sale. Others reported that there was always a demand for their breeding stock at good prices and that it seemed useless to hold a sale. No definite action was taken, however, the matter being left to the discretion of the officers.

The tuberculin certified list plan of the Wisconsin Department of Agriculture was endorsed by the club and H. A. Martin, of Gotham, was chosen a delegate to represent the club at the meeting at which rules were to be adopted for testing herds, which are to be certified as free from tuberculosis. J. B. Aheers, of West Bend, was again chosen president; L. C. Underwood, of Avoca, was re-elected secretary-treasurer, and B. R. Curran, of Taylor, was chosen vice president. The breeders reported an increased interest in this beef type in Wisconsin and a good demand for breeding stock.

Wisconsin's Annual Grain Show.

Pure-Bred Grains From Many Counties Compete at Annual Show of Wisconsin Agricultural Experiment Association, Held in Madison Last Week.

GRAIN EXHIBIT SHOWING THE CORN AND GRAINS ON THE TABLES AND THE 1915 WINNING GRAINS, SHOWN AT THE PANAMA-PACIFIC EXPOSITION, AGAINST THE WALL.

THE best and the largest corn and small grain show ever held in Wisconsin," was the verdict of the visitors at Madison last week when the Wisconsin Experiment Association held its annual exposition in the college of agriculture live stock pavilion. There were more than 500 samples of corn, seed and sheaf grains exhibited by about 150 exhibitors, coming from many counties of the state. The seed grains were especially fine, and with the strongest of competition the winners at this show have reason to feel proud of their success.

Considering the poor 1915 season for corn crop, the showing of ear corn was remarkably fine, and visitors were heard frequently to say that they did not think such quality corn was produced in 1915 in Wisconsin or any other state last year. The judges pronounced the corn exceptionally good, taken as a whole, and the winning exhibits would have done justice to a show which followed a most favorable season for corn growing. Everyone expected good showings of alfalfa and the seed grains, as Wisconsin outdid herself last year in the production of small grains and grasses so it was the exceptional showing of corn that aroused the most interest. The corn exhibit proved one thing—that Wisconsin can be depended upon in a bad year. The ears were well filled and the depth of the kernels at the tips was especially good. This was particularly true of the white dent corn which won the sweepstake trophy offered by The Wisconsin Farmer.

The exhibit was held in the live stock pavilion in connection with the Wisconsin products show which featured Farm and Home week. In addition to being the greatest corn and grain show ever held by the experiment association the winning exhibits of last year were displayed, giving the growers a chance for comparison of the 1915 and the 1914 crops. Last year's exhibits were shown in connection with the Wisconsin exhibit at the Panama-Pacific Exposition at San Francisco, which exhibit was returned here from the West especially for this occasion. With the 1915 winning corn, grains and grasses as a background to the 1916 showings it made a farm products display of considerable movement.

Prize-winning bundle of alfalfa, exhibited by John F. Hesprich, of Lomira. This bundle was four and one-half feet high and the crop would yield from six to seven tons an acre.

The experiment association, to encourage new exhibitors and those who have not been first prize winners at previous shows, separate and first prize winners, placing them in an honorary class. In other words, the winners of firsts in previous shows competed among themselves in the honorary class. This tended to encourage the less experienced growers. It made the competition among the honorary exhibitors all the more keen, and at the same time made it possible for the less experienced growers to win some of the money. The first prize winners this year will go into the honorary classes next year.

La Crosse county exhibitors swept the boards in many of the classes and won more ribbons than any other county. This was especially encouraging to growers in the western half of the state who have been beaten so frequently by those from the eastern half, and when the La Crosse county exhibitors took four of the six sweepstakes they were greatly pleased. The fact that a La Crosse county man took sweepstakes on pedigree barley over H. E. Krueger, of Beaver Dam, who for many years has been hailed the "world's champion barley grower," caused much joy in their ranks—not so much for defeating Mr. Krueger, but because they realized that in defeating him they had produced a barley which was especially high in quality.

The Wisconsin Farmer's beautiful silver trophy, offered for the best fifty ears of White Dent corn, went to a La Crosse county grower, S. P. Markle, on Silver King. Mr. Markle also took one other sweepstake prize in addition to many firsts. The sweepstake winners, in full, follow:

SWEEPSTAKES CLASS.

Best 10 Ears Silver King Corn of Entire Show—1st S. P. Markle, La Crosse.

Best 10 Ears Yellow Dent Corn of Entire Show—1st Noyes Raessler, Beloit.

Best Peck Wisconsin Pedigree Barley—1st Wm. Moos, Onalaska.

Best Peck Wisconsin Pedigree No. 1 Oats—1st H. W. Whitehead, Rockland.

(Concluded on page 13.)

ROCK COUNTY BOYS LOOKING OVER THE CORN AND GRAIN EXHIBITED AT MADISON

WISCONSIN'S ANNUAL GRAIN SHOW.

(Continued from page 12.)

Best Peck Wisconsin Pedigree No. 5 Oats—1st H. T. Draheim, Gotham.

Best 50 Ears Silver King Corn—1st S. P. Markle, La Crosse.

The showing of alfalfa in bundles was pronounced by Mr. L. F. Graber, secretary of the state order, as the best ever held. The winning bundle shown by John F. Hesprich, of Lomira, measured 4½ feet long and was estimated to run about six to seven tons to the acre. P. A. Paulson, of Hudson, who won the first world's championship on alfalfa for Wisconsin at the 1913 national corn show, took second, and Lewis M. Hanson third.

The exhibits of seed grains were especially fine, and the barley shown, except for color, was the best in years. All grains were very plump and the weight per bushel very high, the sweepstake barley grown by William Moos, of Onalaska, weighing 52½ pounds. The off color in barley was due to the wet weather during harvest time. Some wonderful samples of wheat, oats, rye, etc., were shown and the list of awards, as announced by the association, follow:

10 Ears Silver King (Wisconsin No. 7) Corn—1st Hieron Block, Burlington; 2d J. A. Brunker, Ridgeway; 3d W. J. Steinhoff, Platteville; 4th Otto Wolf, La Crosse; 5th Jos. T. Hans, Jefferson.

10 Ears Early Yellow Dent (Wisconsin No. 8) Corn—1st Alf. Austin, Janesville; 2d H. E. Krueger, Beaver Dam; 3d Chas. Hull, Tigerton.

10 Ears Golden Glow (Wisconsin No. 12) Corn—1st Hieron Block, Burlington; 2d S. S. Foster, New Richmond; 3d Jippa Wielinga, Midway; 4th J. E. Brunker, Ridgeway; 5th Arthur Popp, Jefferson.

10 Ears Clark's Yellow Dent (Wisconsin No. 1) Corn—1st Frank Cairns, Mazomanie; 2d J. W. Jung, Randolph; 3d Jos. T. Nans, Jefferson; 4th H. E. Krueger, Beaver Dam.

10 Ears North Star Yellow Dent (Wisconsin No. 11) Corn—1st Noyes Raessler, Beloint; 2d H. E. Krueger, Beaver Dam.

10 Ears Murdock (Wisconsin No. 12) Corn—1st H. C. Brueckner, Jefferson; 2d Justus Brueckner, Jefferson; 3d Chas. Austin, Milton; 4th Fred Stubley, Black Earth; 5th Arthur Popp, Jefferson.

10 Ears 8 Rowed Red, Yellow or Smut Nose Flint—1st H. T. Draheim, Gotham; 2d Lauren Hastin, Eagle; 3d Arthur Popp, Jefferson; 4th H. E. Krueger, Beaver Dam; 5th J. W. Jung, Randolph.

10 Ears 8 Rowed White Flint—1st Chas. T. Leonard, Jefferson; 2d Anton Bohl, Beaver Dam; 3d H. E. Krueger, Beaver Dam; 4th Arthur Popp, Jefferson; 5th H. T. Draheim. Gotham.

10 Ears Pop Corn—1st J. F. Staples, Onalaska; 2d C. H. Howitt, Randolph; 3d Jos. T. Hans, Jefferson; 4th H. T. Draheim, Gotham; 5th Arthur Popp, Jefferson.

Single Ear Dent Corn—1st H. T. Draheim, Gotham; 2d Jippa Wislina, Midway; 3d Otto Wolf, La Crosse; 4th T. S. Ward, Ft. Atkinson; 5th J. A. Brunker.

50 Ears Silver King Corn (Wisconsin No. 7)—1st S. P. Markle, La Crosse; 2d Anton Bohl, Beaver Dam; 3d Otto Wolf, La Crosse; 4th Heiron Brock, Burlington; 5th Noyes Raessler, Beloit.

50 Ears any Wisconsin Standard Yellow Dent Corn—1st Jippa Wielinga, Midway; 2d H. C. Brueckner, Jefferson; 3d John Van Loon, La Crosse; 4th Hieron Block, Burlington; 5th Noyes Raessler, Beloit.

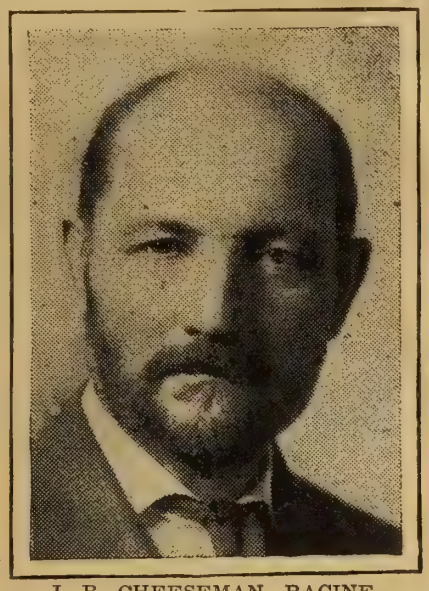
Peck Wisconsin Pedigree or Oderbrucker Barley—1st Wm. Moos, Onalaska; 2d Otto Wolf, La Crosse; 3d Jos. T. Hans, Jefferson; 4th John Schwartz, Antigo; 5th Alfred Klein, Lomira.

Peck Two-row Barley—1st Anton Bohl, Beaver Dam; 2d H. E. Krueger, Beaver Dam; 3d H. T. Draheim, Gotham.

Peck Wisconsin Pedigree No. 1 Oats—1st H. W. Whitehead, Rockland; 2d Lewis M. Hanson, Eleva; 3d P. J. Marmes, Antigo; 4th Adolph H. Thompson; 5th Roy E. Leemon, Waupun.

Peck Pedigree No. 5 Oats, or Swedish Select Oats (Wisconsin No. 4)—1st Wm. Moos, Onalaska; 2d H. W. Whitehead, Rockland; 3d H. E. Krueger, Beaver Dam; 4th Erick Mickelson, Pembine; 5th J. L. Krause, Beaver Dam.

Peck Sixty Day or Kherson Oats—1st H. E. Krueger, Beaver Dam; 2d H. T. Draheim, Gotham; 3d Alfred Klein, Lomira; 4th G. R. Welch & Son, Antigo; 5th Clarence Rhodes, Kansasville.



J. B. CHEESEMAN, RACINE.
President Wisconsin Alfalfa Order.

Peck Any Other Variety of Oats—1st H. E. Krueger, Beaver Dam; 2d De Witt Damp, Dane; 3d L. Leslie, Antigo; 4th Wm. Neuberger, Reeseville; 5th Ed Peters, La Crosse.

Peck Winter Wheat—1st Noyes Raessler, Beloit; 2d J. J. Ihrig, Oshkosh; 3d G. W. Kuhlman, Lowell; 4th A. A. Goetsch, Juneau; 5th Carl J. Piek, Chilton.

Peck Spring Wheat—1st Josh Schelb, Stratford; 2d Art Blumenstein, Woodruff; 3d Arthur Popp, Jefferson; 4th Martin Haevers, Luxembourg; 5th Herb Chelstrom, Turtle Lake.

Peck Wisconsin Pedigree Winter Rye—1st Ed Whitemore; 2d John Schwartz, Antigo; 3d Morgan Grandy, Wausaukee; 4th J. G. Kading, Reeseville; 5th H. R. Zimmermann, Wausau.

Peck Medium Red Clover Seed—1st J. L. Krause, Beaver Dam; 2d Hieron Block, Burlington; 3d A. F. Jacobs, Coloma; 4th Robert J. Plenty Rice Lake; 5th Stanley Sebion, Westby.

Peck Mammoth Red Clover Seed—1st Graham, Fennimore; 2d J. W. Jung, Randolph; 3d J. L. Krause, Beaver Dam; 4th H. E. Krueger, Beaver Dam; 5th Peter Kneeland, Windsor.

Peck Alsike Clover Seed—1st Schmidt Bros., Foxboro; 2d H. E. Krueger, Beaver Dam; 3d J. L. Krause, Beaver Dam; 4th Lauren Hastin, Eagle.

Peck Timothy Seed—1st A. N. Kelly, Mineral Point; 2d Lewis M. Hanson, Eleva; 3d H. E. Krueger, Beaver Dam; 4th Emil Breger, Madison; 5th J. W. Jung, Randolph.

Peck Alfalfa—1st H. E. Krueger, Beaver Dam.

Peck Silver Hull Buckwheat—1st H. E. Krueger, Beaver Dam; 2d Arthur Popp, Jefferson; 3d Cook Bros., Burlington; 4th Anton Bohl, Beaver Dam.

Peck Japanese Buckwheat—1st J. L. Krause, Beaver Dam; 2d H. T. Draheim, Gotham; 3d Anton Bohl, Beaver Dam; 4th H. E. Krueger, Beaver Dam.

Peck Black Soy Beans—1st A. F. Jacobs, Coloma; 2d J. A. Hass, Ellison Bay; 3d Max Schlies, Peshtigo; 4th Elmer Kopp, Eau Claire.

Peck Green Soy Beans—1st H. E. Krueger, Beaver Dam.

Peck Yellow Soy Beans—1st H. E. Krueger, Beaver Dam; 2d Arthur Popp, Jefferson.

Peck Yellow Field Peas—1st H. E. Krueger, Beaver Dam; 2d Arthur Popp, Jefferson.

Peck Green Field Peas—1st Martin Haever, Luxembourg; 2d H. E. Krueger, Beaver Dam; 3d Arthur Popp, Jefferson.

Peck Smooth Peas—1st H. E. Krueger, Beaver Dam.

Peck Wrinkled Peas—1st H. E. Krueger, Beaver Dam; 2d Arthur Popp, Jefferson; 3d J. W. Jung, Randolph.

Peck Navy Beans—1st H. E. Krueger, Beaver Dam.

Goodrich "HIPRESS"

—The Rubber Boots and Shoes

"With the Red-Line 'round the top"

We've been giving you actual instances of the remarkable superiority of the MOLDED RED-LINE Rubber Footwear. Here's another that came to us recently. Willard Crane, of Martel, Warren county, Ohio, started in February with a pair of "HIPRESS" and wore them steadily 301½ days before they would give in. The roughest usage imaginable—concreting, railroad work, tile ditching, etc. Said he had been buying three pairs of boots a year for ten years until he tried "HIPRESS." He is so enthusiastic that he went before a notary and made the above statement under oath, sending us a copy. *That's* the service "HIPRESS" is giving—it is so far ahead of the ordinary boot and shoe that there is no comparison.

"HIPRESS" is made of the same tough rubber that goes into Goodrich Auto Tires—MOLDED INTO ONE SOLID PIECE! Weakness of the hand-made boot thus not possible—they'll outwear anything on the market. Remember—Goodrich is the only concern making these wonderful boots and shoes—you can tell the genuine by the RED-LINE 'ROUND THE TOP.

Come in all styles—short boots, hip boots, pacs, arctics, etc.

The B. F. Goodrich Company

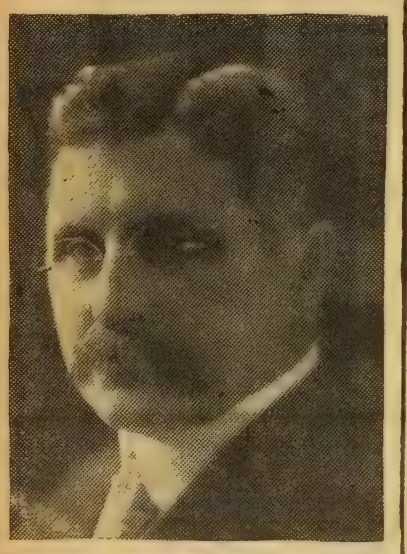
FARMERS REVIEW PROGRESS.

(Continued from page 10.)

division if they had gotten a chance. The present price of gasoline seems to have caused no dimunition in interest in gas engines. There was also an exhibit of farm electrical equipment and it aroused great interest, especially from the home lighting standpoint. Several companies donated the use of light tractors for the gas engine show and these made regular trips through the snow demonstrating their efficiency. The light tractor bids fair to become very popular on Wisconsin farms. Wisconsin farmers have made a careful study of cultivation methods, and, as most of them own their own farms, they are willing to make sufficient investment in power machinery to make their work bring bigger profits.

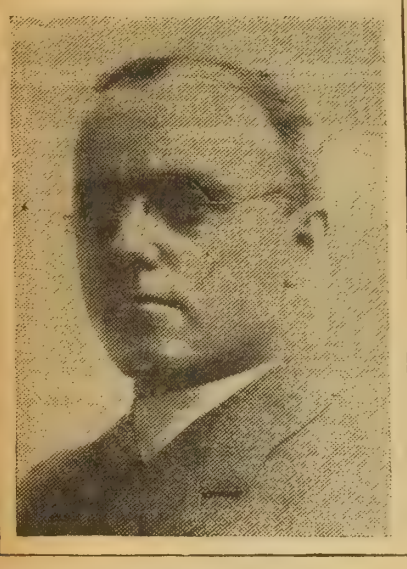
The spirit of the Babcock twenty-fifth anniversary was carried out in other departments. By special arrangement most of the Wisconsin ex-



W. D. FROST, MADISON.
Conducted Round Tables at the Wisconsin Country Life Conference.

hibit at the recent Panama-Pacific Exposition in San Francisco was reproduced in the university stock pavilion for the benefit of Farm and Home Week visitors. Here was seen the farm kitchen and sitting room of twenty-five years ago and the same rooms furnished in a modern way as they may be furnished today. There was a model farmstead which attracted a great deal of attention and choice exhibits of Wisconsin products of the field and dairy.

As usual, the college of agriculture named this year candidates for recognition because of conspicuous service in agricultural work in Wisconsin. Mr. S. J. Uhrenholdt, one of those named, a farmer of Sawyer county, has been conspicuous because of his success in the Upper Wisconsin country. He came to Wisconsin when sixteen years of age and settled in the



H. G. BELL, CHICAGO.
Representative of the National Fertilizer Association.

white pine country. He has made a study of forestry and carefully preserved his timber so that it has paid him better than 10 per cent on his investment. Mr. Uhrenholdt never received any instruction on forestry, but has worked out his ideas in the big school of "experience." Mrs. Adda F. Howie, of Elm Grove, Waukesha county, also received special recognition. Mrs. Howie was in charge of the Wisconsin grain and dairy show at the Panama-Pacific Exposition and she remained in charge during Farm and Home Week while the show was put on in the stock pavilion on University Farm. As a special evidence of Mrs Howie's high standing in the farm world and her ability as director of agricultural exhibits a beautiful amethyst brooch was presented to her with a letter of commendation for her work at the Panama-Pacific Exposition. Mrs. Howie is one of the leading cattle raisers in the state, having the largest herd of Jersey cattle in Wisconsin. Aside from her active connection with her farm at Elm Grove, Mrs. Howie has been on the farmers' institute force for eight years and was the only woman to have received an appointment as a member of the state board of agriculture.

The program of addresses was up to the high standard set in previous years. The meetings were crammed into one week this year instead of two as formerly. One of the important features was the conference of representatives of cow-testing associations. Wisconsin now has forty-five of these associations and more being added every month. The Wisconsin Farmer has urged the importance of such associations and we are very glad to see the work progress. Noel E. Negley, of Madison, told the visiting farmers how twenty-one years ago in Denmark, the home of co-operative enterprises, the first cow-testing association was organized. In 1905 the first association was started in the United States. There are now 250 associations in this country and almost one-fifth of them are in Wisconsin. The large number of cows in Wisconsin has given greater impetus here toward such organizations. Mr. Negley told of the excellent work which is being done by the Wisconsin Dairymen's Association, organized in 1872 by Ex-Governor W. D. Hoard. This association, with an appropriation of only $4,500 annually, is able to keep forty-seven men in the field to interest 1,500 men in testing and to save for them at least $50,000 annually. Mr. Negley urges more cow-testing associations in 1916.

The annual session of the Country Life Conference under the direction of C. J. Galpin brought out many points of interest. Club work is on the increase in Wisconsin. Reports from various clubs showed that the following specific things had been accomplished in Wisconsin by clubs in the past few years:

Introduced experiments in lime, rock phosphate and alfalfa.
Promoted cow-testing organization.
Started movement to erect town hall.
Bought pianos and victrolas for school and community use.

THE NORTHWESTERN MUTUAL LIFE INSURANCE CO. MILWAUKEE, WIS.

GEO. C. MARKHAM, President

To the Public

The 58th Annual Report of the President to the trustees and other policyholders of the Company shows the following transactions for the year 1915

Death Claims Paid		$13,845,763.96
Endowments Paid		4,500,097.36
Dividends of Surplus Paid		13,271,991.90
Surrender Values Paid		10,598,673.85
Annuities		242,488.58
TOTAL PAYMENTS TO POLICYHOLDERS	$42,459,015.65	
Addition to Assets	15,383,683.17	
Grand Total for Benefit of Policyholders	$57,842,698.82	
New Insurance Paid For		127,401,120.00

Total Insurance in Force, $1,420,012,571

FINANCIAL CONDITION JANUARY 1, 1916

ASSETS		LIABILITIES	
Loans on Mortgages	$181,861,021.75	Legal Reserves	$312,136,886.00
Bonds (Market Value)	84,656,310.00	Installments	4,875,455.19
Loans on Policies	55,085,173.44	Claims, Taxes, Dividends Due, etc.	4,976,344.28
Real Estate	4,972,068.06	Annual Dividends of Surplus, payable 1916	11,946,750.00
Cash	4,380,382.87	For Deferred Dividends,	1,452,301.00
Miscellaneous	12,676,153.93	Contingency Reserve,	8,243,373.58
Total	$343,631,110.05	Total	$343,631,110.05

Despite the generally depressed and unsettled condition of business during the earlier months of 1915, the above report shows that the NORTHWESTERN made, during the year, that steady, consistent and healthy growth which has become characteristic of it. The uncertainty attaching to other lines of business and other means of protection, has emphasized the necessity for adequate life insurance and the flexibility of the Policies of the NORTHWESTERN in meeting the demands of family, business or estate, the convenience with which they can be adapted to changing conditions and the conservatism and care exercised in the investment of funds and selections of risks, have made the NORTHWESTERN popular with careful buyers of insurance. The above figures are worthy of careful study, especially those showing payments to policyholders.

Geo. C. Markham
President.

Resolutions of Breeders.

State Live Stock Association Meeting Passes Set of Resolutions---Arthur Broughton the New President.

THE Wisconsin Live Stock Breeders' Association at its annual meeting held in Madison last week elected Arthur Broughton, of Albany, Green county, president, to succeed S. A. Baird, of Waukesha county. Mr. Broughton was most signally honored at Madison, having been the first sheep breeder to be chosen head of the state breeders' association, and having also been re-elected, by a unanimous vote, to succeed himself as president of the Wisconsin Sheep Breeders' Association. Earl Roberts, of Oconomowoc, was chosen vice president of the live stock association, and Andrew W. Hopkins, of Madison, was unanimously re-elected secretary. Mr. R. Baker will remain at the Madison office as assistant to the secretary and L. P. Martiny, of Chippewa Falls, will act as treasurer of the society for the ensuing year. Members of the executive committee chosen are J. C. Robinson, of Evansville, and W. L. Houser, of Mondovi. This association has done a splendid work in Wisconsin in unifying the work of the various breed organizations and spreading the gospel of "more and better live stock."

There has been considerable discussion in Wisconsin of late on the question of taxing pure-bred sires. It is an open question with strong adherents to each side of the argument. It was apparent at the meeting last week that the members of the organization are not in entire accord on the subject. At the suggestion of the resolutions committee it was decided to name a committee to investigate the topic and report the merits and demerits of the case.

Live stock marketing conditions are to be investigated by the association as evidenced by the following resolution which was passed:

Whereas, Competition has long been recognized as the essential principle of trade, prices being governed by supply and demand, and

Whereas, The central live stock markets give opportunity for large numbers of rival packers, shippers, butchers and feeders to compete in the purchase of live stock, and furnishes the producer with the only guide to current live stock prices that he has, and

Whereas, A system of country buying whereby it is said they are enabled to purchase with very little or no competition, causing a serious depression of prices on the open market by decreasing demand, and establishing prices which do not indicate the real supply and demand, be it

Resolved, That this association recommend the appointment of a committee by the executive committee to secure all possible information on live stock marketing matters.

A resolution was passed demanding cleaning and disinfecting stock cars, the expense thereof to be borne by the railroads. The breeders also endorsed the five-day market as the best method to secure more even distribution of shipments throughout the week. Other resolutions were passed as follows:

Resolved, That it is exceedingly unfortunate and regrettable that the last Wisconsin senate failed to provide an appropriation sufficient to partially reimburse Wisconsin exhibitors at the last National Dairy Show for expenses incurred because of the necessity of holding their cattle in quarantine for foot-and-mouth disease and that this association take the proper steps to place this before the next legislature.

Resolved, That there should be more effective and rational quarantine regulations, which would establish quarantine zones around infected premises at a safe distance as determined by scientific authorities, rather than establishing quarantine lines to conform to township, county or state lines. And, that after such quarantine is established, we favor strict co-operation with state and federal authorities in their enforcement. Be it further

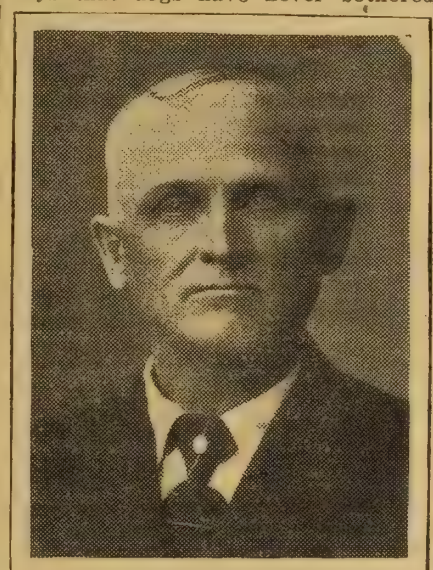
Resolved, That in case of infection of pure-bred herds with foot-and-mouth disease that slaughter or quarantine be decided upon the merits of the individual case, and be it further

Resolved, That we pledge our hearty support to the United States Department of Agriculture in any plans made for the efficient handling of a future outbreak.

Resolved, That we express the thanks of the association to the state live stock sanitary board for its efficient handling of the foot-and-mouth disease situation in Wisconsin.

Resolved, That this association favors and will support state and federal legislation which will allow of the appraisal of pure-bred live stock slaughtered on account of the foot-and-mouth disease to more nearly represent the reasonable breeding value of the animals slaughtered. And the said appraisal to be made by men familiar with the value of pure-bred live stock. Resolved, That this association co-operate with the United States Department of Agriculture and the Wisconsin Live Stock Sanitary Board in the maintenance of an official public record for all herds which can be certified as tuberculosis-free herds.

The Wisconsin Sheep Breeders' Association held its annual meeting and listened to an address by A. J. Knollin, of Chicago, an officer in the American Shropshire Breeders' Association and a sheep breeder of many years experience. Mr. Knollin hopes to see the time when the wool tariff will be taken out of politics and put on a business basis. He favors a protective tariff on wool, but says the worst thing that can happen to the sheep men is to have the subject constantly up for discussion and changed by every congress. He says President Taft's idea of a tariff commission was right and he approves President Wilson's stand on the same subject. Sheep raising at present is profitable notwithstanding the free wool law, and Mr. Knollin expressed the belief that it will continue to be profitable for several years. There has been a shortage of sheep offered for market and Mr. Knollin believes, government statistics to the contrary notwithstanding, that there is an actual shortage in flocks of the country. Several practical suggestions were offered. One breeder said that in fifty years he had had no trouble with dogs. He has kept a shepherd dog and has allowed his sheep to run in pasture with dairy cattle and colts. Another breeder says that dogs have never bothered



ARTHUR BROUGHTON, ALBANY.
Chosen president Wisconsin Live Stock Breeders' Association.

him and he attributes this to the fact that he keeps a goat or two always with his flock.

The association elected the following officers: President, Arthur Broughton, of Albany; vice president, Seth L. Crall, of Evansville; secretary, W. F. Renk, of Sun Prairie; treasurer, George Phillipi, of Welcome. The new directors are William T. Miles, of Oregon; W. C. Bradley, of Hudson; George McKerrow, of Pewaukee; Frank L. Kleinheinz, of Madison, and R. E. Richards, of Lodi. After some discussion the association recommended that the officials of the Wisconsin State Fair select two judges for the 1916 fair, for the mutton breeds, from among the following: John Miller, of Toronto, Canada; Noel Gibson, of Illinois; James Duncan, of New York; William A. Dryden, of Brooklyn, Canada; James Hammond, of Ames, Iowa; John E. Webb, Southport, Indiana; Willia S. Dixon, of Connecticut; C. E. Lockwood, of Michigan. Prof. E. L. Shaw, of Washington, seemed to be first choice of the breeders for one of the judges, provided his services can be secured.

The Wisconsin Horse Breeders' Association at its annual meeting held in Madison last week unanimously re-elected its former officers, who are as follows: President, W. K. Caldwell, of Morrisonville; vice president, James Boyd, of Milwaukee; secretary and treasurer, J. G. Fuller, of Madison.

This association has lost two of its members since the last meeting two years ago by death. Appropriate resolutions concerning the lives of James Z. McLay, of Janesville, importer and breeder of Clydesdales, and R. C. Lybrand, of Richland Center, breeder of Percherons, will be spread upon the permanent records of the society.

Dr. A. S. Alexander, veterinarian at the University of Wisconsin College of Agriculture, and Professor Edmunds, of the Illinois station, addressed the meeting. Dr. Alexander said that the war had helped the horse breeders in that it had taken 600,000 horses and mules, of the grade stock, away from this country and had depleted our supply and at the same time left us in possession of the best.

Mr. James Van Etta, of Lima Center, was chosen on the board of directors to succeed the late James Z. McLay.

A horse show is proposed hereafter at the close of annual short course. Such a show was formerly held. It is also proposed to have an annual sale of draft horses in November. While the horse men have met some discouragements in the past two years, they are optimistic regarding the future of the horse business in Wisconsin and the nation.

The Pleasant Hill Creamery Company, Wood county, had the biggest year in its history in 1915. The annual report shows a butter production of 117,416 pounds from 98,609 pounds of butter fat. F. A. Fox was chosen president and Peter Hansen secretary for the coming year.

Avery Tractors for Any Sized Farm.

ONE reason why there are more acres plowed by Avery tractors and plows than by any other make is because they are made in six sizes, one of which is adapted to any farm in the country, no matter whether it is large or small. Avery tractors are operated by one man and they work with economy of time, labor and expense. In their advertisement on page 18, the Avery Co., gives six good reasons why so many farmers are buying Avery outfits, including tractor, plow and thresher, all built and backed by this old, reliable concern. In writing for the 1916 Avery catalog, which gives full information about the big Avery line, address Avery Co., 1315 Iowa St., Peoria, Ill., and please mention this paper.—Adv.

Pay Nothing In Advance

First Small Payment In Three Months

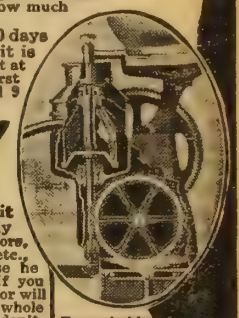
This is the most sensational bargain offer ever made on a Cream Separator of absolutely guaranteed high quality. The **House of Hartman** with its 60 years business record and $10,000,000 resources is behind this remarkable Separator, which is offered direct-to-you on the famous **Hartman Special Farm Credit Plan**—the most liberal credit terms ever devised.

PAY NOTHING IN ADVANCE. Not a penny down, no deposit, no "red tape" of any kind, no security, no interest. Just let **Hartman** ship you a **Majestic** Cream Separator for free trial, so that you can prove for yourself what it will do. Test it with warm and cold milk. See how easily it runs—how simple and satisfactory—how it skims right down to the last drop—how much quicker it does the work.

Just use the **"Majestic"** as your own for 30 days and, if you are not perfectly satisfied that it is the best Separator bargain ever heard of, return it at our expense. If you decide to keep it, make your first small payment in 3 months, and balance in 3, 6 and 9 months thereafter, giving you

A YEAR TO PAY Without Interest

This is the famous **Hartman Farm Credit Plan** on which you can buy not only Cream Separators, but also Engines, Incubators, Paint, Roofing, Furniture, Carpets, Rugs, etc., etc. **Hartman** trusts Farm Folks because he believes in them. Your credit is good. If you prefer, you may pay all cash, but the Separator will be no cheaper in price. It costs you nothing extra if you take a whole year to pay. If you are thinking of buying a Cream Separator, don't do it until you let **Hartman** ship you for free trial the wonderful



Remarkable Inside Oiling Device—No Outside Oil Cups—All Gears Encased.

Majestic Cream Separator

375, 500, 750 and 1,000 Pounds Capacity

A masterpiece of mechanical skill—a Separator so ingenious in design, so perfect in construction, so simple and easy to operate—that it will measure up in all 'round efficiency with Cream Separators that sell for practically twice the **Hartman** low direct-to-you bargain price. The **"Majestic"** has all the very latest improvements, including a remarkable inside oiling device that keeps the gearing perfectly lubricated and prevents any trace of oil coming in contact with the cream. The **Majestic** Separable Disc Bowl is the simplest, most accessible and easiest to clean of any Separator Bowl made.

Wonderful Offer

Send for This Free Book

We want you to learn all about the wonderful Majestic and compare our low price with prices of cheaply constructed, inferior makes. Dairy Rations Containing Silage.

To Get the Most Profitable Returns from the Use of Silage it Should Be Fed in Connection With Other Feeds.

ARGUMENTS are no longer needed to convince the farmer that silage is a good feed for cattle, regardless of whether they are kept for milk or beef. A few years ago beef producers, while they conceded that silage might be all right for the dairy and beef breeding cow, it had no special value for the fattening steer. But these men have now learned from experience that silage is as valuable for the steer as for the cow. The fact that by converting the corn crop into silage we save all its food value—40 per cent of which is represented in the stalks and leaves—is such an important item that no one can afford to overlook it. The question of how to feed silage to the best advantage, however, is not so well understood as the fact that it is an economical feed, even when not fed strictly according to the scientific principles underlying the use of all feeding stuffs.

Since this article is especially intended to discuss the feeding of silage to dairy cows, rations for other stock will not be mentioned, although it is just as important for the beef producer to use silage judiciously as it is for the dairyman or the farmer who feeds it to his milk cows, from which he is anxious to obtain a steady cash income the year round. There is a tendency among a good many farmers to use silage as a substitute for hay. This is all right in a way, but it should be used with other feeds in such a manner as to produce a balanced ration. The milk of a cow is rich in protein; it forms a perfectly balanced ration for the young calf, as everyone knows. Nature intended that it should and a young calf, like any other young animal, requires a large amount of protein and mineral matter so that it may build up its body rapidly and in a normal manner.

By bearing this fact in mind—that milk is rich in protein—it is not difficult to understand why a dairy cow must have feed rich in that same constituent. This becomes clearer still when we realize that protein in milk can be produced only from protein. The cow, therefore, to make protein for her milk must take protein either from the food she consumes or rob her own body of that constituent. She can continue robbing her body for only a comparatively short time and keep up a good milk flow; hence it follows that if she is to produce profitably she must be given a ration containing the necessary constituents needed for that purpose. Just as we must supply the mason with brick and mortar instead of with lumber and nails if we want him to build a brick house, so must we also supply the cow with the proper amounts of protein and carbohydrates if we want her to produce a large flow of milk.

The question then arises, What does the cow need in the way of these nutrients—protein and carbohydrates—in order to produce a certain amount of milk: Is that known? Certainly it is. It has been worked out very definitely by keeping records of the amounts of these nutrients fed to cows together with the amount of milk produced therefrom, and that is why it is now possible to compound rations for milk cows from all sorts of feeding stuffs and obtain economical returns therefrom, provided the cows are of the right kind. So well have these things been worked out that any farmer can learn to provide a balanced ration for his cows and feed each cow according to her capacity or her ability of converting food into milk.

There is only one difficulty in the way of the average farmer making up his own dairy cow rations and that is his lack of knowledge of the chemical composition of feeding stuffs. This, in fact, is our excuse for writing this article and appending a number of balanced rations thereto, which may at least serve as excellent guides.

It has been learned that a 1,000-pound cow, in order to maintain her body at an even weight when not producing milk, requires seven-tenths of a pound of digestible protein and seven and two-tenths pounds of digestible carbohydrates and fat. Whatever additional feed she consumes can be utilized for the production of milk or the increase of body weight. A first-class dairy cow, however, will not lay on body fat while she produces milk, but will convert all food consumed above the amount needed for body maintenance, into milk.

Just as it is known how much protein and carbohydrates a cow needs for body maintenance so it is also known how much she needs in order to produce a given quantity of milk of a certain richness. Thus a 1,000-pound cow, producing thirty-two pounds of four per cent milk—three gallons—a day requires 2.35 pounds of digestible protein and 15.03 pounds of digestible carbohydrates. The following rations all contain approximately those amounts of nutrients, and are therefore suitable for use:

RATION 1.

Feeding stuff	Protein Lbs.	C. H.* Lbs.
65 lbs. silage	.58	3.42
3.5 lbs. cottonseed meal	1.32	1.51
6.5 lbs. corn	.43	4.69
	2.33	14.62

RATION 2.

40 lbs. silage	.36	5.12
8 lbs. alfalfa	.89	3.21
1.5 lbs. cottonseed meal	.56	.65
8.5 lbs. corn	.57	6.13
	2.38	15.11

RATION 3.

30 lbs. silage	.27	3.84
10 lbs. alfalfa	1.11	4.05
1 lb. cottonseed meal	.38	.43
9 lbs. corn	.60	6.49
	2.36	14.81

RATION 4.

20 lbs. silage	.18	2.56
14 lbs. alfalfa	1.55	5.67
10 lbs. corn	.67	7.21
	2.40	15.44

RATION 5.

40 lbs. silage	.36	5.12
8 lbs. clover	.57	3.35
2.5 lbs. cottonseed meal	.94	1.07
7.5 lbs. corn	.50	5.41
	2.37	14.95

RATION 6.

30 lbs. silage	.27	3.48
10 lbs. clover	.71	4.19
2 lbs. cottonseed meal	.75	.86
8 lbs. corn	.54	5.77
	2.27	14.66

RATION 7.

20 lbs. silage	.18	2.56
14 lbs. clover	.99	5.87
2 lbs. cottonseed meal	.75	.86
8 lbs. corn	.54	5.77
	2.46	15.06

RATION 8.

40 lbs. silage	.36	5.12
8 lbs. timothy	.22	3.62
3.5 lbs. cottonseed meal	1.32	1.51
6.5 lbs. corn	.43	4.69
	2.33	14.94

RATION 9.

30 lbs. silage	.27	3.84
10 lbs. timothy	.28	4.53
3.5 lbs. cottonseed meal	1.32	1.51
6.5 lbs. corn	.43	4.69
	2.30	14.57

RATION 10.

20 lbs. silage	.18	2.56
14 lbs. timothy	.39	6.34
4 lbs. cottonseed meal	1.50	1.72
6 lbs. corn	.40	4.32
	2.47	14.94

RATION 11.

40 lbs. silage	.36	5.12
8 lbs. millet	.40	3.96
3 lbs. cottonseed meal	1.12	1.29
7 lbs. corn	.47	5.05
	2.35	15.42

RATION 12.

30 lbs. silage	.27	3.84
10 lbs. millet	.50	4.95
3 lbs. cottonseed meal	1.12	1.29
7 lbs. corn	.47	5.05
	2.36	15.13

*Carbohydrates.

The above rations all contain silage, but in varying amounts. Note that Ration 1 contains no roughage other than silage. In order to get such a ration in balance, a large amount of high-protein feed—cottonseed meal being mentioned—is required. Silage being deficient in protein it must be supplemented with something rich in that constituent. Suppose we have an abundance of alfalfa on hand, then we might use a combination as shown in Ration 3 and effect a saving in the cottonseed meal needed. In Ration 4 we show a combination for which no purchased feed is needed. This makes a very good ration for cows that do not produce large quantities of milk, but for a cow producing sixty-four instead of thirty-two pounds of milk a day it would not be suitable, for such a cow would need more concentrates as she could not eat enough alfalfa to secure the amount of protein needed for the production of such a large quantity of milk. Now contrast Ration 4 with Ration 10, in which timothy is substituted for alfalfa. Note that in this case four pounds of cottonseed meal are required as compared with none of that constituent in Ration 4. This shows clearly the superiority of alfalfa over timothy as a feed for dairy cows. Also study Rations 8, 9, 11, 12, none of which has alfalfa in its make-up; hence all require relatively large quantities of a protein feed.

"Velvet" For Dairymen

West Chester, Pa.

February 3rd, 1916.

Mr. Dairyman:

We have a wonderful new invention and I want to tell you about it myself. It is a source of new profit for dairymen without added expense which I call "velvet," for it is *all profit.*

Thirty-five years, longest in America, the Sharples plant has been devoted exclusively to the Cream Separator.

Its inventors produced the first cream over-flow bowl with its superior quality of smooth even cream, the first directly driven steam Separator, saving power, fuel and wear, the first and only tubular bowl with its doubled skimming force and efficiency and extreme simplicity, the bottom feed, the hanging tubular bowl, all making for convenience, durability, economy of maintenance and operation.

Now we have made another great invention, greatest of all as a profit producer, though so simple that it seems we should have had it long ago.

Thousands of carefully made observations by competent investigators, government officials and scientific men have proven beyond question that 95% of all the hand driven cream separators in America are turned below regulation speed, below the speed marked on the handle, a great part of the time and *every* hand separator is under-speeded *some* of the time.

No matter which separator, whose make, or what it is capable of doing when turned at full speed, it will lose cream and a lot of it, when the speed is allowed to drop even for a moment, and with the cream goes the profit.

THE NEW
SHARPLES
SUCTION FEED

Separator will stop this loss, aggregating millions of dollars annually to America's dairymen—stop it at once and forever.

No matter if you turn this Separator at widely varying speeds, fast or slow, it skims equally clean—no cream will be lost. The bowl *drinks its milk supply as it needs it,* always in exact proportion to the separating force within the bowl. At slower speeds it drinks less, at faster speeds more, but always just the right amount for *clean* skimming.

A thousand of these machines are in regular daily use; we demonstrated them to a finish before announcing them; it is the Sharples way—*absolute perfection before sale.*

The Sharples Suction Feed Separator has several very important advantages in addition to its certainty of clean skimming at any speed. The varying of speed does not change the thickness of cream; fast turning increases the capacity much above normal, just as you whip up a horse, when in a hurry. The supply can is but knee high and the machine throughout is simpler and better than ever.

We sell our Separators now, as always, subject to free trial by the buyer; but a stronger guarantee than any trial is the unbroken record of the growth of this business from the small beginning of 35 years ago to its immense proportions of to-day. It could not grow so except by the unbroken rule of complete satisfaction to customers.

Lack of space prevents explaining more fully; but send today for new book, "Velvet for Dairymen," that tells all about this money-saving invention.

Sincerely yours,

P. M. Sharples

President.

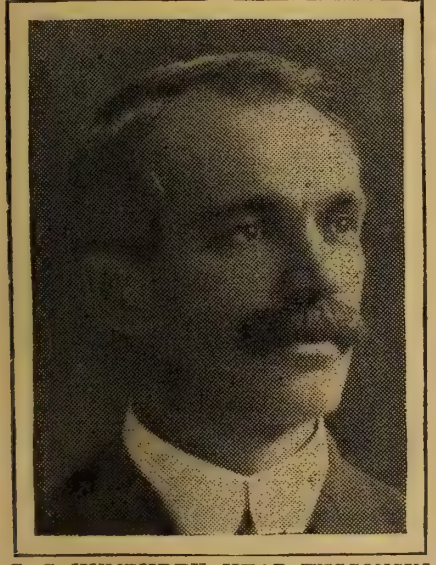
PROMINENT FARMERS' WEEK

E. J. DELWICHE, WISCONSIN EXPERIMENT STATION.

B. G. PACKER, OF STATE IMMIGRATION BUREAU.



G. C. HUMPHREY, HEAD WISCONSIN ANIMAL HUSBANDRY DEPT.

WISCONSIN FARMER CORN TROPHY.

The above silver loving cup was offered by The Wisconsin Farmer this year to the member of the Wisconsin Agricultural Experiment Association who took first honors for the best fifty ears of White Dent corn. Mr. S. P. Markle, of La Crosse county, with Silver King variety corn won sweepstakes on white corn, and his exhibit was generally spoken of as one of the best ever shown in the state. Mr. Markle also won honors at the recent National Corn Show in St. Paul with his exhibits of white corn. He is well known throughout Wisconsin because of his exceptionally good work in corn breeding. Mr. Markle has won many honors at the La Crosse County Agricultural Experiment Association annual exhibit. He is one of the company of Wisconsin men who have worked hard to produce good grains, and his labors have been generously rewarded with success.

The Wisconsin Farmer is advised that there are approximately 1,000 bushels of good seed corn in La Crosse county. While this is below normal it is somewhat better than was at first supposed. The price of seed corn is running from $4 per bushel up. An effort is being made to keep all seed corn for sale by experiment association members at the $5 per bushel mark, but when growers have exceptionally good seed corn for sale the bidding for it is so active that the price is bound to be higher. The farmer who has good seed corn to sell is indeed fortunate.

No Other Tractors and Plows Have Met Such Tests

AVERY Tractors and Plows have met the test of actual field use in the hands of owners so successfully that there are more acres plowed by Avery Outfits than by any other make. They have also met the test of competitive contests. Have been entered in every important demonstration ever held. Also met the hardest test of all—introduced by a sold-on-approval policy.

Learn All the Facts About the Avery Outfits

Sliding frame; two-speed gears; double drive; slow-speed special tractor motor, extra large crankshaft, renewable inner cylinder walls; no pumps or fan. Another big advantage in getting an Avery Outfit is that the entire outfit is built by one company—the plow as well as the tractor. You can also get a "Yellow Fellow—Grain Saver" Separator in sizes to fit each size tractor. Built in sizes to make Tractor Farming successful on any size farm—large, medium or small. Also best power for threshing and road building. 3-plow tractor, $760, cash; 4-plow, $1120, cash; 5-plow, $1680; 6-plow, $2145; 8-10-plow, $2475. We also build a special smaller size tractor for $295. All built and backed by a company having a large factory and many branch houses which insure prompt and permanent service. **Write now for new 1916 Avery Catalog.**

As Viewed at the Stockyards.

An Address by James E. Poole, of Union Stockyards, Chicago, Before Wis. Live Stock Breeders' Association.

WISCONSIN'S contribution to the beef, veal and pork supply of the country is by no means inconsiderable. In volume it ranks behind such states as Iowa, Illinois or Missouri, but it enjoys the distinction of marketing in large quantities the costliest raw materials the packers buy, veal. The Wisconsin hog enjoys an enviable reputation at the market. It figures well on the dressing sheets and but a small percentage of the crop fails to pass the post-mortem test. The Wisconsin hog is a healthy animal and less susceptible to tuberculosis than his Iowa prototype. Although not noted for its beef cattle, Wisconsin contributes a large quantity of grass product, the fall run from the blue grass region of the southwestern part of the state having recognized market standard. That this state markets only a handful of native sheep is to be deplored. That it might be the home of an important wool and mutton industry is indicated by the occasional arrival of a prime load of native lambs at Chicago that top the market. In a live stock sense Wisconsin is a region of but partly developed and almost unlimited possibilities. With a beneficent climate, fertile soil and advantageous location as to markets, enjoying the unquestioned benefit of short hauls, light shrinks and low freight rates, it is a safe prediction that within the next decade its production of cattle, hogs and sheep will be materially augmented.

Logical by-products of the dairy herd are beef and pork. But for the butcher cattle that come annually to the stockyards from Wisconsin's dairy yards the beef of the common people would cost considerable more money. Wisconsin is essentially a farm home state where the agriculturist does not carry "all his eggs in one basket." The farm that produces milk, butter, eggs, cheese, veal, pork and a little beef is a much safer proposition than that which specializes. Wisconsin is a region of comfortable farmsteads, capacious schoolhouses, busy and prosperous towns and contented people with an appreciation of comfortable living. Its system of mixed husbandry furnishes employment to the entire family the year around.

Some years ago an Iowa man came to Chicago with a load of Hereford yearlings. It was just before the Christmas holidays when such cattle always find a good market. They weighed right around 1,000 pounds and realized $9.90 per hundredweight. Asked what profit he figures on the transaction, he replied: "Why, that's all profit. I never had a cent of that money before and I never missed what those cattle ate. They just grew up on the farm, ate what it produced and about the only trouble they gave me was salting 'em." While his figuring was fallacious it was in a measure correct. That load of yearlings was really a farm by-product, the result of a system of diversified farming, and in that respect Wisconsin has a decided advantage over the corn belt when its live stock goes to market. The stuff being home raised the speculative element in the transaction is eliminated.

The beef cattle Wisconsin sends to Chicago are not of the blue-ribbon variety. In market parlance these are known as "knotheads." Thousands come annually from the north country in the yearling stage weighing around 500 pounds and selling as low as 4 cents per pound, which means about $15 per head net to the grower. Sent to the shambles in the veal stage they would have netted nearly as much and the risk and expense incidental to wintering would have been avoided. Maturing such cattle is obviously unprofitable.

From the eastern and southern sections of the state a continuous procession of calves and such cows as the trade knows as canners and cutters troop to the stockyards. But all Wisconsin cattle are not trash. Such counties as Grant, Crawford and Richland contribute stockers and feeders that have an excellent reputation among finishers in Ohio, Indiana, Pennsylvania and other eastern territory. Better sires might be used, and the fact that Wisconsin grows such cattle suggests possibilities of expansion of the industry. Good stockers from Crawford and Grant counties have commanded $7 to $7.25 per hundredweight at Chicago, while the "knothead" class has had to take $4 to $4.25. Growing stock cattle is now a remunerative business and along this line of production Wisconsin, by reason of its proximity to market and eastern feed lots, has unquestioned opportunity.

Feeders in Indiana, Ohio, Pennsylvania and southern Michigan have been forced to travel long distances to secure young cattle at great expense in the matter of shrinkage. Ontario is now depended on to replenish Pennsylvania feed lots and that state is sending a large sum annually to eastern Canada for raw material. Wisconsin could increase its production of yearling stock cattle enormously without taxing the capacity of the market. Despite the contention of theorist to the contrary, it is not, and probably will not be, the logical function of high-priced corn-belt land to grow stock cattle which can be more economically produced on cheaper areas, capable of growing roughage. Carrying a cow for the calf it raises is a maintenance ration proposition and offers one of the most lucrative and safest spheres of beef production. Wisconsin has millions of acres adapted by nature for that business.

At the market Wisconsin's grass cattle are well thought of. Most of them come from a rolling area in the southwestern part of the state, mainly Grant, Crawford and Iowa counties, and in stockyard parlance are known as "Mineral Point cattle." They are strictly grassers and many sell at $8 to $8.50 per hundredweight.

Growers in that section of the state have in recent years experienced the same difficulty as beef makers everywhere in securing store cattle at a price that insures a reasonable margin and the grazing section of the state is under the necessity of buying inferior western stock cattle at St. Paul, owing to deficiency in local production.

Slaughter records demonstrate the healthfulness of the Wisconsin hog. The swine industry of the state is to a large extent a side line, the by-product of the dairy industry. Most of the crop goes to Chicago and Milwaukee, where the Wisconsin hog enjoys an enviable reputation. Both as regards cholera and tuberculosis the Wisconsin hog outfigures corn-belt product in the post-mortem test.

Wisconsin boasts of one of the most efficient experts in the United States, but his efforts to put the wool and mutton industry on its feet have not produced results. I refer to Frank Kleinheinz, of the state experiment station. There are other practical Wisconsin sheep raisers engaged in constant demonstration that the business is profitable, but somehow or other Wisconsin refuses to avail itself of this opportunity. Between dogs, parasites, bad markets and other adverse influences, what the trade knows as the native sheep in contradistinction to western product is becoming less numerous annually and the 1916 lamb crop east of the Missouri river will be the smallest in a quarter of a century. Sheep need shepherding and this essential care the average farmer is not disposed to give.

Wisconsin could, and ought to, produce as much wool and mutton as Idaho, but that accomplishment will never be possible on a small farm flock basis. Cattle and hogs are able to take care of themselves to a large extent and are farm by-products, but if ever the sheep is to gain substantial foothold in Wisconsin or its neighboring states it will be as a district special industry. Such men as Arthur Broughton have made discussion of that topic unnecessary. Wisconsin has the climate, the soil and the feed capacity to market $25,000,000 worth of wool and mutton annually.

A fine farm from $400 and 3 cows

Beginning with $400 and three good cows Thos. Bently has developed a fine farm near Paragould, Ark. worth several thousand dollars now. Wherever you go along the

Cotton Belt Route in Arkansas & Texas

you'll find hundreds of farmers, now well to do, who started just a few years ago with only a little cash.

As H.V. Tull, near Jonesboro, Ark. says "One can start farming here on less capital than anywhere else I have ever been. We paid $25 per acre for this land and made a good crop the first year."

S. M. Jackson, of Piggott, Ark. had the same experience. "We came here a few years ago from Tennessee and bought this place for $700 and have been making money all the time. There is more money here and a better market. Our garden and orchard crops bring us money every month of the year; and our field crops and pastures support our live stock." Down near Jacksonville, Tex., B. E. Barber bought 40 acres of land a few years ago for $365. The first year his crops brought a revenue of over $2000—and in four years time he put $12,000 in the bank from the sale of products raised on his farm, mostly by his own labor.

If you could talk with the farmers from Iowa, Michigan, Illinois, Kansas—from every part of America—who have gone into Arkansas and East Texas with little capital and made good money from the start, you'd realize what your opportunity is there.

Two free books!

A farmer wrote them; and he knows what you want to know about a section new to you. They tell about the character and cost of lands, climate, crops raised, etc., and about schools, churches, towns, social conditions. Brimful of photograph pictures taken on the ground. Send me your name and address on a postal card today and get these free books now.

Western Guernsey Breeders Meet.

More Than a Hundred Breeders Present at Annual Convention---H. W. Griswold Chosen President.

MORE than a hundred Guernsey breeders from Wisconsin, Illinois, Iowa and Minnesota attended the annual meeting of the Western Guernsey Breeders' Association at Madison last week. The meeting was held during Farm and Home Week and was one of the most interesting winter meetings ever held. Business has been good the past few months; the inquiries for stock are coming in rapidly and the breeders at the meeting in their addresses reflected optimism for a prosperous year.

A banquet was served at noon, followed by the business meeting at which officers were elected and other important matters discussed. Pres. Frank E. Fox, of Waukesha, presided and the report of the secretary showed the association is in a flourishing condition. The secretary reported that there are now 160 annual members, fifty-six life members and fourteen honorary members, and as twenty-one new members were received at the Madison meeting the total membership is now 251, which is a satisfactory increase over last year. The secretary also reported that there is in the treasury a balance of $439.12.

H. W. Griswold, of West Salem, Wis., a former president, was chosen president and Mr. C. L. Hill, of Rosendale, Wisconsin, was re-elected to the position of secretary and treasurer. O. W. Lehmann, of Woodland, Ill.; George P. Grout, of Duluth; Minn., and Charles Wilkins, of Plattville, Wis., were elected vice presidents. Gavin McKerrow, of Pewaukee, and George C. Humphry, of Madison, were chosen members of the executive committee.

Twenty-one new members were elected as follows:

O. K. Spires, Burlington, N. D.; A. E. Rundell, Plattville, Wis.; J. S. Govin, Menomonie; F. K. Babson, Chicago; George Higginson, Jr., Winetka, Ill.; George W. Brown, Waukesha; Conrad Kuhtz, Waukesha; George Westercomp, New Albany; Dr. F. F. Bowman, Madison; N. I. Anderson, Cambridge; G. R. Jones, Wales; George Nicholson, Brooklyn; C. H. Dayton, Oshkosh; Spencer Otis, Barrington, Ill.; D. L. Larey, Dousman; Dale Rundell, Plattville; F. D. Couriss, Lake Geneva; W. D. Hall, Big Stone City, S. D.; Enoch Perry, Milwaukee; George Goetz, Chicago, Ill., and Homer Rundell, Plattville, Wis.

The secretary reported that he had several inquiries on hand for stock and that he had been asked to supply for an outside shipper a half dozen cars of good grade Guernseys. He also has calls for calves and for yearling heifers and calves at about $150. The inquiries have been coming much faster of late, which indicates a good selling season.

W. E. Skinner, general manager of the National Dairy Show, was one of the principal speakers and he went into detail in explaining the removal of the 1916 show to Springfield, Mass. He said that the show committee had never been approached with a better offer by a better bunch of boosters and that he had every reason to expect the 1916 show to be a record breaker and that it would renew that interest in dairying in New England which is now a crying need. He said that Springfield has ample hotel accommodations to take care of the crowds and that a fund of $500,000 was being raised to take care of the show and insure its success. Thirty-nine men have already pledged themselves for $10,000 each, he said, which tends to show the interest and enthusiasm shown by the Springfield business men. He urged every Wisconsin breeder to exhibit, and said that he wished the western breeders to show the eastern breeders who were boasting that they would "clean up" this year; that the East has nothing on the West in dairy stock. He also spoke of the work of the National Dairy Council and its plans for an advertising campaign to increase the consumption of milk and dairy products. The association passed a resolution approving the work of the council.

Dr. T. W. Brophy, of Chicago, proposed that the association express itself in favor of a rule that every animal shown at the national dairy show be required to have passed an examination under the direction of state or federal authorities and that every exhibitor be required to file this bill of health with his entry. This brought on considerable discussion and the general opinion was that it was a wise move. The members who had had herds at the last dairy show, where they were quarantined because of the foot-and-mouth disease, were strongly in favor of health certificates for show stock, and some said they would never show again until such requirements were insisted upon. Dr. Brophy said in his opinion nothing will do more to clean up the herds and keep them clean than the requirement that owners secure bills of health for stock before showing. The incentive among the pure-bred breeders will be to keep their herds clean, and this would have the effect on the farmer of impressing upon him the importance of healthy herds.

Finally Dr. Brophy moved that the association favor the requirement of health certificates from all animals shown at all state and district fairs, as well as the national dairy show. The motion carried after some discussion as to whether county fairs should be included.

Dr. L. A. Wright, a Guernsey breeder in Columbia county and a member of the Wisconsin Live Stock Sanitary Board, explained the plan of the state department of agriculture for a certified list of herds free from tuberculosis. M. L. Welles, of Rosendale, was chosen as delegate to represent the association at the state conference to adopt rules and regulations.

W. S. Dexter, of Kenosha, spoke on the value of Guernsey milk and told of his success in building up a fine herd in thirty years by the use of pure-bred Guernsey sires. To his mind one of the greatest boosts ever given the dairy industry of Wisconsin was when the first Guernsey cow was imported. He started with a herd of red, native cows, and says that he has always been able to find a market for his milk and cream in Chicago; a market for his young stock and that 75 per cent of his young sires have gone into low-testing herds. The future of the Guernsey breeding industry, he predicts, is very bright.

L. P. Martiny, of Chippewa Falls, and H. W. Griswold, of West Salem, spoke on the effect of the show ring on the Guernsey industry.

$2 Brings You This Big LIFE-TIME GUARANTEED NEW BUTTERFLY Cream Separator

On 30 Days' Trial

At Our Risk. Then if pleased you can keep it and pay only a little each month out of your extra cream profits until the machine is paid for. In this way the separator itself will earn its own cost—and more before you pay. You won't feel the cost at all. If you do not need a large capacity machine you can obtain a smaller one on payments as low as

Only $2 a Month

No Interest To Pay—No Extras

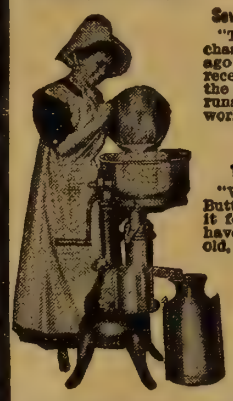
The prices we quote include everything. You have no extras to pay—no interest. You buy direct from the manufacturer and save nearly half. We give 30 days' trial on your own farm. During this time if you don't find the New Butterfly the lightest running, easiest cleaning, and best all around separator on the market (regardless of price) you don't need to keep it. Just send it back at our expense and we will refund what you paid, including all freight charges both ways.

Top of Milk Tank is Only 38 in. From the Floor

Skimming Device Made of Aluminum One-piece Easily Cleaned

Used on More than 50,000 Farms

Over 50,000 New Butterfly Cream Separators are now in use. No doubt some of them right in your own neighborhood. We have been advertising in this paper for years — the publishers know us and know we do just as we agree. Read these letters from just a few of thousands of satisfied owners:



Seven Years Old—Runs Like New

"The Butterfly Separator we purchased of you about seven years ago is still doing fine work. I recently took it apart and cleaned the gears with coal oil. Now it runs like a new machine and works as well as ever."
H. S. Stonebraker,
Kokomo, Indiana.

Twelve-Year Old Girl Runs It

"We would not do without our Butterfly Separator or exchange it for all the other machines we have seen. Our little girl, 12 years old, runs it like a clock."
Mrs. P. E. Rude,
Ashland, Wis.

Made $61.39 More From Same Cows

"We made $78.61 worth of butter before we had the machine and in the same length of time, we made with the Butterfly Separator $140.00 worth of butter from the same number of cows."
Thos. S. Kermosky.
Point Aux Pius, Mich.

Lighter Running and Easier to Clean

"We don't see how we got along without the New Butterfly as long as we did. It runs lighter, is easier washed and kept clean than the higher priced machines in this neighborhood."
R. E. Morrison,
Ollie, Mont.

New Butterfly Cream Separators are the only ones having the patented one-piece aluminum skimming device, very easy to clean. Light-running vertical shafts; frictionless pivot, ball-bearings bathed in oil, low down, self-draining milk tank; closed drip-proof and dust-proof bottom. Simplest and most sanitary machine on the market.

POULTRY DEPARTMENT

THIS department is edited by a competent poultryman, who will be pleased to answer questions concerning disease, poultry management, etc., when they can be answered through the department. Questions will not, however, as a rule, be answered by mail, and stamps need not, therefore, be inclosed with inquiries. Address all letters relating to poultry topics to this office.

COMMON POULTRY DISEASES.

In his address Farmers' Week, B. A. Beach, of the Wisconsin Station, discussed some of the common forms of poultry diseases. Fowl tuberculosis, he said, has existed in European countries for many years, but the disease was not sufficiently recognized in this country until 1900. All birds are susceptible, though the disease makes its worst ravages among domesticated birds such as chickens. Poultrymen and farmers sustain far greater loss from this than from any other disease, according to Mr. Beach. The presence of tuberculosis in the average flock means its ultimate annihilation. The disease is caused by a germ. These germs, in the process of growth within the body, interfere with the functions of some of the internal organs. Flocks become infected by the introduction of infected birds, also by the association with other flocks where there are diseased birds. The purchase of infected birds in butcher shops and the feeding of the trimmings and offal may also be the means of transmission. The first noticeable symptom is heavy loss in weight, notwithstanding the appetite may remain good. The condition is spoken of by poultrymen as "going light." Lameness is a frequent symptom. The comb and wattles become pale. In the advanced stage of the disease the birds become lifeless and sit around all day and move very little unless compelled to do so. A laboratory examination of a suspected bird is the only sure method of diagnosis. The germs usually attack the digestive cavity and nodules light in color and ranging in size from the size of a pinhead to a quarter are seen. The usual size is about that of a garden pea. The liver is usually affected and is quite apt to be enlarged. The spleen and intestines are affected and the lungs rarely show lesions. Mr. Beach states that two investigators at the North Dakota station diagnose the disease by injecting tuberculin into the wattle.

Discussing the prevention and control, Mr. Beach urges great care in purchasing birds. Inquire from whence they came and the conditions under which they were raised. Strive to prevent association as much as possible with neighboring flocks and never feed the offal of birds purchased for table use. All birds in flocks known to be infected should be slaughtered. Market only those which show no lesions. Infected birds together with the litter from the poultry house should be burned and the houses thoroughly sprayed with a five-per-cent solution of some good coal tar disinfectant. All runs should be plowed where possible and cropped. No birds should be kept on the premises for a year.

Mr. Beach says it is still a disputed question whether roup and chickenpox are the same disease. Most investigators, however, agree with Mr. Beach's idea that they are separate diseases. The diseases are widespread and outbreaks occur in certain communities every year, though they are usually several years apart. The mortality is not high and in most cases if the birds are properly cared for their usefulness is unimpaired. The cause is believed to be a germ. The disease is spread by introduction of birds from infected flocks and at times from attendants passing from one flock to another. The symptoms include at first a general disturbance, loss of appetite, and a desire to sit on the roost undisturbed. The next symptom is usually, in roup, watering of the eye, followed shortly by swelling of the eyelids and pus around the eyeball; also pus patches in the mouth known as canker, a nasal discharge, and in chicken pox the appearance of pox scabs on the comb and wattles. Recovery usually occurs in ten days to three weeks. Outbreaks have occurred where the mortality ran from 80 to 90 per cent. When roup or chicken pox makes its appearance in a flock the affected birds should be isolated at once. All the remaining birds, Mr. Beach advises, should have their heads dipped in a solution of permanganate of potash made by diluting a saturated solution one to four with

water. The head should be held under only a few seconds. Boric acid powder should be put into the eyes of affected birds, the pus patches and pox scabs scraped off, and the areas painted with tincture of iodine.

FROM A SUCCESSFUL POULTRY BREEDER.

To the Editor:—I noticed in your issue of the 20th of January that someone wanted information as to which breed of chickens they should start out with. Having had about twenty years' experience in chicken raising and having tried several breeds in that time I would like to be of any help I can to other people who have had less experience.

If possible, get a start with an all-around chicken. By this I mean a good table fowl as well as a good layer. After trying out a good many breeds I have concluded the Orpingtons are the best, with Rhode Island Reds a close second if not as good. Either the White, Black or Buff Orpingtons will give anyone complete satisfaction if they are given half a chance. Take the color that suits you best in this breed. All do equally well.

First of all, do not get a single chicken until you have a good, clean, sanitary chicken house to put them in. Also do not overcrowd. This is one of the fatal mistakes of a beginner. Every fall sell or kill all roosters and get new cockerels, thus introducing new blood into your flock every year.

This will insure you healthy birds and make a better laying bunch, on an average, than if you try to inbreed.

Kill all sick birds the minute you discover their condition. Have the house warm and properly ventilated. Clean at least once a week. Give grit, such as oystershell and charcoal, in winter. Feed cabbages and beets, also in cold weather try giving them alfalfa steamed with hot water, at least twice a week.

Now a word about your little chickens. In order to be a successful chicken man of course you must not lose the young chicks. I think the feed has a good deal to do with chickens dying when they are little. The reason why some people lose so many young chicks is because they start in to feed heavy grain of all kinds before the chicks' digestive organs are able to take care of it. Because of this one mistake many chicken raisers lose from 40 to 60 per cent of their little chickens before they are four weeks old. I have raised hundreds of little chickens without the loss of a single chick, except by accident. I feed no grain at all until they are from six weeks to two months old. Do not give the chicks any feed until they are at least twenty-four hours out of the shell. Forty-eight hours is still better. The yolk of the egg is already in the chick when it is hatched and it should be given time to digest the food provided by nature before any other food is taken in. If the chicks are fed before they are two days old it does more harm than good. For the first feed I give hard-boiled eggs and boiled potatoes. Be sure to boil the eggs hard and break them up. Feed the little potatoes which otherwise you would throw away, but if you have no little potatoes feed the big ones. It is cheap feed at that, and good too. If this plan of feeding is followed the chicks will have no bowel trouble and you will have the healthiest and fastest growing bunch of chicks you ever raised. The chicks should be kept on the ration of hard-boiled eggs and boiled potatoes for at least six weeks, then grain may be fed.

It is not a good plan to crowd the young chicks at night. If you have 100 chicks you should give them to at least five hens. More than twenty chicks to a hen is crowding. Give each hen a box of her own. After the chicks are about two months old the hens may be taken away. Each bunch of chicks will roost in the same box where they have been kept with the hen. Do not have any bottom in the boxes, for the simple reason that it invites lice and mites, as the box will surely get dirty and it will be impossible to keep them out. Move the box at least once a week onto clean ground. It is only necessary to move it a few feet each time. Up to four weeks old, I put a little straw in the boxes in order to keep the chicks off the ground. By moving the boxes once a week and sprinkling kerosene on the ground where they are moved from you will not be troubled with lice.

You must get your own experience. You cannot get it out of books. One man will tell you to do so and so, another will say that is no good, and each one claims to have made a success. The only way that I can see to be successful in the poultry business is to:

Keep the houses clean.
Do not crowd.
Do not inbreed.

But above all things, be kind to your poultry. Make every chicken a pet, if possible. A pat on the head and a caress or two as you go through the flock have a wonderful effect. I have seen men go through their flocks with water and feed and kick the chickens right and left. These people can never make a success with poultry. Walk carefully when you go through the flock. Never scare your chickens if you can keep from it, as it will surely keep down the egg record. They will repay any kindness shown them tenfold. An Old Subscriber.

SURVEY IN MARINETTE COUNTY.

To the Editor:—Completion of a farm survey of Marinette county shows the annual value of farm crops is over $7,500,000, having doubled since the year 1910.

The acreage improved land has been greatly extended, and the yield per acre has been brought up surprisingly through diversified and dairy farming. Over 300 new families from Illinois, Iowa and other middle western states have located on Marinette county lands each year for five years.

The county now has 400 silos, over 100 having been built during the past year. Twelve will be built by new settlers during 1916, and over 150 will be built in older settled localities of the county. Many farms which have had one silo for years are building a second one.

Since 1913 the number of cheese factories and creameries has been increased from seven to seventeen, and the output of all in existence in 1913 has been greatly increased. Seventeen new rural schools were built during the year 1915.

From present indications it is believed over 500 new families will take up homes on Marinette county lands during 1916. Of these from fifty to 100 families will be from southern Wisconsin. Howard I. Wood.

It saves time in packing school lunches to do them always in the same place, with the lunch napkin, parafine paper, sharp knife and paper napkins all close at hand.

Tells why chicks die

Write today for the poultry expert's valuable free book, "White Diarrhoea and How to Cure It." This book contains scientific facts on White Diarrhoea and tells how to prepare a simple home solution that cures this terrible disease over night and actually raises 98 per cent of every batch. The valuable book is free. Send your name and address for it now. E. J. REEFER, 4482 Reefer Building, Kansas City, Mo.

POULTRY.

STRONG, healthy baby chicks or eggs for hatching, W. Wyandottes. Our White Wyandottes are utility birds and are not like some so-called utility stock that consists of birds culled from flocks raised for exhibition purposes only. If you want stock that will lay well you must breed them for that purpose. Come and see these birds, or write for catalog giving list of matings, records and prices. Pine Lake Poultry Farm, Chas. H. Benjamin, Mgr., Dept. 12, Hartland, Wis.

Ironclad TRADE MARK **Wins in the Two BIGGEST HATCHING Contests Ever Held**

Why take chances with untried machines when for only $10 we guarantee to deliver safely, all freight charges paid (East of Rockies), BOTH of these big prize winning machines fully equipped, set up ready for use? Why not own an IRONCLAD—the incubator that has for two years in succession won the greatest hatching contest ever held? In the last contest conducted by Missouri Valley Farmer and Nebraska Farm Journal, 2,000 Machines were entered including practically every make, style and price. With 140-egg Ironclad—the same machine we offer with Brooder freight paid, for only $10, Mrs. C. F. Merrick, Lockney, Texas, hatched 148 chicks from 148 eggs in the last contest.

140 EGG Ironclads are not covered with cheap tin or other thin metal and painted like some do to cover up poor quality of material. Ironclads are shipped in the Natural color—you can see exactly what you are getting. Don't class this big, all metal covered, dependable hatcher with cheaply constructed machines—and don't buy any incubator until you know what it is made of. Note these Ironclad specifications: Genuine California Redwood, triple walls, asbestos lining, galvanized iron covering, galvanized iron legs, large egg tray, extra deep chick nursery—hot water top heat, copper tanks and boiler, self regulator, Tycos Thermometer, glass in door, set up complete ready for use and many other special advantages fully explained in Free Catalog. Write for it TODAY or order direct from this advertisement.

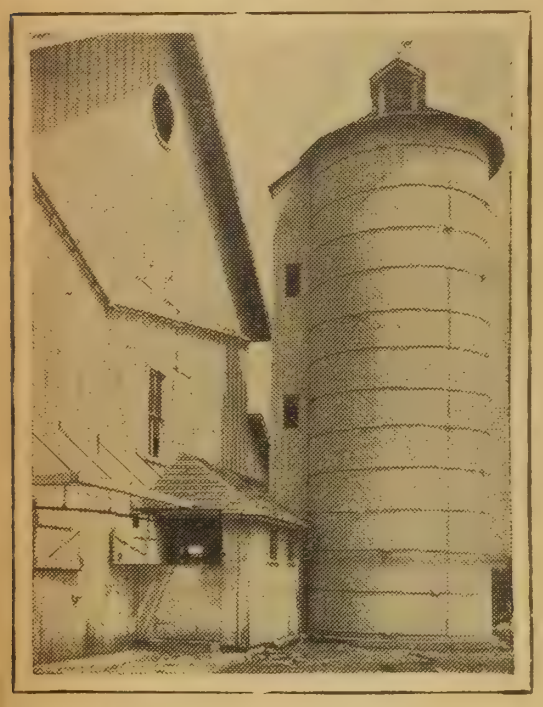
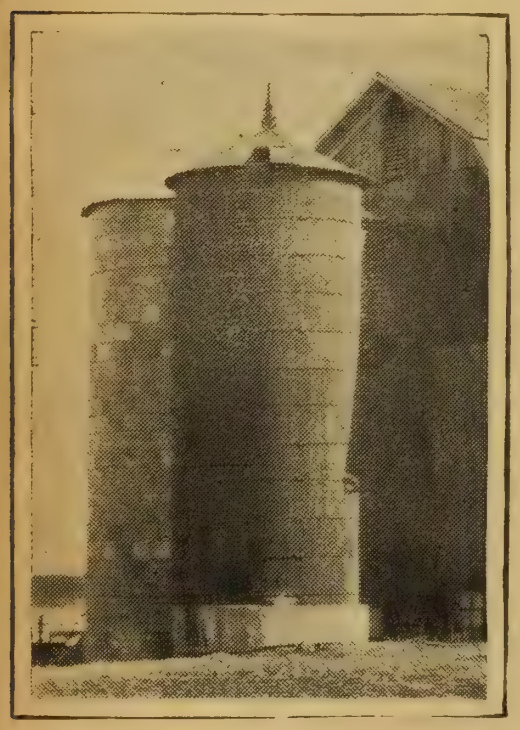
A Few Good Types of Silos.



A GOOD TYPE OF WOOD SILO.
Silage keeps well in all kinds of weather in a wood silo.

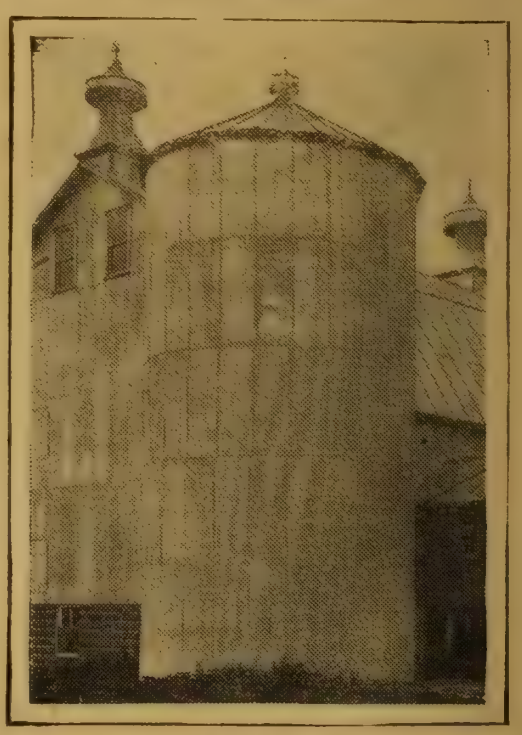
TWIN CLAY BLOCK SILOS.
A permanent character of silo which has been found practical.

SILOS ON BEST FARMS.
As a rule farmers who have good silos also have other good equipment.



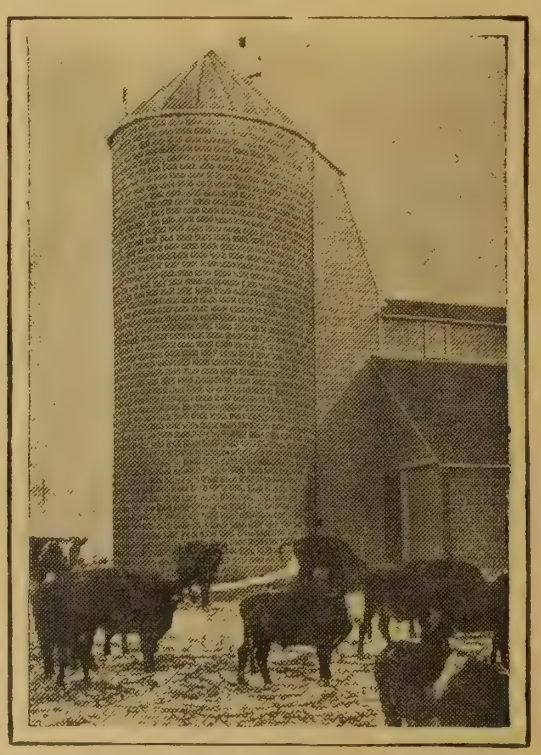
TWO KINDS OF SILOS.
Two well-built silos, one of wood and the other of a clay block type.

THE HOOP SILO.
A Serviceable and practical silo of the wood construction type.



CONCRETE SLAB SILO.
Practical use of cement is made in silo construction.

SURVEYING A GOOD JOB.
This farmer has just completed a good silo and is more than pleased with it.



LARGE BLOCK SILO.
This silo is equipped with extension top, making it bigger than it looks.

THE CONCRETE SILO.
A very substantial type of silo which is coming into general popularity.

BENEFITS OF COW TESTING.

President of Wisconsin Dairymen's Association Reviews Work of Wisconsin's First Cow-Testing Association.

BEFORE the assembled farmers and short course at Madison last week, Math Michels, president of the Wisconsin Dairymen's Association, told interesting cow-testing facts which should be known by every farmer-dairyman of this state. He said that the average farmer has been altogether too slow in applying modern methods to his business. Ten years ago the Wisconsin Dairymen's Association agreed to help dairymen by placing field men to supervise cow-testing work. Mr. Michels, of Fond du Lac county, was one of the very first to take advantage of the offer. He enlisted the aid of R. C. Searls, who is now chief cow-testing supervisor.

From the beginning of this first testing association many new and interesting things have been constantly developing. For instance, there was the one farmer who thought he knew exactly which were his best and which his poorest cows, but who could scarcely believe his own eyes when scales and tester proved to him that he had been sadly mistaken. He found that the cow which had been his pride tested far below his expectations and dried up early. The one which had been considered for the stockyards kept up her relatively small flow of milk for the entire season and two pounds of her milk were worth as much as three pounds from the barn pet.

At another time in the first year's work Mr. Searls was disappointed because one of the largest members had told him he was going to drop the work. By visiting this farmer it was found that he seemed unwilling to disclose the real reason for his decision. However, a little questioning finally drew from him the admission that none of his cows were paying for their board and that he did not want this to become common knowledge in the neighborhood. Mr. Searls tried to persuade him to finish the year's work but of no avail. This cow keeper told him that there was no use because the figures already at hand showed him that none of his cows were going to pay for their board. Next Mr. Searls tried to compare his business with that of a hotel owner who had twenty boarders, some of which were not going to pay their bills. Now he said, "Don't you think that the sooner he finds his bad paying men and gets rid of them the better it will be for his business?" The answer was, "Yes, but I will not sell any of my cows."

Other men of this first cow-testing association only a few weeks ago sold another car load lot of grade cows and heifers at fancy prices. This car was shipped into the state of Kansas.

Another member of this first cow-testing association, while his average production was good, had one cow that did exceptionally well, yielding over 500 pounds of fat for one year. This made his herd famous throughout this section, and any stock he may have to spare, even to grade bull calves, brings him a fancy price.

As much depends upon the feeder as does upon the feeds that are fed. Some may feed expensive rations with no better results than others obtain from much less expensive rations. In other words, the feeder and caretaker may mean as much as one-half the feed fed. Of course, first of all importance is a good foundation upon which to build your herd. This foundation laid, together with continued good judgment in selecting herd sires, it is comparatively easy to raise a well paying herd.

The results obtained from this work of testing cows, go much farther, have much more meaning and point out the way for more profitable and better dairying than is realized at the end of a few years' testing. It leads to higher and better ideals as is plainly shown today throughout Fond du Lac county, where the first cow testing was started. It leads to culling out cow boarders; it leads to the introduction of pure-bred sires; it leads to better care and more economical or better feeding. In fact, it gives the dairy farmer a solid, substantial foundation upon which to build his business. The result has been not alone the increased profits from the herds. Among the indirect results may be mentioned the impetus given to silo building, the general improvement of dairy barns, the introduction of new equipment, making not only for the comfort and convenience of the dairyman and his help, but also adding to the comfort and health of all his stock.

The lessons learned from this association work are of more value and felt even more today than ever before, continually leading the way to better producing herds; teaching the dairymen to become better judges in selecting, breeding and caring for dairy stock. It has been a leading factor in arousing interest in dairy experiments conducted by agricultural colleges and dairy literature in general. In fact, it has led directly in a number of cases to semi-official testing with records as high as 600 to 700 pounds of butter fat.

In just the same proportion as the dairy knowledge has been increasing has there been an increase in production of butter fat, in uniformity of herds, trueness to breed and better care of the cattle and the milk and cream produced. Besides the direct money received for the butter fat (which in a number of instances is running better than $100 per cow), there is an increase in the sale and price of live stock from year to year. As soon as a community gets a cow-testing association under way just so soon will it attract buyers of dairy stock from various parts of the country. A community with a cow testing association has the further advantage of co-operating in disposing of its cream and milk and by co-operative buying of feed. The dairy farmer will soon learn what feed he wants for best results and learn what and how to grow and put up such feeds as are wanted.

Mr. Michels spoke a few words regarding the methods employed in tabulating out the monthly results. The one-day test while there may be slight variations in individual cows, as a herd proves to run very close to the actual yield of butter fat produced for a month. He remembers when one month a creamery patron came with a statement showing that his average test at the creamery had been 4.1 per cent and that of all of his cows 3.9 per cent. Figuring on the total butter fat in each case he found a difference of only 2 per cent; on another patron whose test at the creamery had been 4.0 per cent and his cows all tested 4.0 and better showed by summing up the totals that at the creamery he received 264 pounds of fat and those made by the tester figured up 268 pounds fat. This was near enough for all practical purposes

To be pastor of a church, to successfully manage a farm or a creamery or take charge of a cow-testing association are by no means easy tasks. Each has its troubles and its tribulations. The tester who keeps himself informed, works with zeal and is practical in applying his knowledge, has a chance to do as much good as men in any other vocation. In his work the tester is called upon to advise in many things besides just merely the weighing and testing of milk. He is looked upon for advice as to the care of stock, feeds and feeding, health of stock, growing and caring for crops and in the building and rearranging of barns. No matter how much knowledge may be stored up in a man engaged in this work he will soon find the chance to exercise to his full capacity.

Mr. Michels believes that every cow-testing community should and will sooner or later join the State Farm Management Contest.

INTERESTING BEEF AND MILK RECORDS.

At the world's three leading beef cattle shows held in 1915, where all breeds, grades and cross-breds competed, viz., Smithfield, London, Palermo, Buenos Aires and Portland, Oregon, the grand championships were won by Short-horn steers. At the Western Live Stock Show held at Denver, Colorado, in 1916, the grand champion carload of fat steers were two-year-old Short-horns. A most interesting fact in connection with the above record of beef winnings is the Short-horn dairy record as revealed by the British Dairy Short-horn Society which placed twenty-eight Short-horn cows on the honor roll as a result of the 1915 tests. The yields ranging from 10,006 pounds of milk produced in 256 days to 13,000 pounds produced in 365 days.

These remarkable records are the more impressive because they represent the dual sources of productiveness, a combination long recognized as reaching a high value in the Short-horn.

AN AYRSHIRE COW WINS.

The Rock County Cow-Testing Association, recently organized, now can boast of eight cows which have made records of forty pounds of butter fat within a single month. An Ayrshire cow, owned by W. D. Austin, has the highest butter fat record, having given 918 pounds of milk for the month, with a 6 per cent test and fifty-five pounds of butter fat. The December report of this association shows the following leaders:

Owner, name and breed	Age	When fresh	Pounds milk	Per cent fat	Pounds B. fat
H. H. Little Lady Mayflower No. 22, S. H.	8	11-6-15	1239	3.7	45.8
Janesville Pose No. 55, S. H.	6	11-23-15	1225	4.0	49.0
Lily Clay 4th, S. H.	7	10-5-15	987	4.8	47.3
W. D. Austin Corina Pender 2d, Ayrshire	5	11-22-15	918	6.0	55.0
E. P. Coon Blossom, G. H.	6	10-18-15	955	4.2	40.1
Lauer Bros. Bessie, G. H..	4	11-5-15	1230	3.4	41.8
Ralph Marquart Davy, G. S.H.	13	10-4-15	1071	4.6	49.2
J. B. Palmer Madge, G. D..	7	12-2-15	1314	3.4	44.6

H. M. Burdick, Secretary.

It costs less to buy a

DE LAVAL

than to buy experience

EACH year some 40,000 farmers, who have bought at one time or another "cheap" cream separators, discard their inferior, cream wasting machines and replace them with clean skimming De Lavals.

These men bought the "cheap" machines because they thought they were "good enough" or "just as good" and that by purchasing such machines they could save a little money. They actually would have been better off in most cases had they bought no separator; for they lost most of the money they spent for the "cheap" machines, besides all the cream these machines have failed to get out of the milk.

No one ever saved money using a "cheap" cream wasting separator or an old or half worn-out machine. No one ever got back the money spent for such a machine by continuing to use it. Those who bought "cheap" machines and got out of the difficulty best are the ones who quickly discovered their mistake, discarded the inferior machines and put in real cream separators—De Lavals.

There are nearly 2,000,000 farmers who have bought De Lavals, and every one of these had just as many opportunities to buy "cheap" separators as any one else. They did not do it and are now money ahead. They have avoided paying the high cost of experience, and their De Lavals have paid for themselves many times over. It always pays to buy a separator of proved, known superiority.

The nearest De Laval agent will be glad to let you see and try a De Laval on your own farm, without obligating you in any way. It is better to take advantage of this opportunity than to pay dearly for your own cream separator experience. If you don't know the local De Laval agent, simply address the nearest main office as given below.

The De Laval Separator Co.

WISCONSIN FARMER FUTURITY CUP

For the past two years The Wisconsin Farmer has offered a silver loving cup as a trophy for the winner of the Poland China Futurity at the Wisconsin State Fair. The illustration shown herewith presents a picture of the cup which was won at the 1915 Wisconsin State Fair by J. D. McDonald, Poland China breeder, of North Bend, Wisconsin. The Wisconsin Farmer in offering this cup each year is trying to do its part in encouraging better live stock. Mr. M. Madson, of Dane county, won the cup the first year. A similar cup will be offered for the 1916

(Concluded on page 27.)

FARMERS REVIEW PROGRESS.

(Continued from page 14.)

Bought pure seed for members.
Bought folding chairs for the schoolhouse.
Raised $250 by socials and parties.
Arranged for weekly moving picture show.
Gave farmers' picnic and field days.
Organized a men's chorus.
Gave club and township agricultural fair.
Arranged for lecture course.
Put on local talent plays and concerts.
Co-operative buying.
Arranged for farmers' institute.
Helped the county to get agricultural representative.
Helped to exterminate grasshoppers.
Arranged for better farming automobile tours.
Got out a club cook book.
Arranged plowing contest.
Arranged tractor demonstration.
Organized poultry club for young people.
Organized girls' sewing classes.
Arranged for exchange table and bulletin board.
Organized county country life conference.
Secured appropriation from school district for community work.
Increased use of state and national publications.
Organized central electric lighting plant for small village.
Assisted movement for new town hall.
Arranged for union graduation exercises of rural schools.

W. D. Frost, of Madison, and Ernest W. Warner assisted in directing the conference and round table discussions. Mr. Warner has been president of the conference for two years. He is an attorney and became interested in this work through the rural school at Mendota Beach, Dane county, where many modern ideas of rural education have been worked out.

It would not be possible to tell of all the interesting sessions of the home department under the general direction of Miss A. L. Marlatt, of the home economics department of the university. There were sewing and cooking demonstrations and discussions of home furnishings and equipment. The proper arrangement of kitchen furniture to save labor, modern power machines to do the washing, the use of electricity in the farm home and kitchen and other topics just as interesting were brought up.

Miss Elizabeth Kelley, well known throughout the state because of her extension work, dwelt upon the importance of better living and the relationship between the home and the farm. The old idea that the home on the farm is the last thing to consider and that the home environment of the wife and children is a matter that can wait, Miss Kelley said, is all wrong. The quicker the farmer realizes this fact the sooner he will understand why children want to leave the farm. Contented mothers and children, made possible by good homes, she said, should mean more to the farmer than his live stock and his crops. Miss Kelley deplored the situation where the farmer and his wife have labored hard for years to accumulate a competency to the neglect of their children. Although it is well to be thrifty and frugal and always put away something for the rainy day, she believes it a better policy to see that the children get the proper attention. Spend some of the savings for better homes, better equipment and for those things which make home a real home. In these days when bathrooms, electric lights, furnaces, etc., can be secured by the farmer at reasonable cost Miss Kelley believes that to secure these conveniences should be the ambition of every farmer as well as to secure better barns and better farm equipment.

The most interesting and largest meeting ever held by the Wisconsin Alfalfa Order was the annual meeting held last week at Madison. Many important business matters were considered and the old officers were reelected for another year, they being James B. Cheeseman, of Racine, president; Ex-Gov. W. D. Hoard, of Fort Atkinson, vice president, and L. F. Graber, of Madison, secretary and treasurer. Several splendid addresses on alfalfa were also given and the alfalfa motion pictures, showing the preparation of the seed bed, soiling, harrowing, seeding and harvesting proved very popular as well as instructive.

One of the interesting papers of the convention was the annual report of Mr. Graber, who outlined the experiences of members of the order last year with seed distributed by the order. Mr. Graber compiled this report from the answers from about 500 alfalfa growers. In three years the order has grown so that it now has 1,350 members and Mr. Graber pointed out that the order stands for the encouragement of alfalfa growing in Wisconsin, but it would rather not have anyone attempt to grow alfalfa if he is not prepared to give it a square deal. The greatest drawbacks to the extension of alfalfa growing in Wisconsin today are the failures of those who take a "chance" of getting a catch of alfalfa by seeding it any old way without regard to the requirements of the crop. As a result it was interesting to hear what 487 farmers who started alfalfa last year reported to Mr. Graber:

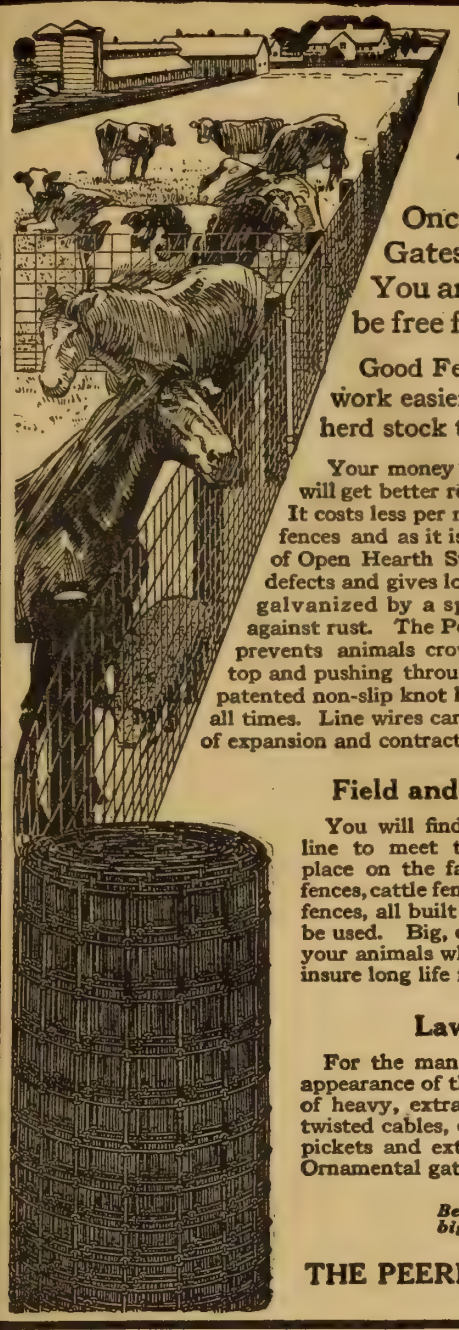
To date 487 reports have been received. The following shows the percentages of successes and failures throughout the state on this comprehensive test.

ALFALFA SEED DISTRIBUTED SPRING OF 1914.

Per cent of growers having good success	59
Per cent of growers having fair success	22
Total	81
Per cent of growers securing poor stands	7
Per cent of growers reporting failures	12
Total	19

Why 12 per cent failures and 7 per

(Concluded on page 45.)



Stretch a PEERLESS FENCE

Around Your Farm And Quit Worrying

Once your fields are all enclosed with Peerless Fencing and Gates, your fence troubles are over for a long time to come. You are sure to find your animals where you want them and will be free from injuries caused by trying to get through a poor fence.

Good Fences and handy Gates increase the value of your farm, make the work easier and your assistants more contented. The hired man hates to herd stock that has broken out and mend old inefficient fences.

Your money will go farther and you will get better results with Peerless fence. It costs less per rod than other high grade fences and as it is made of the best grade of Open Hearth Steel Wire it is free from defects and gives long service. It is heavily galvanized by a special process insuring against rust. The Peerless one-piece crossbar prevents animals crowding it down from the top and pushing through at the bottom. The patented non-slip knot holds the wire in place at all times. Line wires carefully coiled to take care of expansion and contraction.

Field and Poultry Fences

You will find a style in the Peerless line to meet the requirements of any place on the farm. Hog fences, sheep fences, cattle fences, paddock and poultry fences, all built for the place they are to be used. Big, closely spaced wires keep your animals where you want them and insure long life for the fence.

Lawn Fences

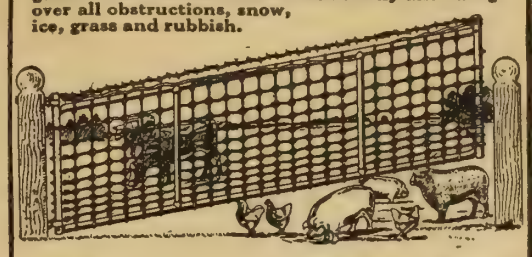
For the man who takes pride in the appearance of the front yard. All made of heavy, extra galvanized wire, extra twisted cables, extra deep crimps in the pickets and extra care in construction. Ornamental gates to match the fence.

Peerless Gates

Very few farmers can afford board gates in this age of high price of timber. Peerless steel gates are not only cheaper but they look better and are easier to handle. Heavy tubing frames, filled with special galvanized wire, insures long life. Every part of every Peerless gate is heavily galvanized to prevent rust.

The Peerless Self-Raising Gate

IS one of the best selling styles in our entire line. It is no longer necessary to lug around the old-fashioned sagging, dragging, heavy gates. The Peerless lifts automatically and swings over all obstructions, snow, ice, grass and rubbish.



In addition to being self-raising, it is extra heavy in both frame and filling. Big massive frames of 1⅝" tubing and close woven all No. 9 wire, close mesh filling, insures long life.

Every part heavily electro-galvanized—no paint to wash or wear off in a year or two.

Before you buy a rod of fence or a single gate you should send for our big free catalogue and get full details about Peerless fencing and gates

COST OF SPRAYS.

Orchardists in attendance at the Farm and Home course at Madison who heard R. H. Roberts, of the experiment station, on "Orchard Spraying" were given a splendid insight into the cost of such spraying as well as its value.

Mr. Roberts said that experiments have proved that the cost of spraying is about 1 cent for each year of the age of the tree. For example, it would cost 10 cents to spray a tree ten years old; 15 cents for one fifteen years old, etc. Of course, these prices might vary, but this was estimated to be about the average cost per tree per year. The larger the yield the lower the cost per bushel, and other experiments he said showed that in 1915 it cost on the experimental plots about 4 to 7 cents per bushel of fruit produced for spraying.

As the farmers and orchardists who sprayed received much more for their product than the orchardist who did not spray the cost of the operation was entirely justified. Sprayed trees on the orchards under investigation produced apples that brought from $1 to $1.50 per bushel while those unsprayed produced fruit that sold for 50 to 75 cents.

Mr. Wilson dwelt at length on the insects and diseases confronting the orchard owner and pointed out which sprays were needed to overcome these difficulties. He also explained the mixing of sprays and said that there were no Wisconsin apples on the local markets at this season because of lack of spraying, the stock not possessing of keeping qualities that are needed to carry the fruit through until the spring.

The following he suggested as a proper apple spraying program which could be followed at reasonable expense and to the benefit of the orchardists in Wisconsin:

APPLES.

1. Dormant Sprays.
   Scale.—Use commercial lime sulphur, one gallon to ten gallons of water before growth starts.
   Aphis.—Use nicotine sulphate (Black Leaf 40) one pint to 100 gallons of water when buds first show green. Add three pounds soap to each 100 gallons.
   Note.—When both scale and aphis are present, delay the scale spray and add the nicotine to the lime sulphur without soap.
2. Growing Season Sprays.
   A. "Pink" Spray for Scab and Curculio. Use 4-4-50 Bordeaux or lime sulphur, five quarts to fifty gallons in combination with arsenate of lead, three pounds (paste) to fifty gallons or one and one-half pounds (powder) to fifty gallons when the flowers first separate in the clusters.
   B. "Calyx" or First Moth Spray for Scab and Codling Moth.—Use lime sulphur and arsenate as in A when petals fall, and before calyx cups close, three to seven days.
   C. Second Moth Spray.—Lime sulphur and arsenate applied from ten days to two weeks later than B.
   D. Summer Spray.—Use Bordeaux, 4-4-50 and arsenate about July 20th to 25th, about a week after second brood codling moth eggs appear.
   Note.—Avoid using Bordeaux during wet, rainy weather as this condition favors Bordeaux injury to fruit and foliage. Do not use lime-sulphur during dry summer weather when temperatures are high. Also do not mix Bordeaux and Black Leaf.

CHERRIES.

1. Farm Orchard.
   Spray cherries when spraying apples.
2. Commercial Orchard.
   Bordeaux is used on cherries when spraying for Shot Hole fungus.
   Usual practice is as follows:
   1. Bordeaux and arsenate just before blossoms open.
   2. Same as above when calyx (shuck) falls.
   3. Two to three weeks later.
   4. As soon as possible after fruit is picked.

PLUMS.

Spray when spraying apples, also three to four weeks before fruit ripens.

GRAFTING WAX FOR TOPWORKING.

A friend wants to know how to make a good grafting wax which is just right for outdoor work in either warm or cold weather.

Here is a receipt in general use and always recommended: Rosin, four parts; beeswax, two parts; tallow, one part. You may make a large quantity or a small quantity, just as you wish, but be exact, weigh out the materials.

First, put the rosin in the dish and let it melt, then add the beeswax and tallow. While the melting proceeds stir thoroughly that all may be well mixed. If you have a good, hot fire it will be well done fifteen minutes after adding the last ingredients.

Have a pan ready with some cold water and turn into it enough of the mixture to make a good handful. Grease your hands while it is cooling and in a minute (you must not leave it to get too hard) take out of water and pull—just as though it were taffy. It will turn to a beautiful yellow, but don't eat it if it does look good. Make it into sticks four inches long and one inch thick.

Proceed with the rest in the same way, cooling each time as much as you can pull handily until it is all "sticked."

Of course, the sticks should be put away in some cool place. This wax when used will not crack by cold; neither will it melt and run when the sun shines warm.

If you use it in very cold weather you will have to manage to keep the sticks warm so that it will spread. No better way than to keep it in a pan of moderately warm water.

And, on the other hand, if you use it on a very warm day do the other thing—keep it in cool water.

THE POMONA CURRANT.

Now and then we find some new thing which makes good and fully justifiies its introduction and from observation and experience we conclude that the Pomona currant belongs in the select list of fit survivors. Tested alongside a half dozen leading varieties we give it the blue ribbon.

What the public demands in a currant is not only size and quality but vigor of bush also. The Fay and the old Cherry currant are both first class in many respects, but when it comes to making vigorous, strong bushes they fail. And really what is the use of size and quality in a variety if you never can get a bush big enough to bear a crop? Right here the Pomona comes in strong, for it is as vigorous as the old red Dutch or the Victoria.

The Pomona is a red variety and when grown with half a chance it gives long, full clusters with individual berries as large as the largest. We have often been impressed with the big fruit of the Cherry, but the Pomona equals it.

One advantage of the Pomona is the rapidity with which it may be propagated. A good, strong root planted in rich soil will at once throw up many sprouts, and, as every gardener knows, if you can only get sprouts you can multiply a variety indefinitely. It may be called an early sort from the fact that it ripens its wood and drops its

DEPENDABLE SEED CORN FOR WISCONSIN

OPATA PLUM:—New Hansen plum, ripens July 15th. Bears heavy next year after planting. Hardiest of all

PINE TREE NURSERY PEMAQUID, MAINE

Here's the Secret of Good Plowing

Note the long, sweeping lines on this Janesville plow bottom. Note how the long point runs back and out almost to the extreme to get an easy slicing cut under the furrow. And how the moldboard turns over in a long, flowing curve which curls the furrow as neatly as if molded with a trowel. The shape of the plow is long and narrow. It follows the lines of least resistance from the share point to the heel of the moldboard. It does not raise the furrow, nor kink the soil. Instead, the furrow flows in a long, auger twist that lightens the pull on the team. The moldboard buries all the trash and scours clean as a plate all around the field.

JANESVILLE PLOWS

Manufacturers of Farm Implements

With S. & S. Auger Twist Moldboards

This is the plow that won the championship at the big plowing matches year after year. It turned over the neatest looking fields—buried all the trash and stubble—left the depth and width of the furrows uniform—broke up the ground thoroughly. The excellent work that Janesville plows did in these fields shows the kind of work they can do in yours.

Make One Plow Do All Your Plowing

This Janesville S. & S. bottom will turn any soil you farm—sod, corn land, sticky loam or heavy clay. It takes the place of a sod breaker—it's just what you need as you rotate your crops year after year—you can make one bottom do all your plowing in any field with least work for yourself and the team.

This bottom also works perfectly on tractor plows. Leaves the furrow uniform whether going one mile an hour or four. We can supply Janesville S. & S. bottoms in gangs of 2 and 3 plows for tractor plowing. Two or three bottoms in gang plows—also in single bottom walking and riding plows

A. A. BERRY SEED CO., BOX 934 CLARINDA, IOWA

leaves much earlier than red Dutch

We would certainly drop all the old sorts and plant chiefly of the Pomona. We do not claim to have tested all the newly introduced varieties and it may be, as claimed, that some of them are vastly superior. But we shall prefer to wait before believing it, and, posing as a man from Missouri, ask "to be shown."

THE COTTONTAIL NUISANCE.

Nuisance is the word which best describes the rabbit. In summer he is a pleasant and lively feature of the landscape, and in winter he is an occasionally welcome addition to the bill of fare, but, as a rule, he is a nuisance the year around. He breeds so abundantly that all the efforts of his many enemies can scarcely keep his numbers within bounds.

The danger from the cottontails comes from the fact that they are vegetable eaters, depending upon succulent foods like clover, alfalfa, apples, cabbage, etc. Then when snow comes and these favorites are hidden, as a substitute menu apple bark is acceptable. Big trees are in no danger, for he can only use the small twigs and branches. The bark for him must be tender, and the strength of his mouth will never permit him to gnaw trees over two inches in diameter.

Where it is desired to protect young orchards, a fence of chicken wire thirty inches high will do it, provided the bottom of the wire is set four inches in the earth so that the game cannot dig under it. Where only a few trees are to be protected cylinders of common window screen placed about trees will do it. The cylinder should be so fastened that the rabbits cannot push it up. There are a dozen other methods of protection, like wood veneer, cornstalks, newspapers, etc.

One common way of handling bunny is to set the boy and the shotgun after him. Then there are various ways of trapping and poisoning. The figure 4 trap baited with corn is a very sure way of taking one at a time. But this works best if the trap is placed near a pile of fresh apple brush. The limbs bring the rabbits together to gnaw fresh bark and to get the shelter of the pile, and the chances to get a fresh ear of corn to nibble makes a temptation they cannot resist.

A very successful trap used in Oklahoma is made as follows: Get a 6x12-inch sewer tile tee and set the long end downward so deep that the six-inch opening at the side is below the surface. Then take a length or two of six-inch tile and attach them horizontally with the side opening. Cover the joints with paper or soil to keep out all light. Provide a heavy but easily removable cover for the top of the long tile. Let the end which opens on the surface be protected with brush or stones so as to make the entrance look natural and inviting to bunny. He will at once adopt it as a wise provision of nature for his safety and make it his den and refuge in time of danger. Your dog will know when the game is at home, and while he is smelling at the door and stands ready to nab bunny as he tries to escape, you have only to lift the cover off the standing tile, reach in your hand and pull Mr. Rabbit out. Even if you do not care to catch the game alive, but only wish to kill them as fast as possible, make these traps and place poison inside them where it will be out of reach of birds and domestic animals.

In some states the laws forbid the use of poison, but if you are free to use it, poisoned oats will kill many of them. Mix an ounce of powdered strychnine, an ounce of baking soda, three tablespoonfuls of flour and a small amount of sugar. Put in enough cold water to make a creamy paste, and apply this paste to twelve quarts of good, clean oats. Drop this along the trails or where you know they are often found. You should use this with care, remembering that it will be fatal to birds or stock if they get it.

In a snowy winter, such as this is proving to be, it will save much damage to give prompt attention to the rabbit nuisance.

WISCONSIN FARMER FUTURITY CUP.

(Continued from page 24.)

futurity. Mr. McDonald has animals of good type, large and of a good quality. He has exhibited at the Minnesota State Fair, the Northwestern Wisconsin State Fair at Chippewa Falls, Interstate Fair at La Crosse, and at a number of the county fairs in Wisconsin. In 1914 he won over one-fourth of the prize money in the Poland China classes at the Wisconsin State Fair, and in 1916 he won $566 out of a total of $1,586 offered in the same class. Mr. McDonald has a herd of about 200.

Protection Value of Evergreen Windbreak.

THE evergreen windbreak must not be considered merely as a farm ornament. While it is the most ornamental thing which can be added to a good farm property, and has the advantage of remaining ornamental the year around, its greatest value is its protection. Stockmen who have been without a good evergreen windbreak and then gotten one, are surprised at the difference it makes in stock in bad winter weather. We have known many instances where stockmen have put in evergreens to protect from the north and west and have been so pleased that later they have put in another, simply to protect from the few days of chill south winds which we get sometimes in the winter. The south wind doesn't come often, but it carries a damp chill which is very depressing to stock. The food which is fed to stock in winter gives animal heat which helps the stock to winter through. A good feeding shed, of course, helps and a well-grown windbreak will make such a change in the comfort and growth of stock in the worst winter weather that the stock and the owner will be surprised. We have known several farmers who have sold their properties for a considerable advance just because they had a good windbreak. One banker in Iowa builds windbreaks first on his farm land and puts in his building equipment afterwards. He states that he always adds $2,000 to the selling price of every quarter section, where the buildings are properly protected by a good windbreak. Earl Ferris, 265 Bridge St., Hampton, Iowa, is an evergreen specialist with something like 2,000,000 evergreen trees on hand in his own nursery. He has superintended the transplanting and root-pruning of these evergreens and supplies only trees with good roots and stocky trunks. These trees will grow, and they will grow uniformly and make a nice, even row of everygreens. Write him for low prices which he is making now. Please mention this paper in your letter. See page 26.—Adv.

Three Reliable Brands Of Seeds

Dependable Quality And Reasonable Price Are Assured By The High Reputation Of The Firm Name

NORTHRUP, KING & CO.

JIM SAW THE DIFFERENCE

WHEN Jim Hubbard was planning his spring work a few weeks ago, he came to the conclusion that some of his past methods had been wrong. His crops last season were only fair; some of them, in fact, were mighty poor. His nearest neighbor, Fred Baker, had cut extra heavy crops of grain. Fred's hay crop, too, from the lower meadow, was far ahead of Jim's, which lay right next to it. The soil on both farms was equally fertile and Jim considered himself just as good a farmer as Fred. It was no wonder that Jim was puzzled.

A few days later, Fred, on the way to town in his big "Six," stopped at the Hubbard home. The conversation naturally turned to crops.

"Why is it that your crops are so much better than mine?" asked Jim. "Well, I don't know," replied Fred, "unless it's because I'm more particular about the seed I sow than you are. You seem to think that the purchase of seed is a useless expense and use 'most anything you happen to have. I believe good seed is the secret of my success and always buy the best I can get. I have been using Northrup, King's seeds for over twenty years, and father used them before me. Year in and year out, you can absolutely depend upon the quality of all their brands. I'm on my way now to Thompson's store to order my supply.

"They phoned me yesterday that their box of packet seeds was in and some field seeds, too. If they don't have in stock any seeds I select from the catalogue, they will order them for me. By the way, Jim, have you got their seed catalogue? It's a dandy. You ought to send for it. I'd lend you mine, but we can't spare it. Mother and the children are using it now to plan the garden."

"All right, Fred, I'll take your advice and write today. I'm going to plant seeds of those brands you mentioned, too. Seeing is believing, and I know the fine crops they gave you. Thanks for the suggestion."

From Iowa

SOLVING THE HEATING PROBLEM.

To the Editor:—There was a discussion in our neighborhood as to which article of household equipment contributes the most to the comfort of the modern home and all its inmates and the man who argued that it is nothing more nor less than the little radiator in the corner won the debate and took the neighborhood prize for the best talk on a commonplace article.

There are twenty men and twenty women in our club and nearly every single one of them championed a different article, ranging from the parlor piano to the little dollar machine the women use to grind apples and mincemeat. But only one of the bunch thought of the radiator, and he was given the merry laugh at first. They made it unanimous, though, when he got through and the vote was taken on which was the most convincing talk.

I'm not saying that a radiator is the handiest thing a man can have in his house. I'm just telling you what this other man said and if you had been there and heard it it's a cinch that you would have voted just like the rest of us thirty-nine people did. And really, it's wonderful, when you come to think of it, what a lot of domestic comfort there is in these radiators and what goes with them.

He told about the time when he was a boy and it seemed as though the whole burden of living was bound up in the job of eternally cutting wood and building fires and keeping them going. That made a hit with me and I guess most of the rest of the bunch were up against the wood fire stunt when they were small, the way they appreciated what he said. We had a stove in the kitchen, another in the dining room, another in the parlor, a big fireplace in the downstairs bedroom and three bedroom stoves upstairs. We didn't keep them all going all the time, but they were all going some of the time and some of them all the time. In cold weather it was a case of fix the fire, fix the fire, fix the fire, until I used to secretly curse the man who discovered fire. And every stove had to be continually tended, not only to keep the fire going but to keep it clean. And when it was warm and we didn't need fires we had to cut wood for the next winter and pile it up in the big woodshed. And then every spring we had to take down all the stoves and store them away in the barn and every fall we had to get them out again and clean them up and black them and set them up in their places. Altogether, looking back on it now, a stove looms up as veriest bane of my early existence and that of my father and mother and brothers as well.

Now look how the thing is done. Down in our basement there is a boiler not much bigger than our old round, sheet iron parlor stove. In the morning I shake it down a bit and put in a few shovels of coal and in the evening the same. Once or twice a year a boy carries out the ashes and that is all there is to it from one year's end to another. The little regulator on the boiler automatically opens the door when the heat goes below a certain point and it closes it again when it begins to get too warm. From the time we start the fire in the fall until we let it go out in the spring the whole of the house is maintained at the even temperature we desire, say 75 degrees, no matter how cold or how warm the day may be outdoors. We pay a very moderate coal bill. The boiler downstairs and the little radiator in the corner do the rest.

The modern heating companies have simply brought steam and water heating to perfection, for all kinds of homes, no matter how small. The radiators take up so little room as to be no consequence. The new designs are an ornament to a room, rather than otherwise. They do not generate constant dirt like a stove and they do not spout dust like the registers of a hot-air furnace. They can be painted or gilded every year to match the furniture or wall paper and they are always doing business with the least possible attention. My wife never worries lest the fire go out and the children take cold. The house is always the same, no matter what time of the day or night, and my boys are not being brought up to dread the very name of fire. When you come to think about it it isn't so much of a wonder that the man who picked the radiator as the greatest home comfort won the prize unanimously.

Subscriber.

Wireless is the latest fad for two New England girls. In their own laboratory on Cape Ann they spend every evening over their wireless plant and learn all the news which the public will read of in the morning newspapers. Miss Margaret L. Campbell and Miss Gertrude E. Tarr, both popular young women of Rockport, are the owners of the wireless plant. Last May they became interested in this work and decided to attend school in Boston, where they finished the course. Then they built the laboratory on the property of Miss Campbell's father. Each evening at 10:15 they get news from all the world and receive some messages from Arlington. Many of the messages they overhear are in cipher.

Department of Agriculture chemists are examining samples of new foods from animal bone and blood invented since war began by a German scientist at Cologne. Bozivan is the name given to the blood food. The German ministry of trade and industry is investigating the scientist's claims that he has developed nourishing foods. Samples of the foods were sent to the United States by an American consul in Germany.

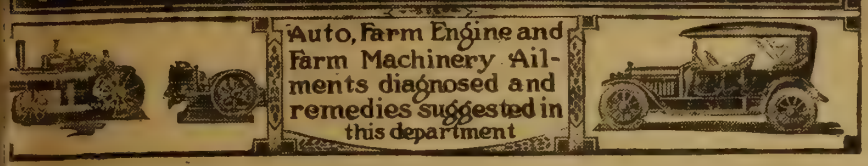
FARM MECHANICS



QUESTIONS AND ANSWERS.

Wiring a Tail Light.

I would like to put an electric tail light on a 1915 Ford car. If possible I would like to operate it by the same switch as the headlights. Please tell me how to wire it.

Answer.—Connect the tail light wire to the switch terminal to which the headlight wire is connected. Run the tail light wire from this terminal to the tail light. From the other tail light terminal run a ground wire to the frame. Use a sixteen-volt, two-candle-power light.

A Peculiar Circumstance.

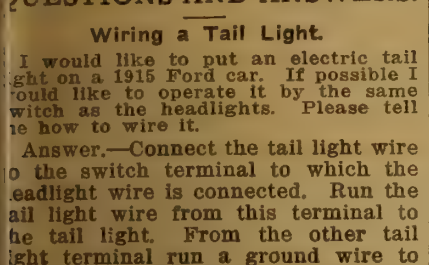
Please tell me what causes my Reo 1914 car to misfire at a certain place in road? The road is level and smooth. The engine will be running fine until it gets to that place, when it will make a noise like it was firing twice instead of once and then misfire. Is there some material in the ground that causes it to do so?

Answer.—We have heard of cars that ran better in the morning than at night, but we never before have heard of a car that objected to traveling over a nice, smooth, level road! Some cars actually run better in the daytime than after dark, as the air is damper and heavier after dark and the carburetor may be so adjusted that the lighter air gives better results. If the level road is on very low or very high ground this may be an explanation of your trouble, the air being heavier on low ground. It may also be that some part of your carburetor has a tendency to stick and that on a level road there is not enough vibration to keep it from sticking.

Electric Light Switches.

Please give me a diagram of a three-point switch with a four-point switch between them. How many lights can be governed by these switches? We have a 110-volt system. What size fuze plugs should we use?

Answer.—The figure is a diagram of



this combination. A, B and C are the points of one of the three-way switches. D, E, F are the points of the other three-way switch. G, H, I, are the points of four-way switch. At one end the switch lever, S, connects A with either B or C. At the other end the switch lever, I, connects E with either D or F. In the four-way switch the bars XX connect G and I, also H and J, when in the position shown. When turned a quarter way around they connect G with H and I with J.

Any number of lights may be connected as shown and controlled by any one of the three switches regardless of the position of the other two switches. For instance, with these three switches located respectively down stairs, up stairs and in the basement the hall light could be turned on or off at any one of the three switches. Or these three switches could be wired to control all the lights of any branch line from any three desired points in the house. Of course, the lights could not be controlled independently of each other by the switches.

The fuse plug that should be used depends upon the amperage, not the voltage. Fuse plugs from six to ten amperes capacity are usually used on house lighting systems. A ten-ampere fuse is usually considered safe for No. 14 wire.

Engine Too Small for Tractor.

I enclose a drawing of a plan I am going to use in making a small tractor. I have a two-horse-power gas engine that I wish to use on a small tractor so that it will pull itself. We have to take it quite a distance to pump water. It would be handier to have it pull itself. How large a load would it pull? Would it be best to use a belt drive? How could it be steered? What kind of front wheels and axle would you advise me to use? Would it pull a walking plow? Would it pull a cultivator? How fast would it go if the engine makes 850 R. P. M.

Answer.—Your machine would not much more than pull itself unless you use ball-bearing wheels, so as to do away with as much friction as possible. At any rate, it would be too small for plowing. We would suggest that you use motorcycle wheels, two behind and one in front. Steer with the front wheel, using handle bars like a motorcycle. Also use a motorcycle chain drive and coaster brake. Gear it to about two miles per hour. Space will not permit us to publish a sketch.

A Magneto for Ignition.

We have a seven-horse-power engine that we have been running on dry cells. We are thinking of putting on a magneto. I presume we will have to start on the dry batteries. Can we use the same spark coil for both? Will there be any danger of the electricity running down into the batteries if we use the same coil? Is there any danger of short circuiting the magneto if we use too much oil? Is a friction drive better than a belt drive? Which will give the better results, battery or magneto?

Answer.—You can use the same coil. Use a double throw switch, so that when the switch is in one position the batteries are connected to the coil; in the other position the magneto is connected to the coil. Start on battery and as soon as the engine gains speed switch to magneto. With the switch arranged as above there will be no possibility of the magneto current affecting the battery. Do not use more oil than necessary on the magneto bearings, as too much oil might cause a short circuit. Friction and belt drives are equally satisfactory if properly constructed. Use the drive that is easiest to install on your engine. As a rule, a magneto gives better satisfaction than a battery and costs very little to keep up.

Electricity and Horse Power.

How many horse power is required to run a dynamo, relative to its output? How much electricity is consumed in heating a gallon of water to the boiling point?

Answer.—Watts equals volts times amperes. One horse power equals 746 watts. A 110-volt generator delivering seven amperes is delivering a little more than one horse power. Small generators are only 70 per cent efficient as a rule. Therefore, a generator delivering one horse power would require about one and one-half horse power to run it. It requires about two and one-half watt hours to raise the temperature of one gallon of water 1 degree Fahrenheit.

A Dry Cell Battery.

I would like to know how to make a dry cell battery to test about forty amperes.

Answer.—Obtain a zinc cup four inches in diameter and eight inches high. Line the cup with paper about one-sixteenth of an inch thick. The paper should be wet. Obtain a stick of battery carbon about one inch in diameter and eight inches long. Pack the paper-lined zinc cup with manganese-dioxide moistened with a weak solution of salammoniac, placing the carbon stick at the center, allowing the end of the carbon to come within one inch of the bottom of the cup. The manganese should come within one inch of the top of the cup. Fold the paper lining over the top; put in a layer of clean sand and fill the space at the top of the cup with coal tar. Keep the cell in a pasteboard box.

Evidently you wish more current than the ordinary No. 6 cell furnishes. You can obtain forty amperes on test by connecting two ordinary dry cells in the multiple, that is, zinc to zinc. This heavy current will flow only for an instant, however. A No. 6 dry cell will not furnish much over one-half ampere for any great length of time.

Too Much Gasoline.

I am writing to you to find out the the trouble with my gasoline engine. It is a one and one-half horse power "Hummer." It will run four or five revolutions and then stop. The gasoline will then run out of the air damper. Where is the "Hummer" engine made?

Answer.—Evidently you are giving the engine too much gasoline. In order for an engine to run the amount of gasoline must be regulated correctly for the amount of air used. Too much gasoline is as bad as too little. Do not unscrew the needle valve so far. We do not know where the above engine is made.

Galvanizing.

How can I galvanize a small piece of iron?

Answer.—Clean the iron so that it is free from rust, scale or grease. This is usually done by pickling in dilute muriatic acid or polishing with emery cloth. Then dip the iron in molten zinc.

What Our Big Production Means to You

Year after year for many years, we have made more spark plugs than all the others *combined.*

Year after year we have greatly enlarged our output.

This year we will double last year's production.

Year after year we have made Champions more and more dependable.

As our production has grown we have been able to adopt extreme and still more extreme measures to insure dependability—

Because—as our production increases we can distribute the expense of these extremes of engineering, of testing and of processing over a vastly larger number of spark plugs.

That's why Champions are so much more dependable.

Your dealer will supply you with the Champion designed to serve your car more dependably than any other. Look *on the porcelain* [not merely on the box] for the name *Champion.*

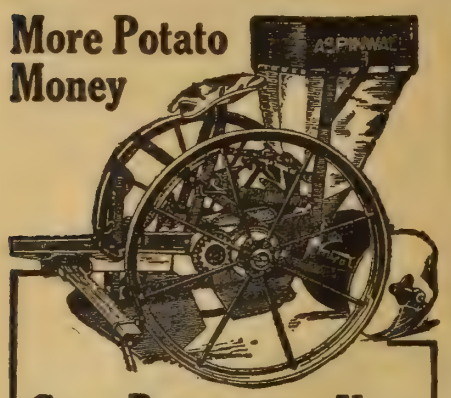
More Potato Money



Grow Potatoes this Year

PUT in a big acreage. Make more out of potatoes than out of grain—200 bushels to the acre is not uncommon. An Aspinwall one-man planter plants 5 to 8 acres a day. Plants at uniform depth and spacing—uniform planting means biggest yield. Machine opens furrow, drops seed—any size—any distance—covers, marks next row, and if desired, sows fertilizer all in one operation.

Aspinwall Potato Machinery

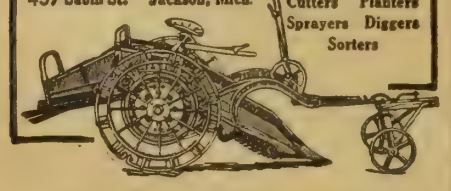
Manufactured by the *World's Oldest and Largest Potato Machinery Makers.* 60,000 Aspinwall Planters in use. Take no chances on unproven machines. Learn all about the

Aspinwall Potato Digger

with Agitating Rear Rack, with or without Vine Separator. Gets all the potatoes clean. **Depth of digging regulated by handy lever. Side Hill Lugs and Wheel Bands furnished free.** Light draft, **bronze bearings.** Made in three styles, meets all soil conditions. Write for free catalog on Potato Machinery and ask questions on potato growing. Write today.

ASPINWALL MFG. CO.
457 Sabin St. Jackson, Mich.

Cutters Planters Sprayers Diggers Sorters



Cheaper Than Wall Paper

Hickory "99" is the finest finish for walls and ceilings that you ever saw. A large variety of beautiful shades and tints—whatever you wish. Dull toned and *washable.* Costs less than wall paper—easier to apply—and it *lasts*—keeps bright and new for years. Suitable in any home.

Comes ready to use—anybody can apply it—no mixing. Easy to brush and doesn't show brush marks.

Hickory "99" Wall Finish

is sold by all Hickory hardware dealers. Use it over any surface—board, plaster, burlap, wall paper or woodwork. No peeling, no flaking. We guarantee every can of Hickory "99." Satisfaction, new goods or money back.

And for the finest, most lasting varnish you ever had, *Use Hickory Floor Finish.* Will not mar or turn white under hardest usage. Hot or cold water positively cannot affect it. Absolutely guaranteed.

FREE Set of handsome poster stamps showing rooms finished with Hickory "99" actual colors. Suggestions for your home. Write today and we will send entire set free.

In And Around Wisconsin.

Creameries Report Satisfactory Year Which Indicates That 1915 Was Favorable For Dairymen—Other Items of Interest to Farmers.

William Hawkins, one of the pioneer creamery men of Wisconsin, died recently at his home at Roberts.

Farmers in the vicinity of Albion, Dane county, recently met and organized a co-operative association for the establishment of a cheese factory.

The dairy and food commission has warned all dealers that "spot" or "bad" eggs are treated as adulterated foods and the sale of such is punishable by a fine of from $15 to $100 or imprisonment. The law affects farmers as well as dealers.

The Baraboo Valley Farmers' Club at its annual meeting recently elected J. O. Lucht president for the coming year; Lawrence Siebecker, vice president; Mrs. John Brown, secretary and treasurer, and Mrs. John Rumph and S. S. Parsons members of the program committee.

The ball has been started rolling in Winnebago county for the employment of a county agricultural representative and at the recent institute at Oshkosh committees were named to confer with the county board in the hope of inducing that body to make the necessary county appropriation.

Green county cheesemakers are teaching Montana farmers the value of cheese factories and during the past few months several have removed from there to various points in Montana. Jacob Marty, of Brodhead, is planning to start three or four brick and Swiss cheese factories there this spring.

Reports by the tanners show that Wisconsin farmers and trappers had a very successful catch of raccoons this winter, the open season for which closed on February 1st. Prices have been good this season and farmers who spent their spare moments trapping were well repaid. The season for trapping skunks also closed on February 1st in Washington and Ozaukee counties. In other counties there is no closed season on skunks.

The dates for the 1916 Fond du Lac County Fair have been set for September 19th-22d, immediately following the state fair at Milwaukee. This plan of staging this fair immediately after the state fair has proven advantageous, as it catches much stock released at Milwaukee the week previous. The county board recently set aside $2,500 for improvements at the grounds and committees are now working on plans for several new barns and buildings.

Kewaunee, the fourth smallest county in the state, claims it has more registered farm names than any other county. Already more than 350 names have been recorded.

The Fox River Valley Holstein Breeders' Association at its recent annual meeting re-elected R. J. Shaefer, of Appleton, as president, and E. Mueler, of Appleton, secretary and treasurer.

C. E. Blodgett, of Marshfield, and P. E. Kampine, of Neillsville, have begun the erection of a modern concrete cheese factory on the Osseo road, Wood county. Mr. Kampine will be in charge of the factory.

The Oconomowoc Poultry and Pet Stock Association has chosen December 6th-10th as the dates for the next show and W. E. Stanfield, of Hillsdale, Mich., will place the awards. C. O. Hudson was elected president; Heyliger DeWindt, first vice president; W. A. Nack, second vice president; F. S. Clausen, treasurer, and George Johnson, secretary.

A woman's building and a new cattle barn will be completed in time for the next Sheboygan County Fair at Plymouth on September 6th-9th. These improvements were planned at the annual meeting recently at which P. K. Wheeler was elected president; Peter Reiss, secretary.

The Barron creamery, which is thought to be the largest co-operative creamery in the world, broke all records in 1915, showing a gain of 17 per cent over the previous year. The butter production for the past year was 1,299,429 pounds, for which the farmers were paid $334,061.32. As the creamery operates only six days a week in the summer and but four days a week in the winter, the average amount paid farmers runs better than $1,200 for each working day and averages over $1,000 a day for each of the 300 working days of the year. The creamery has over 800 patrons and the cream is gathered right from the house doors by twelve cream carriers on eighteen routes. Two of the carriers use automobile trucks with success, which speaks volumes for the good roads of this section and the clay soil which makes possible such good roads. There was gathered the last year 3,986,370 pounds of cream, which made 1,095,550.4 pounds of butter fat, for which was paid an average of a little over 30½ cents per pound. Last month 38 cents was paid.

The Central Wisconsin Cheesemakers, Buttermakers and Dairymen's Association is scheduled to meet at Stratford on February 19th and a large attendance is expected.

The sixteenth annual convention of the Southern Wisconsin Cheesemakers and Dairymen's Association will be held at Monroe, Green county, February 23d and 24th, and preparations have been made to make this the biggest meeting ever held by the association.

It is not unlikely that Wisconsin will be well represented at the first National Swine Show which will be held in Omaha early in October. Already one of the breed associations of this state is planning on sending a combination exhibit and the matter will be presented at the meetings of swine men to be held at the college of agriculture the present week.

Two Wisconsin fairs—those held at Milwaukee and La Crosse—are to be benefited by the special appropriation made by the American Shorthorn Breeders' Association in the aid of American breeders of this class of cattle. Notice of this action has been received by John L. Tormey, of the college of agriculture, who is the secretary of the Wisconsin Short-horn Breeders' Association.

VISITING FARMERS FROM NORTH DAKOTA.

Again this year North Dakota farmers, bankers, county agents and business men, representing a section of North Dakota, came to Wisconsin to get pointers. The group shown herewith was photographed while the party was in Madison. The company represented Benson county, North Dakota. There were several representatives of the Great Northern Railroad in the party. H. J. Boyts, county agricultural agent of Benson county, accompanied the visitors. These men came to Wisconsin to study dairying and to investigate the pure-bred grain situation as it has been developed in this state. They took a great interest in the road school which was held in the capitol building the evening they were in the city.

The West Salem Co-operative Creamery, La Crosse county, had a very successful year and finished the year with a balance of $12,971.92. This is one of the largest creameries in Wisconsin and the following statistics from the report sent us by Mr. J. H. Moran, treasurer and manager, will be of interest to all:

Number of shareholders	388
Number of shares outstanding	6,804
Average number of patrons	383
Pounds of cream received	2,935,339
Pounds of butter fat received	730,986
Pounds of butter made	899,229
Average overrun	.23
Average test of cream	.249
Average cost of gathering 100 lbs. cream	$ .41
Average cost of gathering 100 lbs. butter fat	1.66
Total cost of manufacturing 100 lbs. butter, farm to car, permanent improvements not included	2.93
Monthly average price paid per 100 lbs. butter fat	32.67
Pounds of butter made in 25 years	17,053,925
Paid patrons in 25 years	3,503,944.90
Paid cream haulers in 25 years	183,016.90

Diseases of Our Cattle.

By Dr. David Roberts, of Waukesha, Former Wisconsin Veterinarian, Before Wisconsin Ayrshire Breeders.

OF ALL the live stock diseases known to American cattle there is no one disease that has attracted a wider attention than the foot-and-mouth disease which we have experienced in America during the past year. Those who were unfortunate enough to have their herds come in contact with this disease had reasons enough to be alarmed, and even those whose herds were in the same vicinity had reasons to be alarmed, but unfortunately for the live stock industry this alarm has spread to nearly every part of our country. For this reason our live stock industry has been virtually at a standstill, but owing to the fact that the foot-and-mouth disease has been practically eliminated from the United States, I feel that the live stock breeders have no particular reason to be afraid of any further serious outbreak, and I believe we will settle down into the healthy, normal condition.

The next serious thing along the line of cattle diseases is bovine tuberculosis. But it lies within the power of every live stock owner in America to detect and eradicate tuberculosis from his herd. While the tuberculin test is not infallible, it is the very best method known to detect tuberculosis and it is only in rare cases that it fails. And when it does fail to detect this disease you can rest assured that such an animal is in the last stages of the disease and any ordinary experienced person can determine without doubt that such an animal should not be allowed to remain in the herd whether she reacts to the tuberculin test or not.

When the tuberculin test was first introduced it was looked upon with a great deal of suspicion, and even to this day there are people who look upon it with suspicion, but the experienced live stock owner has implicit faith that he can protect the health of his herd by the use of this test.

The next serious disease that cattle are heir to is contagious abortion, and it is alarming the large per cent of cows and heifers that abort annually. The loss brought about by this disease alone runs into millions of dollars, to say nothing about the loss of milk and usefulness of the cows afflicted.

Some twenty-five years ago I realized that the United States was experiencing a heavy loss on account of abortion and for this reason gave this disease special attention and mapped out a plan of treatment which has been applied during the last quarter of a century to over 5,000 herds of cattle in the United States alone.

This treatment is not infallible, but it is the very best method known to eradicate and control contagious abortion in cattle. It was at first looked upon with suspicion, just as was the tuberculin test and even now there are people who have not had experience with it that might question its reliability, but the mere fact of having been in use all these years and that 5,000 live stock breeders have tried and tested out this method of eradicating contagious abortion and have found it successful (otherwise they would not come back for this same treatment when their herds become reinfected) goes to show that such a treatment has stood the test.

Many times when live stock owners inquire what to do for abortion they are advised by inexperienced people that there is no cure for the disease, or they may recommend various treatments, most of which are found too expensive or too bothersome to be practical and again they may advise allowing the disease to take its course, as cows will become immune in from one to three years. But the heavy losses that the owners experience by losing three crops of calves and by the noticeable shortage in the flow of milk makes the latter plan of getting rid of abortion even more costly.

If abortion is allowed to run its course in a herd (and this requires from one to three years) you will understand that these animals are still diseased. However, they may carry their calves full time. Still, if you introduce a healthy, pregnant cow into such a herd she will become infected and is liable to abort once, twice or three times, and then she, in turn, becomes immune, but is always in a condition to spread the disease.

On the other hand, if the disease of abortion is checked in a herd and the herd is free from the germs you can introduce a healthy, pregnant cow and she will not contract contagious abortion. This is the difference between a herd that has recovered and an immune herd. In other words, no treatment should be considered successful unless it can be applied, even after a portion of the herd has aborted, and check the disease immediately to such an extent that there will be practically no further abortions and the cows that have already aborted conceive again at the proper time and deliver strong, healthy calves at full time.

Barrenness is another serious affliction to a herd and many a valuable animal has gone to the butcher's block without being given an opportunity to breed.

It is perfectly natural for a cow or heifer when in a healthy condition to conceive when bred and if they are bred once, twice or three times and fail to conceive you will know that there is something seriously wrong.

Every barren cow and heifer should be made to breed if possible and a large per cent of them can be made to breed by giving them a tonic to stimulate the genital organs and by washing out these organs with a mild, non-irritating, antiseptic solution. – The mouth of the womb should be dilated, but this should never be attempted excepting when a cow or heifer is in heat and a womb sound and dilator is the most practical method.

In stubborn cases the ovaries of the animal should be examined to ascertain if they are diseased. They are sometimes affected by cysts and these cysts must be ruptured before the animal can be made to breed.

The best advertisement in the world is to keep your herd free from tuberculosis and contagious abortion. This can be done, because it has been done.

When a farmer offers an animal for sale he should guarantee it to be free from tuberculosis, so far as he knows or the tuberculin test can determine, and should also guarantee the animal to be a breeder, whether it be a male or female. But it is not fair to the seller for the buyer to take an animal home and turn it into an untested herd or a herd afflicted with contagious abortion, for the reason that if it contracts tuberculosis the ovaries, being glands, are just as apt to be affected by this disease as any other gland in the body. This will render a cow or heifer barren as well as tubercular.

If a healthy cow or heifer be bred to a sire that has been bred to barren cows there is always some danger of carrying the disease of barrenness to the newly purchased cow. It is for this reason that the seller cannot guarantee his animals further than the day of sale unless precautions are taken by the purchaser to protect the health of the new animal.

When you stop and think that by putting an attractive advertisement in the column of a good, reliable agricultural paper that this paper is the means of introducing you personally to, say 50,000 or more, live stock owners who may be in the market for good cows and heifers, as well as a pure-bred sire to head their herds, you are saving a lot of time and money.

If you were to write a personal letter to 50,000 live stock owners the postage alone would be $1,000 and when you realize that you can put a fair-sized letter in a two to four-inch advertisement and it does not cost you but a few dollars you are accomplishing more than you would by sending a personal letter to these farmers, because the agricultural papers stand back of all you claim and for this reason you cannot afford to misrepresent animals offered for sale.

If you can insert a nice cut of an animal that you are offering for sale it will give the buyer a splendid idea as to whether this animal will suit him or not. Give the name and registry number of the animal, the date of birth, milk and butter records, if any, and the name and number of the sire and dam and their records. This will give the purchaser the information he needs to determine what family of pure-bred stock they are from. If you tuberculin test your herd annually say so in the advertisement. The price need not be given in the advertisement, as this and other information may be taken up by correspondence after you receive the inquiry.

It is almost impossible for us to appreciate the real value and service that the live stock journals are rendering us by sending a copy of our letter to every one of the 50,000 up-to-date, businesslike farmers, including all of those who are in the market for good cattle.

Would You Hire Two Men To Do One Man's Work?

OF course not! Then why buy or put up with a cream separator that uses any more discs than are used in the Sanitary Milwaukee? With practically half the number of discs used in other separators, the Sanitary Milwaukee actually skims closer, quicker and easier. The discs are tapered, allowing greater separating capacity where separation takes place. This together with the fact that the feed glides allow an equal amount of milk to flow between each set of discs — something accomplished in no other separator — explains why the skimming bowl of the

SANITARY Milwaukee CREAM SEPARATOR

Does its work more thoroly, with *less trouble, less work for you.* You have only about half as many discs to clean every time you use the separator. Moreover, the discs of the Sanitary Milwaukee have no holes, pockets or perforations to catch and hold impurities. They are as smooth as glass. Still another reason why they are easy to keep clean, is that they are stamped out of pure aluminum. Every woman knows that aluminum utensils are easier to wash because grease does not stick to aluminum. It can never rust or corrode and thus taint the cream.

Sanitary Milwaukee will give you *all* the cream with less work, yet cost you no more. Write now for complete illustrated catalog and name of dealer nearest you who can show you the *Sanitary Milwaukee.*

Dairy Breeders Hold Meetings.

Dr. David Roberts, of Waukesha, Named President of Ayrshire Association---Reports From Other Breed Meetings.

A PROGRAM of several important addresses was carried out by the Wisconsin Ayrshire Breeders' Association at its annual meeting held in Madison last week. The new officers of the association are as follows: President, Dr. David Roberts, Waukesha; vice president, A. G. Austin, Janesville; secretary-treasurer, Frank T. Stare, of Ladysmith; executive committee, the officers and A. J. McNab, Black River Falls, Adam Seitz, Waukesha, and J. Van Etta, Lima Center. Under the able leadership of President McNab and Secretary Stare the association has grown in the past year from twenty-one to sixty-one members and is now in the most flourishing condition in its history.

Fred Tschudy, of Monroe, told his experiences with breeding Ayrshires. His father had selected the breed, and in an experience of fifty years Mr. Tschudy says he feels that his father used excellent judgment. Sam Jones, of Juneau; Prof. George C. Humphrey, Adam Seitz, of Waukesha; Dr. David Roberts and A. G. Austin discussed matters of interest to Ayrshire breeders. Mr. Seitz discussed best methods to adopt in the show ring where he has been eminently successful. The Ayrshire breeders elected Dr. David Roberts, a delegate to the conference where certification of tuberculin-tested cattle was discussed.

FRANK T. STARE, LADYSMITH.
Re-elected secretary of the Wisconsin Ayrshire Breeders.

The Wisconsin Brown Swiss Cattle Breeders' Association was organized at Madison last week. Fifteen representative breeders were present and the meeting was an enthusiastic one. B. H. Hibbard, of Madison, presided. Sec. Andrew W. Hopkins, of the Wisconsin Live Stock Breeders' Association, addressed the meeting on the purposes and objects of community and state organization. Mr. Hopkins offered the services of the state association in any possible way to assist the Brown Swiss breeders in their work. The officers of the new association are as follows: President, Ira Inman, Beloit; vice president, J. P. Allyn, Delavan; secretary-treasurer, H. C. Taylor, of Orfordville; executive committee includes elective officers and H. W. Ayers, of Honey Creek.

The Wisconsin Jersey Breeders' Association, at its annual meeting in Madison last week elected officers as follows: President, F. F. Showers, of Delavan; vice president, W. H. Clark, of Rice Lake; secretary, E. E. Wyatt, of Tomah. The Jersey breeders had a good, live meeting and considerable discussion of the best methods to advance the interest of this breed of dairy cattle.

The annual meeting of the Wisconsin Holstein Breeders will be held at Watertown March 1st and 2d. An informal meeting was held in the auditorium of Agricultural Hall, Madison, last week, for the purpose of discussing the proposed official certification of cattle which has been tuberculin tested. The Holstein breeders chose Otto Toepfer, and S. A. Baird, a committee of two to meet with the state veterinarian to discuss the subject. Mr. C. J. Shroeder, secretary of the society, was chosen alternate.

HANDLING MILK IN SPRING.

Begin to safeguard the milk before you get it. Use a good, clean cloth and a brush on the cows before every milking. There will be some loose hairs flying at this season of the year. The milk pail is not a good place for them.

See to it that the clothes of the milker are clean. Not always do we pay as much attention to this as we should. We say, "I'll just slip on any old thing. It is good enough to milk in." That makes it easier to have the milk go from the stable with a smell that nature never put there.

Strain the milk as soon as it has been drawn. Cold milk never strains as well as warm.

It is easy to rinse the strainer in cold water, but that cannot make a clean strainer of it. Especially should the cloth strainer be thoroughly scalded and rinsed and then dried in a place where pure air can circulate all about it.

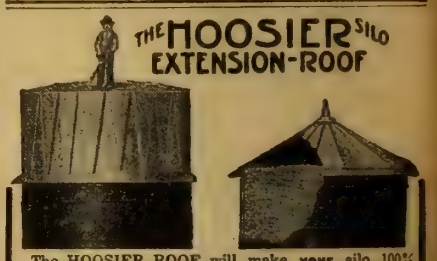
It is a good plan to use a cloth strainer spread over the regular wire sieve strainer. But remember that no strainer ever made can remove impure matter from milk. It must be kept out.

The can into which the milk is strained never should be permitted to stand in the stable while the milking is being done. A small milk room adjoining the stable, with a door between, and that door kept shut, makes it difficult for odors to get into the milk from the stable, but if we have no such room the can may be kept out of doors in the open air, the strainer on top and precaution taken to keep cats and dogs out and to prevent dust from sifting into the strainer.

Every can and pan that touches milk ought to be as clean as water can make it. That water ought to be both hot and cold, too. By this I mean that first the cans and pails ought to be rinsed with cold water very thoroughly. This water should be thrown out and then hot—really scalding hot—water used for washing. The cloth used ought to be perfectly sweet and clean. Some never use soap in washing such things, but do make use of soda. These people think the use of soap never leaves the can or pan or pail free from particles that never should be in milk vessels. Then after the hot water has been used cold water should follow to rinse out and cool the metal. Then the sunshine will do the rest.

As it comes from the cow there is

THE HOOSIER SILO EXTENSION-ROOF



The HOOSIER ROOF will make your silo 100% efficient. No lost space by your ensilage settling. It is the kind of silo roof you have been looking for. Write nearest office for catalogue and learn why HOOSIER customers say that the "HOOSIER ROOF ought to be on every silo."

more or less animal heat in milk. If permitted to remain, this will prevent the milk from keeping as it should. For this reason air ought to be gotten all through the milk as soon as possible after milking. The aerators to be had nowadays are fine, but if we have none we may simply stir the milk well or even pour it from one can into another. The makers of agricultural implements now make a sort of dipper with a long handle for stirring milk and cream that is fine. These do not cost much and are worth a great deal.

Shut the milk away from all smells, not by closing the receptacle tight but by having the room so sweet and clean that there will be none to find its way into the milk.

STATE JUDGING CONTEST SUCCESSFUL.

Seventeen teams of three boys each competed in the statewide stock-judging contest which was held last week at Madison in connection with Farm and Home Week. This was undoubtedly the largest and most important stock-judging contest ever held in Wisconsin and the honors were closely contested.

First honors in team judging went to the three boys representing the Milton (Rock county) high school,

E. R. JONES, MADISON.
Gave demonstrations in drainage and tiling Farm and Home Week.

with a score of 1,402.8 points out of a possible 1,800 points. The Athens team took second with a total of 1,335 points.

Individual honors in judging, which competition was open to all the boys in the teams, went to Howard Holiday, of the Milton school. He was a member of the winning team and his score was 495.5 points out of a possible 600 points.

The summary of the winners follows:

TEAM PLACINGS.

Milton High School, 1st team; Athens, 2d team; Milltown High School, 3d team; Racine County School of Agriculture, 4th team.

INDIVIDUAL JUDGING.

Howard Holiday, Milton High School, 350; William Hoge, Athens High School, 343; Carl Kloth, Pewaukee High School, 332.5; Chas. Turner, Milltown High School, 325.5; Walter Harrison, Darlington High School, 332.5.

Those in charge of the contest were very much pleased and said that many of the boys exercised the judgment of experienced judges in placing and their reasons therefor. T. L. Bewick, who directed the work, said this first state contest would prove of great value and predicted greater interest in judging than ever before, as the entire state was interested in the contest.

The teams were selected in competitions conducted by the high schools having agricultural courses and the county schools of agriculture. These schools were organized into districts, each district containing from three to six schools. Each district held a preliminary stock-judging contest and the winning team in each district was entitled to compete in the state meeting. There were nineteen districts and seventeen teams competed at Madison.

Those entered in the contests by teams and according to the schools they represent follow:

Waldo High—Charles Drewry, Victor Klein and Harry Hill.

Wood County Normal—George Bartels, Orvin Hofschild and Earl Olsob.

West Salem High—Charles Stiven, Roy Cullmen and Rueben Carsel.

Racine County School of Agriculture—Walter Ledger, Stanley Overson and Donald Webster.

Viroqua High—Guy H. Smith, Walter Bean and Raymond Ernest.

Milltown High—Leonard Murphy; Clarence Johnson and Charles Turner.

Marathon County School of Agriculture—Harry Johnson, Almon Peffer and Howard Merwin.

Dunn County School of Agriculture—Ed S. Arkey, Willard Engs and Walter Hubin.

Omro High—Alvin Allen, Wilbur M. Andrew and Charles Foote.

Darlington High—R. D. Smith, Walter Harrison and Kenneth Schreiter.

Sun Prairie High—Frank Wilwarth, Richard Ryan and Slayton Bull.

Mukwonago High—George Carroll, Archie E. Taus and Merl Swan.

Greenwood High—Norman Colly, Fred Behrens and Ernest Nelson.

Milton High—Howard Holiday, Robert Gray and Benjamin Kraus.

Bloomer High—Oscar Weiner, Herman Steab and Jukius Brunstadt.

Athens High—Leo Bloizynski, Alfred Kruetzer and William Hoge.

Pewaukee High—Homer Pearson, Carl Kloth and Roger Taylor.

Dunn county farm names which have been registered recently include the following:

Elm Grove Stock Farm, Anton Amundson, Elk Mound.

Bonnie View Dairy Farm, Robert T. Marshall, Stanton.

Spring Dale Farm, Val Wellstein, Lucas.

Forest City Farm, Riley Drake, Spring Brook.

Rippling Brook Dairy Farm, John F. James, Stanton.

Branching Brook Stock Farm, H. W. Jodell, Stanton.

Sunnyside Home Farm, James Murray, Dunn.

Pleasant View Farm, Martin Simonson, Menomonie.

Old Hickory Stock Farm, R. J. Leischer, Stanton.

Golden Valley Farm, John Erickson, Menomonie.

Silver Creek Farm, George Johnson, Menomonie.

Brookside Dairy Farm, Chris Ulrich, Elk Mound.

Oak Grove Dairy Farm, Louis Brown, Red Cedar.

Morning Star Dairy Farm, Swen Anderson, Sheridan.

Lone Willow Farm, Tim Manore, Dunn.

MAKE YOUR CONCRETE WATER-TIGHT

You can make your hog troughs, silos, feeding floors, concrete stalls, barn and hen house floors, etc., absolutely waterproof by adding

MEDUSA WATERPROOFING

to a comparatively lean mixture of cement, sand and gravel. It saves cement—cuts down the cost of your concrete work—makes it look better and last longer because *it keeps the water out.*

Medusa Waterproofing should be used everywhere in farm concrete work. Only 4 to 8 pounds required for every barrel of Portland Cement. Easy to mix—lasts as long as the concrete. For perfect results

USE READY-WATERPROOFED CEMENT

Your dealer can furnish you the old reliable Medusa Gray Cement and a special Medusa White (for white finish), both waterproofed at the factory by grinding Medusa Waterproofing with the cement in the exact proportions necessary for a perfect water-tight mixture. Ask for dealer's name.

Write today for the following booklets: "Farm Waterproofing," "Pure White Concrete," "Concrete Specifications," "Uses of Cement." *All free.*

CREAMERY REPORTS REFLECT DAIRY POSSIBILITIES.

The future of Upper Wisconsin, it has been repeated, lies in its dairying possibilities. Rich in clover lands, possessed with a soil that is as fertile as any under the sun when cleared and stumped, it offers splendid opportunities for the growing of those feeds which the cow particularly needs and, as the development must come largely through the operation of small farms, dairying appears the surest and the quickest way.

No better indication of these possibilities is available than the reports of the Upper Wisconsin creameries for the year of 1915. Every one of them reflects the increase in dairying which means an increased farming area; more farmers and more tillable land. It requires cows to make creameries and what has been the experience of the butter factories the last year has been the history of the cheese factories. Every report we have seen has shown an increased business and we have yet to hear of one which did not do as well as a year ago.

We have in mind at this writing two Upper Wisconsin creameries—the big co-operative factories at Barron, in Barron county, and Clear Lake, in Polk county. The Barron creamery is doubtless the largest co-operative creamery in the world and last year this one creamery manufactured more butter than was made in the entire upper half of Wisconsin thirty years ago. Of course, every creamery in Upper Wisconsin is not of the size of these two, but the records of these two alone during 1915 are in themselves testimonials to the progress being made in Upper Wisconsin along dairying lines and at the same time they afford that insight into the future possibilities which is drawing hundreds of settlers from older communities.

The Barron creamery produced 1,299,429 pounds of butter, an increase over the previous year of about 17 per cent. For the butter fat used in making this butter the farmers in that vicinity received $334,061.22, which is more than $1,000 a day for each working day in the year. The average price paid for fat was a little over 30½ cents. The Barron creamery is not alone in its field. Within a few miles there are other creameries and cheese factories and considerable whole milk and cream is shipped from that station. Only a few years ago this county was cut-over land and on this cut-over land has grown this large co-operative concern which, as much as anything else, has contributed largely to the prosperity of the community by providing the market through the manufactured product for the product of the hundreds of cows in its cream-gathering radius.

The co-operative creamery at Clear Lake, only a few miles west of the Barron creamery, recently occupied a new building costing $16,000, which is said to be one of the finest in the state. This creamery last year showed a gain of 113,995 pounds of butter manufactured over 1914, the total butter made being 811,110 pounds, for which the farmers were paid $206,866.25. This creamery paid an average of 30.8 cents per pound for its fat and manufactured its butter at a cost of 1.58 cents. It received an average net price for its butter of 27.82 with an average overrun of 21.1 per cent. What has been the experience at Barron has been the experience at Clear Lake and the fact that these two big creameries, closely situated in addition to being surrounded by scores of smaller factories, continue to grow at so rapid a rate certainly bespeaks the dairying possibilities of the great area to the north which is now being opened up and put to use.

MARINETTE COUNTY GRAIN SHOW.

Two points stand out importantly in connection with the first annual grain exhibit by the Marinette County Order of the experiment station:

1. Prof. E. J. Delwiche, of the state agricultural college, said Marinette county is destined to become the producer of pure-bred seed grains for the entire upper part of the state.

2. The majority of the prizes were won by farmers of the newly settled parts of Marinette county, indicating the efficiency of the new settlers in such localities.

Professor Delwiche's statement created a deep impression, because it came from a man who has made farming conditions in Upper Wisconsin practically his life's study. His chief work is carried on at the state experiment farm at Ashland. Due to the county's location on the shores of Green Bay, its altitude and soil conditions Professor Delwiche said it was certain Marinette county would be a pure-bred grain seed producing county.

The exhibit took place at the Marinette county agricultural school on Saturday, January 8th.

It was decided to make the grain exhibit an annual event, to be held each year with the annual meeting of the experiment order. The following officers of the experiment order were re-elected: President, Fred Sweningson; vice president, John Tiedjens; secretary, D. S. Bullock, the latter being of Marinette.

Of the total number of awards new settlers, or farmers in the newly settled localities, won these awards: Eric Michelson, Pembine, first; R. F. Goodman, silver cup (Mr. Michelson took first on Triumphs at the state potato show on Swedish select oats; J. D. Roche, Pembine, second on Swedish select oats; Joachim Carstens, Crivitz, third on Wisconsin early black first, Farmers' Savings & Trust Company silver cup on Wisconsin No. 12 corn; Osborn Siverston, Loomis, second on Wisconsin No. 12 corn; F. E. Luke, Crivitz, first, Lauerman Bros., silver cup on Wisconsin No. 25 corn; C. A. Correll, Crivitz, second in same class; James Tossell, Crivitz, third in same class.

The complete awards follow:

SWEDISH SELECT OATS.

First prize—Eric Mickelson, Pembine, R. F. Goodman, silver cup.
Second prize—J. D. Roche, Pembine, $3 in merchandise, given by J. L. Hersey.
Third prize—Joachim Carstens, Crivitz, $1.

WISCONSIN PEDIGREE BARLEY.

First prize—Max Schlies, Peshtigo, Stephenson National Bank, silver cup.
Second prize—Adolph Feifarek, Peshtigo, two tins Moore's fly spray and sprayer, given by R. A. McDonald.
Third prize—Fred Sweningson, Peshtigo, $1.

WISCONSIN PEDIGREE RYE.

First prize—Morgan Grandy, Wausaukee, First National Bank, silver cup.
Second prize—Max Schlies, Peshtigo, $2 in merchandise, given by W. L. Schulz.
Third prize—Adolph Feifarek, Peshtigo, $1.

WISCONSIN EARLY BLACK SOY BEANS.

First prize—Albert Dettman, Marinette, Farmers' and Merchants' Bank, silver cup.
Second prize—Max Schlies, Peshtigo, $3 street blanket, given by J. B. Eggner.
Third prize—Jachim Carstens, Crivitz, $1.

WISCONSIN NO. 12 CORN.

First prize—Hans Silvertson, Loomis, Farmers' Savings and Trust Company silver cup.
Second prize—Osborn Silvertson, Loomis, $3 fountain pen, given by Krueger's Drug Store.
Third prize—Max Schlies, Peshtigo, $1.

WISCONSIN NO. 8 CORN.

First prize—Fred Cisar, Skidmore Land Company, silver cup.
Second prize—Marvin Loucks, Peshtigo, $3 in merchandise, given by F. W. Woolworth Company.

WISCONSIN CORN NO. 25 CORN.

First prize—F. E. Luke, Crivitz, Lauerman Brothers, silver cup.
Second prize—C. A. Correl, Crivitz, five gallons French San Jose Scale and Oyster Shell Bark Louse Exterminator, given by Watson Brothers.
Third prize—James Tossell, Crivitz, $1.

ASHLAND JUNCTION FARMERS' COURSE.

The third annual Farmers' School will be held at Ashland Junction, Ashland county, Wisconsin, covering a period of two weeks from March 7th to 11th and March 13th to 17th. All farmers attending the school are requested to bring a half peck of grain which was raised in 1915. This will be judged during the course. Those who attend the school will be expected to bring their own lunches, as there are no facilities at the station to accommodate people at meals. George C. Humphrey, of the animal husbandry department, Madison, H. M. Jones, weed expert, and E. J. Delwiche, superintendent in charge of the station, will conduct the school the first week and give most of the lectures and instruction. Frank Kleinheinz, the University shepherd, J. G. Moore, of the Wisconsin College of Agriculture, horticultural department; E. R. Jones, drainage expert, Miss Elizabeth B. Kelley, of the University Home Economics department, and J. G. Halpin, secretary of the Wisconsin Poultry Association, will have charge of most of the work the second week. Farmers who desire to attend this course should write to Prof. E. J. Delwiche, and state in their letter whether they will want to attend the course the first week or the second week.

Drive Your Fence Posts Like a Stake

The modern way of fence building. No holes to dig or posts to set if you use Chicago Steel Fence Posts. Driving 320 posts a day is an easy job for a man and a boy. Then you're ready to staple up the wire and fence your land in one-fifth the time. There is no breaking, no wearing out. Your

Fence is Up to Stay

You can burn out your fence rows, destroying weeds and insects, and give your farm a clean, prosperous appearance. No danger of having your stock killed by lightning during a storm, because Chicago Steel Posts ground lightning. Don't wait till all wood posts rot to build an entire new fence. Replace rotten wooden posts with guaranteed Chicago Steel Posts now. You'll soon have a new all-steel fence. Write today and let us send you the best book you ever saw on fencing.

HEPSEY BURKE--A Sister to David Harum

By G. N. Wescott, the Brother of the Author of "David Harum."

(Copyright 1915.)

SYNOPSIS.

Hepsey Burke with the Junior Warden met the new pastor, Donald Maxwell, at the depot, giving him a welcome to his new parish. During the ride out to Thunder Cliff, Hepsey's home, she gave Maxwell in her outspoken way a very clear idea of the requisites or, as she put it, what the "parish wanted in the shape of a pastor." Having arrived at Thunder Cliff, Maxwell settled himself in the room assigned to him and then while resting read a letter from "Betty." However, he decided not to tell Mrs. Burke of her just yet. The new pastor's first call was upon the Senior Warden, receiving a hearty welcome from Virginia Bascom, his daughter. Hepsey surmised that Maxwell was engaged and made a neighborly call upon Jonathan Jackson, the Junior Warder, to see what he thought about the matter.

CHAPTER V—Continued.

Mrs. Burke opened the blinds and windows, shook up the pillows on the lounge, straightened the furniture, dusted off the chairs and opened the door to the porch. She made a flying trip to the garden and returned with a big bunch of flowers which she placed in a large glass vase on the mantel. Then she hung Jonathan's dressing gown over the back of a chair and put his slippers suggestively near at hand. In a few moments she had transformed the whole appearance of the room, giving it a look of homelike coziness which had long been foreig to it.

"There now, Jonathan! That's better, isn't it?"

"It certainly is, Hepsey; it certainly is. I wonder why a man can't do that kind of thing like a woman can? He knows somethin's wrong, but he can't tell what it is."

Hepsey had almost forgotten her errand, but now that her work was done it came back to her with sudden force; so, puckering up her lips and scowling severely at the carpet, she began:

"The fact is, Jonathan, I didn't come over here to dust the parlor or to jolly you. I've come to have a confidential talk with you about a matter of great importance."

"What is it, Hepsey?"

"Matrimony."

Jonathan started eagerly and colored with self-conscious embarrassment; and after clearing his throat, nervously inquired:

"Did you think of contemplatin' matrimony again, Hepsey?—though this ain't leap year."

"I, contemplate matrimony? Oh, land of Gideon, no. It's about someone else. Don't get scared. I'm no kidnapper!"

"Well, who is it, then?" Jonathan inquired, with a touch of disappointment.

"My adopted son."

"You don't say! I've heard rumors about Maxwell and Virginia Bascom, but I didn't take no stock in 'em, knowin' Virginia."

"Virginia hasn't nothin' to do with it."

"Well, who has then, for land's sake!"

"I don't know the girl's name, but I saw her picture on his mantelpiece yesterday mornin', and I've had my suspicions for some time."

"Well, I suppose his marryin' ain't none of our business anyway, be it?"

"Yes, it is our business; if he's goin' to get married, the rectory's got to be fixed over a whole lot 'fore it's fit to live in. You know the Senior Warden won't lift his finger, and you've got to help me do it."

Jonathan sighed profoundly, knowing from past experience that Hepsey's word carried more weight than all the vestry.

"I suppose I have, if you say so, Hepsey."

"Yes sir, you've got to help me do it. No decent girl is goin' into that house as it is with my consent. It's the worst old rat-trap I ever saw. I've got the key and I'm goin' through it this afternoon and then I'm going' to plan what ought to be done."

"But it seems to me you're venturin' some. You don't know they're goin' to be married."

"No, but all the symptoms point that way and we've got to be prepared for it."

"But the people round town seem to think that Virginia has a first mortgage on the rector already."

"No doubt she thinks she has, but it ain't true. He's made a blunder, though, not announcin' his engagement, and I'm goin' to tell him so the first chance I get. I don't see why he should air his private affairs all over the town, but if he don't announce his engagement before long Virginia Bascom'll make an awful row when he does."

"Yes, and to the best of my knowledge and belief this'll be her fifth row."

"Well, you meet me at the rectory at two o'clock sharp."

"But we ought to consult the vestry first," the Junior Warden cautioned her.

"What for, I'd like to know?"

"'Cause they are the trustees of the property."

"Then why don't they 'tend to the property? The vestry are a lot of—"

"Sh! Hepsey, be careful. I'll be there, I'll be there!"

Mrs. Burke rose and started for the door, but Jonathan called out to her:

"Hepsey, can't you stay to dinner? I'd like awful well to have you. It would seem so nice and homelike to see you sittin' opposite me at the table."

"Am I to consider this a proposal of marriage, Jonathan?"

"Well, I hadn't thought of it in that light, but if you would I'd be mighty thankful."

But Hepsey was beating her retreat.

Jonathan stood for a minute or two in the middle of the room and looked very sober. Slowly he took off his coat and put on his dressing gown. Then he sat down and cautiously put his feet in another chair. Next he lighted a cigar—gazing about the room as if his late wife might appear at any moment as an avenging diety and drag him into the kitchen where he belonged. But nothing happened, and he began to feel a realization of his independence. He sat and thought for a long time and a mighty hunger of the heart overwhelmed him. Before he knew it a tear or two had fallen on the immaculate carpet; and then, suddenly recollecting himself, he stood up, saying to himself—such is the consistency of man:

"Sarah was a good soul accordin' to her lights, but she's dead and I must confess I'm powerful reconciled. Hepsey Burke's different. I wonder if—"

But he put the thought away from him with a "get thee behind me" abruptness and, putting on his coat, went out to water the stock.

CHAPTER VI.

The Missionary Tea.

"HM!" MRS. BURKE remarked to Maxwell abruptly one day during supper. "We haven't had a missionary tea since you came, and I think it's high time we did."

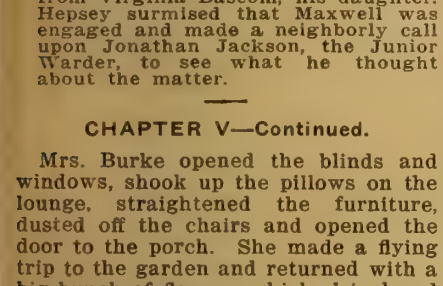
"What sort of a missionary tea do you mean?" the parson inquired.

"Well," Mrs. Burke responded, "our missionary teas combine different attractions. We get together and look over each other's clothes; that the first thing; then someone reads a paper reportin' how things is goin' in Zanzibar, or whats doin' in Timbuctoo. Then we look over the old clothes sent in for missionaries, mend 'em up, and get 'em ready to send off. Then we have tea and cake. I've had my misgivin' for some time that perhaps we cared more for the tea and cake than we did for the heathen; but of course I put such a wicked thought aside. If you value your reputation for piety, don't you ever speak of a missionary tea here except in a whisper."

"But I suppose the tea helps to get people together and be more sociable?"

"Certainly. The next best to religion is a cup of strong tea and a frosted cake, to make us country people friends. Both combined can't be beat. But you ought to see the things that have been sent in this last week for the missionary box. There's a smoking jacket, two pairs of golf trousers, several pairs of mismated gloves, a wonderful lot of undarned stockings, bonnets and underclothing to burn, two jackets and a bathin' suit. I wonder what people think missionaries are doin' most of the time!"

On the day appointed for the missionary tea the ladies were to assem-



Look into the Farm Journal

Judge it by its editorial excellence—its progressiveness—its wholesome educational matter—its influence for everything that is right—**not by its price.**

The first farm paper to reach 1,000,000 circulation. Only farm paper with so many long-term subscriptions. That explains its low price to you.

You'll never miss its price, but you would miss its arrival once you started to read it. $1 for 5 years. Your money back for unexpired time whenever you think you are not getting more out of it than you put in.

Your Boy's Future

Help Him to Become a Land Owner in Fertile Montana

Thousands of farmers in the past have become wealthy by securing good land when it was cheap. Montana today offers just such an opportunity—land known to produce big—but not thickly settled. 18,000 farm families a year are settling here and this will make land values increase yearly.

Now is the time to get a Montana farm for yourself or your boy. You can live here just as comfortably, make considerable more money yearly and have the land multiply in value all the time.

Send now for a reliable Montana booklet; study it this winter, then in the spring buy a round trip excursion ticket and visit this country

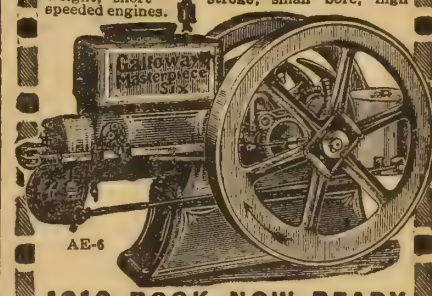
GET MY PRICE

WAIT! Don't buy a gasoline engine of any make or kind or price until you FIRST get my New Low 1916 Prices, terms and easy buying plans. Remember! I was the first engine manufacturer building high quality engines in my own great chain of factories, and selling them direct to the farms and shops of America with only one small profit added to actual cost of material and skilled labor. As my factory volume has increased

DOWN HAVE GONE PRICES until today they are lower than ever. Year in and year out I have built and sold more engine power for less money than any manufacturer, because of perfected, simple design and the high quality I build into my engine. Customers get the service and satisfaction out. Heavy weight, large bore and long stroke, valves in the head, with extra cooling surfaces, perfected oiling system, economy carburetor, built in magneto, hercules strength cylinder head efficiently water cooled. These features, and many others, make the Galloway Masterpiece engines power kings in every field. All sizes from 1 3-4 H. P., air-cooled, light work engines, stationary and portable, to 16 H. P. Heavy duty engines at lower prices than ever before.

DON'T GET FOOLED! by the kind of talk intended to sell you light weight, short stroke, small bore, high speeded engines.



1916 BOOK NOW READY

Get my new 1916 special proposition and 250 page book, process printed in four colors. It will tell you the truth about the engine business. A postal gets it. Engines shipped from Waterloo, St. Paul, Kansas City, Council Bluffs and Chicago.

NEW SELLING PLANS

WE PAY $80 A MONTH SALARY AND furnish rig and all expenses to introduce our guaranteed poultry and stock powders. Bigler Company, X 660, Springfield, Illinois

ble at Thunder Cliff at four o'clock; and when Maxwell came home, before the advent of the first guest, he seemed somewhat depressed; and Mrs. Burke inquired:

"Been makin' calls on your parishioners?"

"Yes, I have made a few visits."

"Now you must look more cheerful, or somebody'll suspect that you don't always find parish calls the joy of your life."

"It's so difficult to find subjects of conversation that they are interested in. I simply couldn't draw out Mrs. Snodgrass, for instance."

"Well, when you've lived in the country as long as I have, you'll find that the one unfailin' subject of interest is symptoms—mostly dispepsy and liver complaint. If you had known enough to have started right with Elmira Snodgrass, she would have thawed out at once. Elmira is always lookin' for trouble as the sparks fly upwards, or thereabouts. She'd crawl through a barbed wire fence if she couldn't get at it any other way. She always chews a pill on principle, and then she calls it a dispensation of Providence, and wonders why she was ever born to be tormented."

"In that case," laughed Maxwell, "I'd better get some medical books and read up on symptoms. By the by, is there any particular program for this missionary meeting, Mrs. Burke?"

"Yes, Virginia Bascom's goin' to read a paper called 'The Christian Mother as a Missionary in Her Own Household.' To be sure, Ginty's no Christian mother, or any other kind of a mother; but she's as full of enthusiasm as a shad is of bones. She'd bring up any child while you wait, and not charge a cent. There goes the bell, so please excuse me."

The guests were received by Mrs. Burke. Miss Bascom entered the parlor with a portentous bundle of manuscript under her arm, and greeted Donald with a radiant smile. Pulling a pansy from a bunch in her dress, she adjusted it in his buttonhole with the happy shyness of a young kitten chasing its tail. After the others had assembled they formed a circle to inspect the clothing which had been sent in. There was a general buzz of conversation.

As they were busily going through the garments, Virginia remarked, "Are all these things to go to the missionaries at Tien Tsin?" and she adjusted her lorgnette to inspect the heap.

"Yes," Mrs. Burke responded wearily, "and I hope they'll get what comfort they can out of 'em."

"You don't seem to be very appreciative, Mrs. Burke," Virginia reproved.

"Well, I suppose I ought to be satisfied," Hepsey replied. "But it does seem as if most people give to the Lord what they can't use for themselves any longer—as they would to a poor relation that's worthy, but not to be coddled by too much charity."

"I think these things are quite nice enough for the missionaries," Virginia retorted. "They are thankful for anything."

"Yes, I know," Mrs. Burke replied calmly. "Missionaries and their families have no business to have any feelings that can't be satisfied with second-hand clothes, and no end of good advice on how to spend 5 cents freely but not extravagantly."

"But don't you believe in sending them useful things?" Virginia asked loftily.

"So I do; but I'd hate that word 'useful' if I was a missionary's wife."

"Might I inquire," asked Miss Bascom meekly, "what you would send?"

"Certainly! I'd send a 25-cent scent bag, made of silk and filled with patchouli-powder," said Hepsey squarely.

"Well," Virginia added devoutly, "sachet bags may be well enough in their place; but they won't feed missionaries, or clothe them, or save souls, you know, Mrs. Burke."

"Did anybody say they would?" Mrs. Burke inquired. "I shouldn't particularly care to see missionaries clothed in sachet bags myself; the smell might drive the heathen to desperation. But do we always limit our spending money to necessary clothes and food? The truth is, we all of us spend anything we like as long as it goes on our backs, er down our throats; but the moment it comes to supportin missionaries we think 'em worldly and graspin' if they show any ambition beyond second-hand clothes."

"Do you live up to your preachin', Mrs. Burke?" a little sallow-faced woman inquired from a dark corner of the room.

"Oh no; it hits me just as hard as anybody else, as Martin Luther said. But I've got a proposition to make. If you'll take these things you brought back with you and wear 'em for a week just as they are and play you're the missionaries I'll take back all I've said."

As, however, there was no response to this challenge, the box was packed and the cover nailed down.

(It is perhaps no proper part of this story to add that its opening on the other side of the world was attended by the welcome and surprising fragrance of patchouli, emanating from a little silk sachet secreted among the more workaday gifts.)

The ladies then adjourned to the front piazza, where the supper was served.

When the dishes had been cleared away the guests adjusted their chairs and assumed attitudes of expectant attention while Virginia stood up and shyly unrolled her manuscript, with a placid, self-conscious smile on her countenance. She apologized for her youth and inexperience, with a moving glance towards her pastor, and then got down to business. She began with the original and striking remark that it was the chief glory and function of woman to be a homemaker. She continued with something to the effect that the woman who forms the character of her children in the sancity of the home-life rules the destinies of the world. Then she made a fetching allusion to the "Mother of the Gracchi," and said something about jewels. Nobody knew who the "Gracchi" were, but they supposed that they must be some relatives of Virginia's who lived in Boston.

She asserted that the modern methods of bringing up children were all wrong. She drew a striking picture of the ideal home in which children always stood modestly and reverently by their parents' chairs, consumed with anxiety to be of some service to their elders. They were always to be immaculately neat in their attire and gentle in their ways. The use of slang was quite beneath them.

These ideal children were always to spend their evenings at home in the perusal of instructive books and the pursuit of useful knowledge. Then, when half past seven arrived they were to rise spontaneously and promptly and bid their parents an affectionate good night and retire to their rooms, where, having said their prayers and recited the golden text, they were to get into bed.

Portions of Virginia's essay were quite moving. Speaking of the rewards which good mothers reap in the virtues and graces of their dutiful offspring she said:

"What mother does not feel a thrill of exquisite rapture as she fondly gazes into the depths of her baby's eyes and sees there the budding promise of glorious womanhood. What mother does not watch the development of her little son with wondering pride, as she notes his manly, simple ways, his gentle reverence, his tender, modest behavior. What mother——"

Here Virginia came to an abrupt stop, for there was a terrible racket somewhere overhead on the piazza roof; a rope was suddenly dropped over the edge of the eaves and almost immediately a pair of very immodestly bare legs were lowered into view, followed by the rest of Nickey Burke's person, attired in his nightshirt. It was the work of a moment for the nimble boy to slide down the rope onto the ground. But, as he landed on his feet, finding himself in the august presence of the missionary circle, he remarked "Gee Whitaker bee's wax!" and abruptly took to his heels and sped around the house as if he had been shot out of a gun.

(To be continued.)

A PREMO CAMERA

Is a Necessity--Not a Luxury

This camera is made by the Eastman Kodak Co., is of the box type, with universal focus lens, the simplest instrument for picture-making that can be devised. It will produce excellent results in the hands of anyone; no experience necessary. Film pack used, daylight loading. Pictures 2 1-4 x 3 1-4. Booklet of instructions included with each camera.

HAVE YOU ALWAYS REGARDED A CAMERA AS MERELY A "PLAY-THING?"

What do you raise?

Fruits? Livestock? Grain? Flowers?

It doesn't matter--whatever it is, you raise it to sell, don't you? Now, how much better than "telling" distant prospective customers what you have, is ***showing*** them! You can't bring them to your farm, but pictures will get practically the same result. One picture tells more than pages of words.

What better way of keeping a record of growth, than by pictures?

A Picture of old Dobbin with Baby on his back, will be priceless twenty years from now.

HERE'S HOW YOU CAN GET A CAMERA--

Given with The Housewife for one year at $1.80. Cameras sent postpaid, delivery guaranteed.

Remit by P. O. Money Order or Registered Letter. Address

The HOUSEWIFE, 30 Irving Place, New York City

THE HOME

HEADACHES.

One of our readers writes as follows:

I enjoy reading the Home Department and I find many useful helps for the household. I would like to ask if anyone can tell me what to do for headaches. I have been subject to dreadful headaches for years and I would be very thankful if anyone could tell me something that would relieve me.

At the outset we want to say: Don't use patent headache cures. They may give temporary relief, but most of the drugs of which they are composed have a depressing effect on the circulation and may weaken the heart, in which case you have a worse trouble than headache on your hands.

Headache is a symptom, not a disease, and as a rule the real cause of the pain lies in other organs than the brain. The safest plan is to consult a physician and by proper medical treatment remove the cause. If all other organs of the body are in first-class shape there will not likely be much trouble with the head.

Headaches are most frequently caused by disorders of the digestive tract, as indigestion and constipation; second, abnormal condition of the eyes, ears, nose or throat; third, diseases of the pelvic organs; fourth, nervousness and fatigue.

On this subject of headaches one authority, Dr. Alice Farnham Leader, has this to say:

Headaches from digestive causes are usually frontal, although sometimes there may also be pain in the back of the neck. Moving the head aggravates the symptoms. The pain occurs because certain toxic substances have not been eliminated from the system. Naturally, the prevention of the toxaemia is to avoid such articles of diet as are known to disagree, and also to secure free elimination by the kidneys, the bowels and the skin. Drink plenty of water, and eat freely of fruit and vegetables; the liver should be relieved by a cathartic now and again.

The immediate treatment of an attack is to move the bowels by castor oil, salts or a Seidlitz powder; an enema is a very good adjunct to the cathartic. Plenty of very hot water should be ingested. Often a hot water bag placed over the stomach will relieve the pain.

Headaches from eye strain are located in the forehead around the eyes, and in the eyes, and often in the back of the neck. Using the eyes makes the pain worse, while a period of rest frequently gives temporary relief. Properly fitted glasses will be necessary to effect a cure.

Headaches from disease of the nose, ears, or throat will be associated with catarrh or other symptoms pointing to the organ affected and permanent relief can be obtained only by treatment of the cause by a reliable physician.

The headache of pelvic origin is usually located on the top of the head, and sometimes is felt only in a spot about the size of a silver dollar; for this the doctor must again be consulted, that the cause may be removed.

A nervous headache is usually felt in the forehead, the back of the neck, or the top of the head. There is often marked mental depression, as well as a feeling of heaviness especially on wakening in the morning. Such a headache is a warning of exhaustion of the nerves from overwork or worry, and if this danger signal is disregarded the result may be a nervous breakdown.

In all cases it is best to seek the advice of a competent physician. Much harm can be done to the general system by the ill-advised use of drugs, and the first step toward ridding one's self of headache is to get the system in perfect condition, indeed, when the general health is as it should be there will be no more headache to doctor.

FOUR-LEAF CLOVER EDGE.

Chain five, double crochet twice in fourth stitch back; chain four, double crochet twice in fourth stitch back (which will be center of clover); chain three, slip stitch in same stitch (center); chain three, double crochet twice in same stitch (center); chain three, slip stitch in same stitch (center); chain three, double crochet twice in same stitch (center); chain three, slip stitch in same stitch (center); chain three, slip stitch in top of first leaf. This makes the first clover.

*Chain eleven, double crochet twice in fourth stitch back; chain four, double crochet twice in fourth stitch back (which will be center); join with slip stitch in center of third leaf of clover just made; chain three, slip stitch in same stitch (center); chain three, double crochet twice in same stitch (center); chain three, slip stitch in same stitch (center); chain three, double crochet twice in same stitch (center); chain three, slip stitch in same stitch (center); chain three, slip stitch in top of first leaf. Repeat from *.

WANTS TO HEAR FROM OTHERS.

To the Editor:—As I have a very healthy baby I will send you a picture of her and myself. Her name is Doris

MRS. ALMA SCHAFFER AND HER THREE-MONTHS-OLD DAUGHTER, DORIS MARIE.

Marie. She is three months old and has light hair and blue eyes.

She has always had plenty of fresh air and sunshine. I hope to hear from some more mothers who have fresh air babies. Mrs. Alma Schaffer.

PERSONAL FAITH IN CHRIST THE ESSENTIAL THING.

To the Editor:—While not an authority on the subject, perhaps I can give "A Constant Reader" some light on the subject of the creeds of the different churches.

Were we to sum up the beliefs of the orthodox churches (Methodist, Baptist, Presbyterian, etc.) I think we would find it in the Apostles' Creed, which we all know.

The one fundamental fact on which they all stand is that we have salvation alone through faith in Christ as the Son of God. They may differ somewhat about the mode of baptism, about church government, etc., but they are all serving the same Christ. So, to my mind, it doesn't make so much difference to what church one belongs, the chief thing is to have a real, personal faith in Christ as a living Savior. Nor is it absolutely necessary to salvation to belong to any church. But when one becomes a Christian he naturally wants to be associated with people of like mind. The church is an inspiration to better living and, if a Christian, why not join it and go to work for other people? The church has made mistakes and sometimes isn't all that it should be, but it is God ordained, so let's stand by it.

Merely uniting with the church, however, doesn't make one a Christian. The Bible declaration is, "Believe on the Lord Jesus Christ and thou shalt be saved."

I do not know much about the distinctive teachings of the Presbyterian church. The Methodist church teaches the doctrines of a universal gospel, of free will (that is, through Jesus Christ God has provided salvation for all men so that whosoever will may be saved from sin); that whosoever is a Christian may know that fact in his own heart and spirit; that a Christian may be cleansed by grace from all sin and love God with all his heart and his neighbor as himself.

A Minnesota Reader.

ANOTHER PAIR OF TWINS.

To the Editor:—As I have seen so many baby pictures in your paper and only one pair of twins I thought I would send the picture of our twin girls, Alma and Velma Luckow.

At the time this picture was taken they were four months old and weighed fifteen pounds. They are now twenty-two months old. They weigh-

ALMA AND VELMA LUCKOW.

ed four and five and a quarter pounds when they were born.

They were brought up on mother's milk.

I hope to hear from more mothers, as I enjoy reading their letters.

Mrs. F. C. Luckow.

CREED IS INTERPRETATION OF BIBLE'S TEACHINGS.

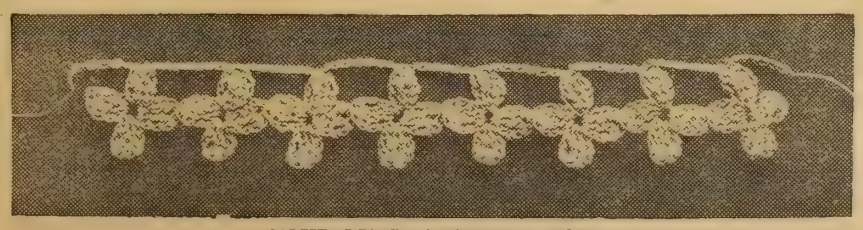
To the Editor:—Replying to "Constant Reader" in the February 3d issue will say that a church's creed is its belief, doctrine and teachings. The reason churches differ in creed is because of the different interpretations put upon the things the Bible teaches. I will name only one, baptism.

Some churches believe in infant baptism, while others hold that baptism follows believing and is a voluntary act on the part of the believer. Still others insist that baptism to be strictly in accordance with the Bible must be by immersion, while others hold that sprinkling or pouring fulfills the Bible's teachings.

The church member that feels that he or she is above the members of another church because their creed is not the same is in my opinion, a poor Christian. A Christian's guide should be his Bible; the interpretation that he puts upon it his creed.

He can be a good Christian without uniting with a church, but he does not fulfill the Bible's teachings unless he does his very best for the Lord's work which cannot be done unless he is one of a body of Christian workers for in union there is strength.

A Reader.



FOUR-LEAF CLOVER EDGE.

CORRECT HEIGHT FOR KITCHEN TABLE.

Backaches and worry; then tears! That is the order of things in kitchens where the tables are too low. Sometimes the children are blamed, but it isn't their fault. It's the table. It is a few inches lower than it should be and the muscles of the back are strained.

"There is a correct height for every table in every kitchen," says Miss Rebecca Bartholomew, assistant in domestic science in the Kansas State Agricultural College. Experiments have been conducted in her department which prove that the correct height for a table when a woman is four feet seven inches tall is twenty-seven inches. If the housewife is five feet five inches tall the kitchen table should be thirty and one-half inches high. In other words, for every five inches difference in a woman's height there must be a corresponding change of two and one-half inches in the height of the table.

NEEDS ASSISTANCE IN CAKE BAKING.

To the Editor:—I am having so much trouble with my cakes and I have been wondering if some of the readers of the Home Department could not help me. The cakes rise fine in the oven and seem to be baked through, but as soon as they are taken out they drop and are coarse grained. Can anyone tell me where the trouble lies? I have used different kinds of baking powder, but it is always the same. Would be thankful to anyone who tells me what is the matter, as I love fine grained cakes. Do you think the sugar could be the cause of it? A Reader.

THE COOKING OF BEEF.

The various cuts of beef differ in tenderness, flavor and cost according to the part of the animal from which they are taken. The nutritive value of all cuts is practically the same.

The parts which have least exercise and least connective tissue (all rib and loin cuts) are the juciest and most tender. The shoulder portions, the rump, round, chuck are the next, while the neck and leg portion are the toughest and least desirable in flavor, though their nutritive value is as great as the other.

Much money is wasted by the improper cooking of the high-priced cuts. Since rib portions (prime roasts) cost more simply because they have more highly flavored juices and are more tender they should be so cooked as to retain as much of their juice as possible. As cooking for tenderness is not necessary the only other requirement is the development of the proper color.

Heat a pan or roaster and place the meat in it, turning until all cut surfaces are well seared. Do not use a covered roaster. The searing makes a coat or crust on the outside which prevents the escape of the juices. The meat is literally "cooked in its own juices." If the roast is placed properly the melted fat will run down the sides and baste the meat sufficiently. The degree of cooking depends upon personal taste. No water need be used. When water is used or a cover placed on the pan the resulting steam will break the seal and allow the juices to exude. Thus the special

value of the high-priced cut is lost. Salt should not be added at first, as it tends to draw out the juices. Persons who enjoy the delicate flavor of meat prefer to season it on serving.

The above method of cooking gives a very juicy roast. On carving the juice will "follow the knife." When water is used or a covered roaster a dry meat results—as practically all of the juice is thus extracted.—[May C. McDonald.

FOR THE HOUSEWIFE.

When plaster of paris is used to fill cracks in the plaster mix it with vinegar instead of water. It will not harden so quickly, whereas if water is used the paste will harden before you can successfully use it.

If paint brushes have dried stiff with paint in them let them simmer a few minutes in vinegar which has been brought to the boiling point. Remove and wash thoroughly in strong soap suds.

DOROTHA GENEVIEVE ROWE.

I am the only little child of Mr. and Mrs. Willis Rowe. I get lots of fresh air and a drink of water several times a day. I am five months old and weigh sixteen and one-half pounds.

Perspiration stains can be removed by a solution of oxalic acid and water in a proportion of one drop of oxalic acid to twenty drops of water.

If a bay leaf is added to tomato soup it will give it a delightful flavor.

Seeded raisins cut in half and added to a nut salad will make it taste much better.

FUDGE SANDWICHES.

The natural desire for sweets may be satisfied in a very good way by giving fudge sandwiches to children from six to sixty, says Miss Bab Bell, of the Missouri College of Agriculture. Beat fudge until creamy, and while still soft spread between thin slices of buttered bread. If not cooked too hard it may be kept in a bowl covered with a moist cloth for use as filling later.

RECIPES.

Doughnuts.—Two eggs, large cup of sugar, seven tablespoonfuls melted lard, one pint of sour milk, one teaspoonful of soda, salt, nutmeg and flour enough to make a soft dough.—M. P.

Cookies.—One cup of sour cream, one-half cup of butter, one teaspoonful of soda, salt, nutmeg and flour enough to make dough just so it can be handled.—F. C.

Creamed Small Onions.—Four cupfuls of peeled onions, one cupful of milk, two tablespoonfuls of butter, two tablespoonfuls of flour, two teaspoonfuls of salt, pepper to taste. Cook the onions in boiling water forty minutes; drain (saving the water for soup.) Cover with the milk; add the salt and pepper, and bring to a boil; add the butter and flour, which have been rubbed together until smooth, and boil for three minutes. Always have the butter soft before adding the flour.

Baked Hashed Potatoes.—Eight cupfuls of boiled and chopped potatoes, one cupful of grated onion, one cupful of milk, one tablespoonful of salt, a dash of pepper, one tablespoonful of drippings. The potatoes should be washed and boiled with the skins on, then pared and chopped fine while hot. Put the drippings and onion into a baking pan, and heat through; add the potatoes, the salt and pepper; mix well, smooth the top, and pour the milk over all. Put in a hot oven for thirty minutes or until a nice light brown. Sprinkle with parsley.

Ginger Sandwiches.—Mix one-fourth cupful of finely chopped preserved Canton ginger and one-third cupful of chopped pecan nut meats. Add two tablespoonfuls of finely cut candied orange peel, one tablespoonful of ginger sirup, one teaspoonful of vinegar and a few grains of salt. Spread between thin unsweetened crackers. These are quickly made and are nice served with tea.

Creamed Pork.—Cut three slices of fat salt pork in small cubes, try out and drain. Put two tablespoonfuls of pork fat into a saucepan, add three tablespoonfuls of flour and stir until well blended. Then pour on gradually, while stirring constantly, one cupful of milk. Bring to the boiling point and season with one-half teaspoonful of salt and a few grains of pepper. Add one and one-half cupfuls of cold roast pork, cut in small cubes, and when thoroughly heated add pork scraps.

Ham and Vegetable Soup.—One cup canned corn, one large onion, one cup canned tomatoes, one ham bone, one large potato, salt. Boil the ham bone until any meat on it is tender. Remove the bone and cook the vegetables in the meat stock. Add the cooked ham, season and serve.

All letters from boys and girls to this department should be sent to office of The Wisconsin Farmer, Madison, Wisconsin.

GEORGE WASHINGTON.

As you all know, George Washington lived on a big farm in Virginia. The farm overlooked the Potomac river and Mr. Washington had his own dock where the big ships sailed up to be loaded with tobacco from the plantation.

Those ships had a great fascination for the boy George and he vowed that public school like you little folks—he learned his lessons from his mother when he became a man he would go to sea and be a sailor and he listened with all his ears to the tales the seamen told him.

George Washington didn't go to a and Mrs. Washington was very strict and stern so that George had to learn his lessons thoroughly. One of the biggest lessons she taught him was obedience, which probably was one reason he was such a good soldier. Also, it helped her in later years, for George's father died when he was eleven years old and his mother guided him to manhood alone.

George was contented on the farm for four years after his father's death and then, when he was fifteen, he decided he wanted to go to sea. He sought and secured his mother's consent and got all ready for the life of a sailor. But he was doomed to disappointment. An uncle in England got wind of the plan and sent to Mrs. Washington a letter in which he begged her not to let him go if she cared anything for his future. Life on the sea was not in those days what it is now and he feared that the boy would be mistreated. Mrs. Washington hated to disappoint the boy, but she knew his uncle must know what he was talking about, so she showed George the letter and told him he must give up the plan.

MARLETA ANNA RAKOW.
Daughter of Mrs. F. Rakow.

Now young George had a bad temper and it flared up at this interference with his dearest dream. But fast on the heels of his anger came love for his mother and he swallowed the hurt and said, "I shall stay, mother, if you wish it." And his mother softly answered, "I thank you, son; God grant you may never regret the choice."

George Washington never did regret his choice. I think he must have been very, very glad when the stirring days of his service to his country came that he had obeyed his mother, for had he gone to sea he perhaps would never have been able to fill the place that made him the "father of his country."

MY PETS.

Dear Young Folks:—I love to read your stories and I thought I would tell you a story of my pets. One day this spring I went into the wash house and there I saw the mother cat had made her nest with five kittens. When the

kittens were one week old one was killed.

One sunny morning I put my chickens and duck in a basket out in the sun. In a short time I heard them crying. I went out and saw the cat with one chicken in her mouth. I thought she was going to eat them, but she did not. The chicken cuddled down beside her and stayed there for quite a while. When it went out doors the cat would go out and carry it back into the nest. The chicken slept there for a long time and then one day it got its head caught in the door and was killed. —Mildred.

ANOTHER STORY ABOUT GEORGE WASHINGTON.

Dear Young Folks:—I am a reader of the Young Folks page and I am going to send you a story about George Washington. His home was near a great river. His father was rich and there were so many storehouses on the place that it almost made a town of itself.

Mr. Washington was very fond of horses and after he died, when George was still a boy, Mrs. Washington had to take care of them. Her favorite horse was a sorrel. One day George's playmates were there and they were playing around the horses and George said, "If you will put the bridle on the horse and catch him I will ride him." So they caught the horse and George got on him to ride. The horse kicked and jumped and at last he gave a great plunge and fell to the ground, dead.

Early one morning Mrs. Washington asked George if he had seen anything of her favorite horse. "Yes, madam, I killed him. I tried to ride him and he gave a jump and fell to the ground, dead." She looked sadly at him and said, "I am sorry that my favorite is dead, but I am glad that my son always speaks the truth."
—William.

WHAT EVERY WISE CHILD SHOULD DO.

If I want to be happy
And quick on my toes,
I must bite my food slowly
And breathe through my nose.

I must press back my shoulders,
And hold up my head,
And not close my window
When going to bed.

I must soap my bath-flannel,
And scrub all I know;
I must then take a towel
And rub till I glow.

I must never be idle,
And loll in my chair;
Or shout like a demon,
And act like a bear.

I must play and not fidget,
Read books and not flop;
Begin all with a purpose,
And know when to stop.

I must know what is noble,
And do what is kind;
I must strengthen my body
And tidy my mind.

Yes, if I would be healthy,
And free from all cares,
I must do all I've told you,
And mean all my prayers.
—Anon.

International Sunday School Lesson

Lesson for February 20, 1916
(By E. O. SELLERS, Acting Director of Sunday School Course.)

CHRISTIAN BROTHERHOOD.

LESSON TEXT—Acts 4:32-5:16.

GOLDEN TEXT—Love one another from the heart fervently.—I Pet. 1:22 R. V.

The Sanhedrin had tried threatening upon the disciples and this is generally pretty weak business. But their threat meant danger and the disciples were not unduly puffed up over their deliverance. With all their believing friends they prayed, and in response the Holy Spirit came upon them in still further measure (4:23-31).

I. The Spirit-Filled Believers, 4:32-37. The two sections of this lesson are really one and are designed to bring out sharply the contrast between the Holy Spirit-filled church and an evil spirit-filled man. The communism of the early church was (a) Christian communion (See 2:44); and it was (b) for a special occasion; (c) it was benevolent—each had according to his "needs" (4:34, 35); (d) it was voluntary (5:4), and (e) it recognized the right to private property (See 5:4, 9). He, the Holy Spirit, does bring that unity, that altruism, those active social relations and services of which Pentecostal communism is the type. Unity and love are seen in genuine Christianity in all ages, but the forms of their expression may differ. The power of the Holy Spirit was manifested, not merely in love and unity which it produced, in the brotherhood thus evidenced, but also in the testimony given for the Lord Jesus Christ, "with great power gave the apostles witness to the resurrection of the Lord Jesus." There is much witness to the resurrection of the Lord Jesus Christ in our day, but not always "with great power." When we are filled with the Holy Spirit it is of Jesus, and especially of His resurrection, that we will bear witness. Another result of being filled with the Holy Spirit was that grace was upon all. "Grace" means favor. We are not told whether it was God's favor or man's favor that was upon them. It seems to imply both (See Luke 2:52). No man looked upon his own interests, but "every man on the things of others." Distribution was made according as each had need, not according to his ability, not according to his notable service. The pre-eminent illustration of Christian love in the brotherhood at Jerusalem was Barnabas. If we had more of such today we would have less of union labor troubles and missionary deficits. We do well to consider carefully the six distinguishing features of the early church: (1) A praying church (4:24-30), (2) a Spirit-filled church (31), (3) a united church (32), (4) a witnessing church (33). (5) a ministering church (34), 35), (6) a multiplying church (36, 37).

II. The Devil-Possessed Unbeliever, 5, 1-16. Barnabas had received great praise for what he had done at the impulse of the Holy Spirit in his life. It is an exceedingly fair picture, but the scene of the early church had been from foes without, now it faces the greater peril of foes within. And when this great question, regarding the deity and personality of the Holy Spirit, is first brought to light, God, through his church, dealt with it in a stern manner. The devil is always presenting his imitations of everything good and holy. Ananias and Sapphira were not willing to make a like sacrifice. They, too, "sold a possession," but they secreted a part of the price and brought the rest with the intent to deceive the church. The Holy Spirit quickly informed the church of this hypocrisy and, Spirit-guided, they were not deceived. For Ananias to lie in the atmosphere of love and consecration engendered by the Holy Spirit made his crime the more unpardonable. The same words are used in describing his actions as those used in describing the actions of Barnabas up to a certain point. But what a difference we see subsequently. In the case of Barnabas his act was a deed of self-forgetting love; in the case of Ananias it was one of calculating hypocrisy. We thus see that the early church was not as perfect as some would have us imagine it to be.

The second section of this paragraph (vv. 12-16) is a record of what the results of this vindication of the Holy Spirit were. First the Spirit came upon the apostles and literally overflowed upon all those about them.

In the second place those who were thinking of joining the church for mercenary motives were held back from so doing (v. 13).

If the Holy Spirit were present in such power today there would be fewer hypocrites who would dare to join themselves to it.

The deception of Ananias was deliberate (v. 4); he had talked it over with his wife (vv. 2, 9), and he was a grave danger to this early church. It threatened to choke the very fountain of love and unity which had sprung up in the midst of the selfish world.

The stern judgment that came upon Ananias and Sapphira was richly merited and indeed was gracious, for it sifted and saved the church.

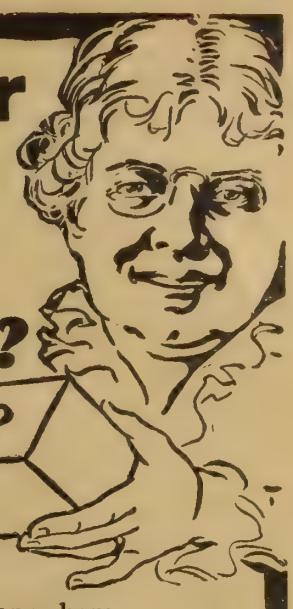
Your Mother Saved Money on Soap

Why Don't You?



Years ago, your grandmother made soap because she couldn't buy it. She taught your mother to make it and your mother can teach you because the important ingredient that your grandmother used is still for sale everywhere.

Lewis' Lye

The Standard for More Than Half a Century

The modern housewives do not appreciate how easily you can make clean, firm soap at home. Good lye is the secret. Lewis' Lye is good lye because it saponifies the grease perfectly and entirely. It makes just as good soap as you can buy—better than many—and it makes it cheaper. Get a can at your dealer's today and try it out at once. Lewis' is the lye you'll like for the many household uses.

OUR FASHION DEPARTMENT.

ALL PATTERNS, 10 Cents Each.

THIS department is prepared especially for The Wisconsin Farmer. We can supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10 cents each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering, all you have to do is to write your name and address plainly, tell us the correct number and size of each pattern you want and inclose 10 cents for each number. We agree to fill all orders promptly and guarantee safe delivery. Address all orders to The Wisconsin Farmer, Madison, Wis.

7250 Ladies' Waist.—Cut in sizes 34 to 48 inches bust measure. This simple, tailored waist has plain front and back. The neck may be finished with standing or flat collar and the sleeve may be long or short, with roll cuffs. Box plait or coat closing may be used.

7555 Girls' Dress.—Cut in sizes 6, 8, 10, 12 and 14 years. This dress consists of a separate blouse and skirt. The skirt is of plaid material and the blouse is of plain material. The skirt is cut in three gores.

7540 Girls' Apron.—Cut in sizes 2, 4, 6, 8, 10 and 12 years. Linen, gingham or calico can be used to make this serviceable apron. It closes at the back and can be made with either the plain or bishop sleeves. The collar and bands around the sleeves are finished with edging.

7547 Ladies' Waist.—Cut in sizes 34 to 44 inches bust measure. This waist may be made of either one or two materials. The closing is at the back and the sleeves may be long or short. The sleeve is finished with a pretty fancy cuff.

7571 Ladies' Skirt.—Cut in sizes 22 to 32 inches waist measure. Whipcord, velveteen, gabardine and broadcloth are liked for plain skirts like this one. The skirt is cut in five gores and has two small plaits at each side of the front. High or regulation waistline may be used.

7277 Children's Dress.—Cut in sizes 2, 4, 6 and 8 years. This simple frock has a plain blouse with wide sailor collar at the neck and long or short sleeves. The skirt is made with three gores and is slightly circular in cut. There is a wide belt where blouse and skirt are joined.

7559 Ladies' Dress.—Cut in sizes 34 to 42 inches bust measure. Serge, gabardine or broadcloth can be used to make this dress with the trimming and shield of contrasting material. The pattern provides for a shield. The skirt is cut in two gores and is joined to a yoke.

6865 Ladies' Apron.—Cut in sizes 34 to 44 inches bust measure. This is one of the favorite bungalow aprons, made with a small waist with sleeves and body cut in one, closing in the back and joined to a skirt which completely covers that of the dress.

7260 Children's Dress.—Cut in sizes 2, 4, 6, 8 and 10 years. This practical dress is suitable for either school or playtime. It has a simple sacque dress, closing at the side of the front and worn over bloomers which are mounted on a band and gathered at the knee.

7556 Ladies' Dress.—Cut in sizes 34 to 44 inches bust measure. This dress has a plain waist with side front closing and a separate shield and collar. The skirt is cut in two gores and is joined to a yoke. Long or short sleeves may be used.

Price of any of these patterns 10 cents each.

Taber Lined Silo.

THE Taber Lined silo is well known in the corn belt and has many claims worthy of the consideration of every farmer. The manufacturers claim that they are the only company turning out an absolutely clear long leaf pine silo. All lumber is thoroughly creosoted and boiled in creosote oil. This makes it non-shrinkable and acid proof. Owing to its being air tight there will be no frozen silage. We suggest our readers write the Taber Lumber Company, Dept. D, Keokuk, Iowa, for a copy of their new catalog which is just published.—Adv.

VETERINARY

PROFESSIONAL Veterinary advice through this department to regular subscribers only. We do not answer veterinary inquiries for the benefit of "neighbors." Parties desiring information will be required to send their names in full with their address. No question will be answered by mail unless accompanied by a fee of one dollar. In order that correct information may be given, the symptoms should be accurately described, stating of how long standing, together with color and age of animal, and what treatment, if any, has been resorted to. Thoroughly good and reliable veterinary remedies are advertised from time to time on these pages. If they were not good and reliable they could not appear in our paper. Our readers are requested to look them over. You may find here some remedy which will exactly fit your case. All veterinary inquiries should be addressed to this office.

AILING ANIMALS.

Age of Mule.

Do you tell the age of a mule by his teeth the same as a horse?

The dentition for the mule is supposed to take place at the same ages as for the horse, hence the same indications as to age would apply to each.

Warts.

I have a colt, two years old, that has several blood warts. Have tried everything, but nothing seems to help it. Have used carbolic acid. I would like to have your advice.

A nice method of treating warts is that of cutting them off clean and then cauterizing the wound. You may also get good results by applying the following paste to each wart. White arsenic and gum arabic, each one dram, and water to make six drams.

Cancer.

I have a mare with sore lips. It first started with a very small sore on the upper lip and kept eating until it got over both upper and lower lips. She is healthy and always calling for her feed, but she is falling off slightly in flesh. I work her when I need her. Her mate has a small touch of the same thing. It eats the lips quite deep. The mare has had it for three weeks. At times it seems dead and then again it is raw, with blood oozing out of the mouth. I keep no other horses in the barn for fear they will get the same thing. Slobbers run out of her mouth, as it seems she cannot work the lips to take in saliva. I have to shell her corn, as she cannot work her lips to get the ear right. What can I do for her and what is your advice?

It is very likely that the trouble with your horse's lips is of cancerous nature. This is not a very easy disease to overcome once it has a good start. The most rational and most effective treatment of this is the total cutting away of the affected parts just as soon as the trouble starts. But when a great amount of tissue becomes involved this becomes an impossibility. The best thing for you to do is to have a first-class veterinarian give these animals a thorough examination and advise you in accordance with the findings.

Wart Near the Eye.

I have a three-year-old horse that has a wart an inch and a half long above his eyelid. It is about an inch in diameter and has been there for four or five months. I have put castor oil on it, but it doesn't seem to help any. Can you tell me what to do for it?

In treating warts near the eye one must be careful not to injure the eye. In the case you mention try tying a strong cord tightly around the base of the wart, thus cutting off the blood supply and causing the wart to come off. The quickest and best method is to let a veterinarian remove it by means of the scalpel or scissors.

Windgalls.

I have a big mule with road puffs. What would be the best and safest remedy? I have tried several patent remedies without results.

The mule must have complete rest during treatment and for some time after. A sharp blister with biniodide of mercury will promote absorption of the excess secretion, should subdue the inflammation, strengthen the walls of the sac and finally cause the windall to disappear. In case the blistering does not bring about the desired after results after a few applications may be necessary to resort to line firing or other surgical operation.

BEST INSECTICIDE.

With many fruit growers, especially the professional fruit men (the term used advisedly and means the men who do nothing else but fruit growing) spraying has become a regular part of the summer program. Experience has gone so far at this time that the lessons learned by actual work have such value. Thirty years since it was thought that Paris green was the only suitable poison to mix with the fungicide, Bordeaux mixture. Doubtless Paris green would still be used if we could not do better. But there are found to be points of advantage in the use of arsenate of lead. For one thing, it remains in suspension in the spray mixture far better than the green, does not require that constant agitation necessary for the former.

For another thing, the arsenate is sticky in its nature and when once lodged on the little apple, where it is put to foil the worm in its efforts to enter, it stays there for an indefinite time. It will not deteriorate in the sun, and rain is not likely to wash it off. But it stays put, until Mr. Worm appears and gobbles it. It combines as well with the newer fungicide, lime-sulphur, as it does with the Bordeaux.

For some years lead arsenate was always bought in the paste form and when used required to be thinned with a small portion of water and well mixed before adding to the contents of the spray tank. Now it is offered by the druggist in the form of a dry powder. In this form it is easier to use and is just as strong and effective as the paste. About the same quantity is needed to add to the fungicide.

The way to use the powder is to mix first with a little water and then add the thinned dose to the contents of the barrel. The improvements made all tend to make the necessary work of spraying a little easier and that encourages the effort.

KANSAS MAN WINS PRIZE.

F. E. Slason, of Plainville, Kan., was awarded the first prize of $500 by the Hyatt Roller Bearing Company in the contest to determine the greatest mileage attained by automobiles on their original equipments of Hyatt bearings. Slason's car, a 1909 model, had traveled 261,000 miles—equal to more than ten times around the world—up to last October when the contest closed, and since then thousands of miles more have been added to this record.

The second prize was awarded to James Lewis, of Shelton, Conn., whose 1909 Mitchell had traveled 218,734 miles when the contest closed.

Seven different makes of cars are represented among the sixteen prize winners, the total distance traveled being 2,512,435 miles—equal to more than 100 times around the world. The average mileage of all sixteen prize winners was 156,814, or more than six times around the world. All of the cars are being operated by their owners today.

The Hyatt bearings in all the cars never gave the slightest trouble. All the mileages were investigated and substantiated and were submitted to the judges with the evidence. The judges were: Alfred Reeves, general manager of the Automobile Chamber of Commerce; Coker F. Clarkson, general manager of the Society of Automobile Engineers, and Julian Chase, editor of "Horseless Age."

The other prize winners follow; J. W. Norman, Paint Rock, Texas, 1909 Mitchell, 183,837 miles; Sam Deck, Darlington, Ind., 1910 Mitchell, 175,875 miles; J. D. Albright, Bowie, Texas, 1911 Ford, 172,683 miles; Earl G. Druding, Ellsworth, Wis., 1909 Ford, 171,418 miles; S. T. & E. R. R., Stockton, Cal., 1909 Mitchell, 160,100 miles; Jacob Stark, Chicago, Ill., 1906 Logan, 148,150 miles; J. J. Moore, Philadelphia, Pa., 1911 Ford, 147,751 miles; John Fraser, Jr., Milwaukee, Wis., 1908 Buick, 139,523 miles; George P. Mason, Des Moines, Iowa, 1910 Maytag, 135,000. Dr. P. M. Bertolet, Reading, Pa., 1910 Mitchell, 127,681 miles; James W. Hines, Minneapolis, Minn., 1910 Hudson, 120,256 Linus Krene, Buffalo, N. Y., 1910 Mitchell, 120,000 miles; J. N. Burnett, Dallas, Texas, 1909 Flanders, 116,557 miles; F. I. Wiltse, Oneonta, N. Y., 1908 Ford, 113,061 miles.

ST. LOUIS A WORLD FUR MARKET.

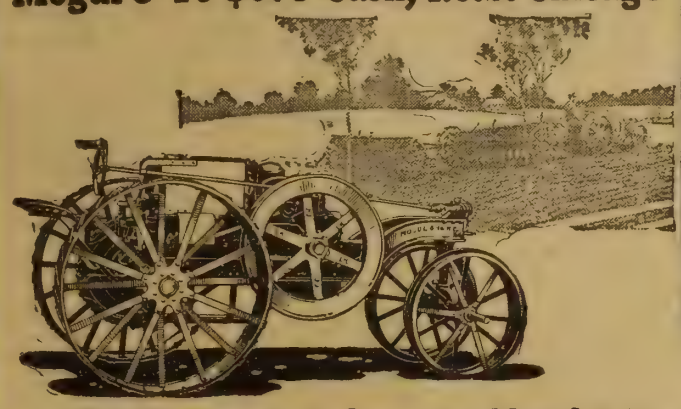
The million dollar fur sale which began in St. Louis, Missouri, January 13th last, emphasizes emphatically the change of the fur market from London to American cities. Great fur traders, who have much to do with controlling the world's trade met at this sale conducted at the Funsten Fur Exchange. Large fur houses of Europe were present, practically all of them, as well as the fur buyers of Canada and the United States. The bidding was spirited.

The scene on the exchange floor was not unlike a legislative chamber. Each of the 300 expert buyers sat behind his own desk facing the elevated courtlike bench of the auctioneer. Pages and messenger boys scurried about. The selling was rapid—and exciting. A bid of a dollar might actually be a bid of a thousand if the lot chanced to be one in which there were a thousand pelts. In the same way a 10-cent raise might easily mean a cool hundred dollars. Yet the buyers, seasoned veterans, took all the excitement calmly enough, though the sale of a single pair of silver fox skins for $2,350 did bring a ripple of applause. For such skins to bring $1,820 and $1,900 was a mere nothing. The furs of fifteen different countries were represented, at all kinds of prices—from 6 cents upward. The prices for the fur of common blue and black house cats went up as high as 46 cents each, and the demand was lively. On the whole, the prices commanded were high, in some cases showing an advance of 30 per cent over last year. Domestic skins from American trappers were much in evidence.

Among the buyers present were experts representing Goetz Freres, Paris; J. Arionwitch & Co., Moscow; The Eitingon Schild Co., another Russian concern; G. Gaudig & Blum, Theo. Thorer, Inc., Otto Erler and H. Jaeckel Sons, all German fur companies; H. M. Koenigswerther, of Leipsic; The T. Eaton Co., of Winnipeg, and many others.

This great sale, which will be the first of many, represents a distinct triumph for Funsten Bros. & Co.

Buy It Now and Save the Feed
Mogul 8-16 $675 Cash, f.o.b. Chicago



IT will pay you to buy your Mogul 8-16 now. Judging from our experience, the works will have difficulty in filling the demand for these tractors for spring work. If you order yours now, you will have it when you need it, and the tractor will not cost you a cent for up-keep until you begin to use it.

Besides, there probably will never be a better market for good farm horses than there is this winter. **Buy a Mogul 8-16 now.** Sell your horses in this good market and sell the feed they would consume while standing idle this winter.

Mogul 8-16 is the one light tractor that burns cheap oil fuel—kerosene, benzine, naphtha, and other low-grade distillates—successfully. It costs only **$675 cash, f. o. b. Chicago.** Your local dealer has a sample machine that you can see and study, and he can probably refer you to many farmers who know that the **Mogul 8-16** does, better and cheaper, the heavy work of the farm for which you are now using horses. If he cannot, write us. We can. We will also send you our 100-page tractor book, "Farm Power," which tells fairly why you should own and use a modern **Mogul 8-16** light tractor. Don't delay. Buy it now.

PRICES DOWN AGAIN!

GALLOWAY SANITARY CREAM SEPARATORS
~~425.00~~ ~~51.00~~ ~~63.50~~

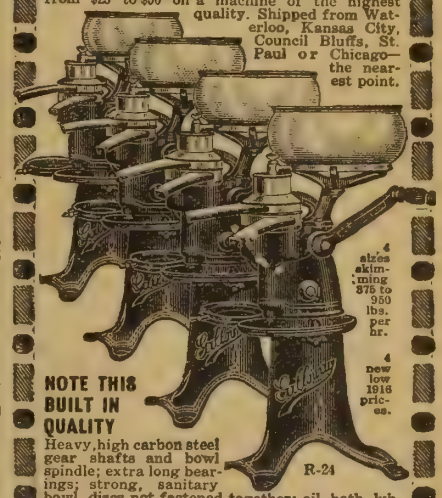
are lower priced than ever and the quality has been maintained throughout. In spite of the increased cost of all materials, on account of the large volume going through my factories, I am able to again cut and slash cream separator prices. The 1915 prices are not in force any more. My new low 1916 prices and new easy selling plans, such as no money down—a year to pay, etc., have taken their place. 10,000 separators now coming through my factories—all to be sold on **special proposition between now and grass.**

In addition to the famous line of separators I have been building I have added a new size which I am selling for less money than ever before. It is identical in quality and design with the other sizes, and fully described in my

1916 BOOK—NOW READY!

250 PAGES—If you buy a separator in the next twelve months you should have this book. It tells how I build the Galloway Sanitary Bath-in-Oil Cream Separators from the ground up. Read this book before you buy a cream separator of any make at any price!

Don't be misled on cream separators thrown together and sold for a price. Buy direct from a real factory, get a better machine and save from $25 to $50 on a machine of the highest quality. Shipped from Waterloo, Kansas City, Council Bluffs, St. Paul or Chicago—the nearest point.



NOTE THIS BUILT IN QUALITY

Heavy, high carbon steel gear shafts and bowl spindle; extra long bearings; strong, sanitary bowl, discs not fastened together; oil bath lubrication; big, roomy, seamless, pressed steel supply tank; both gear shafts and both spindle bearings supported by one solid casting; heavy sanitary tinware; low bowl speed reduces wear on bearings and gears. No raw, sharp edges in the bowl to break up the globules of butter fat. Drop us a postal today.

NEWS OF THE SALE RING

J. C. Hendricks' Poland Sale.

One of the big surprises in the live stock world was the sale of J. C. Hendricks, Hazel Green, Wis. Owing to the corn crop failure and other unfavorable conditions that have prevailed to hurt the swine game, and basing their opinions on the average obtained at Duroc and Poland sales held earlier in the season, it was universally predicted that we would not see any very high averages on the entire sale circuit. Moreover Mr. Hendricks has not done any showing in the past few years and did not have the advantage of pull which grand championships and show records give a sale. However, the average obtained was $75.30 on the sows, which represented the price that the majority of the animals brought. There were no extravagant prices paid and no low prices, the top sow selling at $135. This was a two-year-old sow, weighing close to 600 pounds. The top priced spring gilt was $125, weighing close to 440 pounds, a remarkable growth for an eleven-month-old gilt in good breeding condition. These two top priced animals went to North Bend, Wis., to J. D. McDonald and W. W. Quackenburk, Melrose, Wis., respectively. The bidding was snappy from the start and practically every animal started at $50 and above. Practically all of the leading big-type breeders in Wisconsin and northern Illinois were present and there was hot competition between them. The offering was very uniform in type, development and quality, which is a credit to Mr. Hendricks' ability as a breeder. The breeders present, although anxious to buy these animals as low as possible, made statements of praise and commendation during the sale that stimulated the bidding and gave the newer buyers greater confidence in their own judgment. Sows were sold to buyers in all sections from Wisconsin, as well as Illinois and Iowa. The following is a detailed list of the sale:

1.	J. D. McDonald, North Bend, Wis.	$135.00
2.	Ben Feldermon, Bellview, Ill.	90.00
3.	Fred Suter, Fountain City, Wis.	70.00
4.	Heck Bros., Burlington, Wis.	82.50
5.	Geo. Lesh, Lyons, Wis.	75.00
6.	L. E. Pease, Millville, Wis.	70.00
7.	W. L. Proctor, Barlington, Wis.	80.00
8.	Ed Hendricks, Hazel Green, Wis.	80.00
9.	Columbia County Asylum, Wyocena, Wis.	55.00
10.	Ben Feldermon	70.00
11.	W. W. Quackenburk, Melrose, Wis.	125.00
12.	L. E. Pease	77.50
13.	Geo. Martin, Darlington, Wis.	70.00
14.	J. D. McDonald	80.00
16.	P. T. Rambow, Decorah, Ia.	62.50
17.	A. Bergum, De Forest, Wis.	60.00
18.	Jas. Daws, Galena, Ill.	57.50
19.	E. W. Hendricks, Hazel Green, Wis.	100.00
20.	L. P. Martiny, Chippewa Falls, Wis.	65.00
21.	Dobson & Eastman, Lancaster, Wis.	72.50
22.	W. H. Brunker, Ridegway, Wis.	77.50
23.	W. L. Proctor	67.50
24.	Lathrop & Sons, Wauzeka, Wis.	67.50
25.	Frank Moorhouse, Lancaster, Wis.	80.00
26.	Jno. Adickes, Platteville, Wis.	77.50
27.	Heck Bros.	72.50
28.	Heck Bros.	57.50
29.	W. H. Brunker	80.00
30.	Griswold Bros., Livingston, Wis.	65.00
31.	E. W. Hendricks	75.00
32.	W. W. Quackenburk	77.50
33.	Ben Feldermon	57.50
34.	C. H. Whitmore, Evansville, Wis.	70.00
35.	W. L. Proctor	42.50

41.	Henry Drafahl, Janesville, Wis.	52.00
42.	J. D. McDonald	105.00

Smiley's Poland China Sale.

The first sale on the Southern Wisconsin Poland China Sale Circuit was that of Wm. Smiley & Son, Albany, Wis. There was a goodly sized crowd present and for a time bidding was snappy. However, the crowd realized that there would be a chance to buy about 200 Poland China sows within the next four days and,though bidding was brisk, they did not start high. Owing to unfavorable conditions last spring these gilts did not get a promising start and because of this they were hardly up to the usual Smiley standard. The bulk of the offering was of late spring farrow, as many of their early pigs were affected by the unseasonably wet weather last March and April. A large part of the offering stayed in the home county, which is evidence of the esteem with which the neighbors regard Mr. Smiley and the quality of his swine. There were no exceptionally high prices paid and no very low prices, the price being very uniform. There were a number in the sale bred by other breeders which, though of good quality did not carry as good a finish and, therefore, did not bring what they were worth. Col. Ira Cottingham conducted the sale and impressed the buyers by his clean, sincere, honorable methods. Wisconsin breeders and buyers are fortunate to hold or attend a sale cried by such an auctioneer and we hope he will be with us often in the future. Below is a detailed list of the sale:

1.	C. A. McCornuck, Mechanicsville, Ia.	$42.50
2.	E. B. Eastwood, South Wayne, Wis.	42.50
3.	A. W. Cole, Lodi, Wis.	50.00
4.	J. D. McDermott, Albany, Wis.	40.00
5.	J. D. McDermott	47.50
6.	Fred Buckner, Spring Green, Wis.	37.50
7.	J. D. McDermott	37.50
8.	W. J. Yager, Lena, Ill.	32.50
9.	Grant Walrath, Edgerton, Wis.	35.00
10.	Frank Schultz, Brodhead, Wis.	37.50
11.	J. McDermott	40.00
12.	Columbia County Asylum, Wyocena, Wis.	32.50
13.	F. P. Jeffery, Monroe, Wis.	32.50
15.	J. McDermott	42.50
17.	Wm. Towne, Albany, Wis.	85.00
19.	E. B. Eastwood	32.50
21.	C. E. Young, Brodhead, Wis.	35.00

41.	Otto Baars	30.00
42.	D. Finnane	30.00
44.	J. McDermott	32.50
45.	W. G. Vance, Lima Center, Wis.	32.50
48.	Lee Gillett, Albany Wis.	35.00
49.	D. Finnane	35.00
46.	C. H. Whitemore	55.00
47.	Caverly, Toulon, Ill.	52.50
50.	Lee Gillett	37.50
51.	C. S. Maltby, Janesville, Wis.	42.50
52.	C. S. Maltby	45.00
55.	E. B. Eastwood	45.00

E. W. Hendricks' Poland Sale.

The third sale on the Southern Wisconsin Poland China Sale Circuit was that of E. W. Hendricks, Hazel Green, Wis., Thursday, February 10th. It demonstrated that there is always a demand for the best in live stock. Although there had already been close to 100 Poland China sows sold in two days, the demand seemed to be as great as ever and bidding was brisk right up to the last animal. The offering was good from every standpoint, viz: breeding, development and type. Although not carrying quite the size and finish as a whole as those sold the day before, yet they were above the average seen in most public sales. The top priced gilts were a fall yearling and a spring gilt that sold for $137.50 each. The boar, Black Jumbo, was the object of much interest, as he is one of the few 1,100-pound boars in the breed. Although only three years old he has attained this remarkable size, yet is smooth with eleven-inch bone and active on his feet. His daughters and sows bred to him were bid on very liberally. All sections of Wisconsin were represented on the sale seats, which is another indication of the interest that has so rapidly developed in Wisconsin. Northern Illinois, Iowa and Indiana buyers also purchased several head. This good seed stock should prove of much value to the buyer, if properly taken care of. The crowd was royally entertained with a dinner served by Mrs. Hendricks and her obliging friends and it was thoroughly enjoyed and appreciated by everyone present. A detailed list of the sale is given below:

1.	A. E. Hensley, Cappa, Ind.	$115.00
2.	J. D. McDonald, North Bend, Wis.	137.50
3.	L. E. Pease, Millville, Wis.	70.00
4.	Mr. Sutter, Fountain City, Wis.	85.00
6.	Geo. Madden, Fox Lake, Wis.	72.50
7.	John Crook, Dodgeville, Wis.	70.00
8.	Tony Rosenmeyer, Cuba City, Wis.	72.50
9.	E. Caverly, Toulon, Ill.	102.50
11.	John Belcher, Ramora, Mo.	90.00
12.	J. C. Hendricks, Hazel Green, Wis.	137.50
14.	Chas. Greenwald, East Dubuque, Ill.	85.00
15.	James Denvan, Fox Lake, Wis.	80.00
16.	W. H. Maxwell, Dixon, Ill.	62.50
17.	F. J. Sweeny, North Buena Vista, Ill.	65.00
18.	Geo. Van Matre, Orangeville, Ill.	77.50
19.	B. J. Stevenson, Raymond, Ia.	65.00
20.	Geo. Martin, Darlington, Wis.	80.00
21.	J. C. Hendricks	65.00
22.	Columbia County Asylum, Wyocena, Wis.	62.50
23.	John Clayton, Belmont, Wis.	52.50
24.	Edgar Martin, Winchester, Ind.	70.00
25.	W. H. Maxwell, Winchester, Ind.	57.50
26.	W. J. Yager, Lena, Ill.	67.50
27.	C. S. Maltby, Janesville, Wis.	50.00
29.	B. L. Shunkweiler, Raub, Ind.	47.50
30.	J. Crook	47.50
31.	F. J. Showers, Orangeville, Ill.	47.50
32.	Jos. Huntington, Darlington, Wis.	47.50
33.	H. O. Adams, Fredericksburg, Iowa	47.50
34.	Geo. Madden, Fax Lake, Wis.	50.00
35.	T. A. Carkill, Nortonville, Kan.	45.00
36.	F. E. Purdy, Orfordville Wis.	47.50
37.	W. J. Yager	50.00
38.	H. O. Adams	45.00
39.	S. H. Whitmore, Evansville, Wis.	52.50
40.	James Trewartha, Hazel Green, Wis.	50.00
41.	W. J. Yager	57.50

Madson's Poland China Sale.

Mace Madson & Sons, Madison, Wis., sold thirty-eight bred sows at public sale at an average of $41.30. Although not a high average, many breeders in the state would consider themselves very fortunate indeed to be able to obtain this average on their sales this year. However, the prices were not in keeping with the quality of the offering, but being the last sale in the circuit the breeders were pretty well supplied, especially as these will be kept largely on boughten feed that costs "real" money at the present time. There was an extraordinarily large crowd of breeders and farmers. The offering was in good flesh, but not overfat. They combined good size with quality, but were not as large as many of the big-type herds. Among the heavy bidders were J. I. Ethredge, Madison, Wis., who bought for the Oconto Farms, Oconto Falls, Wis.; Frank Spencer, Appleton, Wis.; Senator Bichler, Random Lake, Wis., and several others. A detailed report is given below:

1.	J. P. Martiny, Chippewa Falls, Wis.	$57.50
2.	Paul Renner, Appleton, Wis.	47.50
3.	W. B. Noyes, Beaver Dam, Wis.	40.00
4.	M. Palmer, Neillsville, Wis.	50.00
5.	Senator Bichler, Random Lake, Wis.	50.00
7.	B. McNulty, Cobb, Wis.	50.00
8.	B. Hefty, Riley, Wis.	50.00
9.	L. M. Stusse, Riley, Wis.	47.50
10.	Frank Spencer, Jr., Appleton, Wis.	55.00
11.	R. L. Perryl, Spencer, Wis.	45.00
12.	C. Nelson, Edgerton, Wis.	35.00
13.	John Slater, Madison, Wis.	37.50
14.	J. I. Etheridge, Madison, Wis.	37.50
15.	John Slater	37.50
16.	J. I. Etheridge	47.50
17.	C. B. Rutherford, Lake Mills, Wis.	32.75
18.	Mr. McNulty	37.50
19.	A. Getzgo, Madison, Wis.	30.00
20.	Senator Bichler	35.00
21.	J. D. Little, Janesville, Wis.	35.00
22.	S. Good, Madison, Wis.	40.00
23.	W. H. Carey, Argyle, Wis.	47.50
24.	J. I. Etheridge	50.00
26.	E. Padden, Mortonville, Wis.	32.50
27.	F. E. Hayner, Sun Prairie, Wis.	32.50
28.	F. E. Hayner	32.50
30.	Elmer Renner, Appleton, Wis.	32.50
31.	Elmer Renner	40.00

OZAUKEE COUNTY BREEDERS.

The Ozaukee County Holstein-Friesian Breeders' Association will hold its annual meeting at Cedarburg, Wisconsin, February 24th. This association has over fifty members and expects to increase its membership materially at the coming meeting. Many farmers have purchased pure breds the past year. C. F. Dineen is secretary of the association.

Live Stock Items and Commercial Notes

Gathered by Representatives of The Wisconsin Farmer

Shekletons' Stallions.

UNDER date of February 7th, Frank P. Shekleton & Sons, Lawler, Iowa, write as follows: "Last week was a very stormy week here, but in spite of that stallion buyers came in on nearly every train, and we made quite a number of satisfactory sales, which shows that buyers find what they want and at the right prices when they come to our barns. Among our sales for the past week are the following: G. F. Overholt, Manley, Iowa, is a breeder of Percherons and was looking for a stallion to head his herd of pure-bred mares. Mr. Overholt is a discriminating buyer and would buy nothing but the best, having been in the market for a stallion for a year and, finding nothing that would suit him, he visited our barns and after looking over our two-year-old stud colts he selected the large, massive black Percheron colt, Dalton. Mr. Overholt said he was the best Percheron colt he has seen in years and he has every reason to be proud of his purchase, as this colt is a grandson of Besique, and with the breeding and conformation that he possesses should make a great sire. V. Moline selected the 2,200-pound Percheron stallion, Lester. Mr. Moline lives in the northern part of South Dakota and wanted a horse with great scale and conformation to put on his ranch. Lester is a tried sire and should make good in his western home. W. C. Danner, New Hampton, Iowa, selected the rising five-year-old gray Percheron, King George. This horse now weighs a trifle over 2,100 pounds and has very heavy bone. Mr. Danner has a good herd of grade Percheron mares and wanted a heavy-boned stallion for his own use. To L. A. Schaefer, Parker, S. D., we sold the imported black Percheron stallion, Pickard. Mr. Schaefer is a breeder of Percheron horses and has a bunch of young pure-bred mares to breed this spring. John Schaler, St. Paul, Minn., selected the imported bay Belgian stallion, Mas A. Mons. This horse weighed a trifle over 2,300 pounds when Mr. Schaler bought him and cost him a lot of money, but Mr. Schaler has a lot of grade Belgian mares and will make this horse noted as a great sire. To Frank Kodako, Cloverdale, N. D., goes the thick-set roan Belgian stallion, Romeo. Mr. Kodako has a small herd of mares and selected this colt on account of his thick, heavy-set build. We have a very choice bunch of imported and American-bred stallions of the ton and over type, and will be able to suit anyone, whether they want the very best or a good stallion to put on the stand. Parties desirous of buying stallions this spring will save money by writing to us and getting our prices and descriptions before they buy." When writing mention this paper. See the advertisement on page 45.—Adv.

Currie's Hampshire Swine Sale.

THE Hampshire swine sale of R. L. Currie, Viola, Wis., to be held Wednesday, February 23d, is one which our Hampshire readers should not fail to attend. This is one of the oldest established herds in the state of Wisconsin and one of the best. Mr. Currie has bred and owned many of the highest priced Hampshires ever sold in the state and Illinois and Iowa buyers have purchased from him very heavily. The offering in this sale consists of 100 head. This includes his worthy mature matrons as well as their promising yearlings and younger offspring. There are twenty of these big foundation sows, forty extra good spring gilts and the balance fall yearlings and 1915 fall pigs. The yearling and older sows are daughters of such boars as Aristocrat Jr., a grandson of the Illinois grand champion boar, Bon Ton, King Midas by Viola Chief, Orchard Hill Duke Jr., an outstanding boar sired by Orchard Hill Duke. The sows are bred for spring litters to De Kalb's General McArthur, one of the best bred sires living, being a son of Erlanger and out of Jennie Aylor. The sows not bred to De Kalb's General McArthur are bred to Currie's Champion and Currie's King. Plan to attend this sale or send a mail bid to the auctioneer, Chas. W. O'Neill, Bridgeport, Wis., or H. S. Hoard, representative of The Wisconsin Farmer. See page 44.—Adv.

Haigh's Percheron Dispersion.

THE entire Percheron stud of John H. Haigh, Pickett, Wis., will be sold at public auction March 1, 1916. The sale will be held at Omro, Wis. An interesting catalog showing breeding and giving description has been issued and will be sent on request. Mr. Haigh has been one of the leading Percheron breeders in central Wisconsin and has bred and owned many very valuable horses. He recently sold his farm and is, therefore, dispersing his herd. Write for catalog and look it over. When writing kindly mention The Wisconsin Farmer. See page 45. —Adv.

Valuable Free Book.

EVERY farmer who owns an engine or expects to buy one ought to know about engines—how to judge them, how to apply simple tests, how to figure exactly what an engine is worth. This interesting and valuable information is given in the free illustrated book, which will be sent without any obligations to any reader. Simply send name today to E. H. Witte, 2716 Oakland, Ave., Kansas City, Mo., and mention their advertisement on page 28.—Adv.

Valuable Farm Building Books.

THE Gordon-Van Tine Lumber Company of Davenport is offering in their advertisement on page 48 to send every reader of this paper, free, two books containing 300 modern house plans, showing photographs, color schemes, floor plans and all architectural details. It is said that it cost $10,000 to prepare each of these books and it is certain that they will prove of great value and interest to every reader who is considering building a new home. They are also offering free a big barn book, showing the most approved plans and methods of barn construction. In their advertisement are shown pictures of some of these various plans, together with other construction materials of interest to every farmer. The Gordon-Van Tine Company is one of the oldest lumber concerns in Iowa. For over half a century they have given satisfactory service to thousands of customers and boast a list of over 100,000 satisfied patrons. Their building materials, ready-cut houses, barns, adjustable wall silos, etc., are all sold on a strong "satisfaction or money back" guarantee. All that it is necessary to do in order to get the valuable plan books, catalogs, roofing samples, etc., mentioned in their advertisement, is to fill out the attached coupon and mail it to Gordon-Van Tine Co., 5935 Case St., Davenport, Iowa, mentioning this paper and what things you are especially interested in.—Adv.

The Short-horn in America.

AN announcement of special interest to all Short-horn adherents appears on page 44. The American Short-horn Breeders' Association has planned to render a broad service to the Short-horn interests at large. "The Short-horn in America," which will be published as a quarterly, beginning April 1st, is an important part in this plan. The publication will be under the direct charge of Frank D. Tomson, for many years connected with the agricultural press. It is not intended that "The Short-horn in America" will be an advertising medium except that it will carry a breeders' directory as explained in the announcement. Hundreds of inquiries for Short-horns are received each year at the association office and it is desired that this breeders' directory will be sufficiently representative that it may be supplied to all such inquiries and furnish the information needed. This publication will become a reliable record of Short-horn progress. It will contain expressions from representative Short-horn authorities. It will, in fact, become the exponent of Short-horn affairs throughout the land. The association invites the co-operation of every breeder and prospective breeder of Short-horns. The plan has far-reaching possibilities.—Adv.

McDonald's Poland Chinas.

ONE of the greatest Poland China herds in Wisconsin is that of J. D. McDonald, North Bend, Wis. They are not only well bred, carrying the blood of the most noted animals of the breed, but by the records made at the leading fairs in the Northwest they have proven themselves to be animals of great individual merit. Mr. McDonald has a herd of close to 200 animals and his show herd has won heavily at the Northern Wisconsin State Fair, Minnesota State Fair and Wisconsin State Fair. His matured sows are big and prolific, weighing as high as 800 pounds. His boars are big with heavy bone and of smooth quality. His spring pigs are well grown, of good type and willl develop into good individuals. He is now offering bred sows and gilts that with proper care will prove very profitable.—Adv.

155-Egg Progressive Incubators for $7.85.

SOME of the many phenomenal hatches that have been obtained by using Progressive incubators are shown in the form of testimonial statements from users on the Progressive incubator advertisement on page 20. Records like these are not an accident—they are the result of years of careful planning and the working out of details by the makers and then by employing high quality workmanship and materials in their construction. The price is as low as the quality is high, their big 155-egg incubator selling for only $7.85. The many special features of the Progressive are shown in their advertisement. You can get more information regarding them and receive their new 1916 combination offer without obligation on your part by writing to Progressive Incubator Co., Box 128, Racine, Wis., and mentioning this paper.—Adv.

Karo Adds to the Joy of Living.

HOUSEWIVES of the United States have awakened to the fact that Karo corn sirup, introduced some years ago, is not a passing fad, but a staple food product that has come to stay and to grow in popularity. In thousands of farm homes all over the country it has become as staple as granulated sugar. The Corn Products Refining Company announce that during the past year 65,000,000 pails of this food have been sold, and the demand is increasing steadily. To realize the full satisfaction of the breakfast hour, when the wind is blowing crisp and keen across miles of open snow fields and the mercury is trying to sneak through the bottom of the thermometer, one needs to have a plate of steaming hot griddle cakes, just off the fire, with a pitcher of Karo sirup handy. As a special inducement to housekeepers the makers of Karo sirup are offering a fine aluminum griddle at less than half its usutl price when the order is accompanied by 50 cents' worth of Karo labels. It makes better cakes than "the kind mother used to make" on the old-fashioned iron griddle that stood under the kitchen sink and smoked and burned and it's lots easier kept clean. If you havn't tasted griddle cakes made on a Karo aluminum griddle and smothered in Karo sirup give thanks that you have something yet to live for.—Adv.

Knudson's Durocs and Guernseys.

DAUGHTERS of Valley G. are advertised for sale on page 47 by Allic S. Knudson, Brodhead, Wis. Valley G. is one of the best Duroc boars in the Northwest. He is great by virtue of his breeding, by virtue of his good individual merit and by virtue of his offspring. He is a litter brother of the noted boar, Illustrator, that was grand champion at the Illinois State Fair and sold for $2,000. As an individual he is one of the best to be found. Although he weighs over 1,000 pounds and has eleven-inch bone, he is not coarse and full of wrinkles. He has a short, wide head, a long, smooth, strong back, deep sides and thick, well-let-down hams, He transmits to his sons and daughters his great size and his refined quality and they develop rapidly into high-class animals. The gilts which are advertised for sale are bred to Colonel Defender and Crimson Again. Mr. Knudson is also a breeder of registered Guernsey cattle and is offering some excellent young bulls of May Rose, Glenwood and Rilma breeding. A number of these are from advanced registry dams of choice breeding. For pedigrees and further information write to the above address.—Adv.

50,000 Butterfly Separators in Use.

WHEN a cream separator has been used on more than 50,000 farms and found so satisfactory that its users are enthusiastic over it there is no room for doubt that it is designed along right lines, carefully built and efficient in use. This is the case with the New Butterfly, shown in the Albaugh-Dover Co.'s advertisement on page 19. One of the most attractive things about their offer on this machine is that you can get one on thirty days' trial and, if not satisfied with it, can return it at the maker's expense, which includes freight charges both ways. If you want to keep it you can pay for it at the rate of only $2 a month, without interest and without any extras, letting it earn its own way in extra profits. You can read and see its many special features set out in the advertisement and can then get a free catalog and details of their special offer by filling out the attached coupon and mailing it to Albaugh-Dover Co., 2158 Marshall Blvd., Chicago, Ill. Please mention this paper when doing so.—Adv.

Harmony Stock Farm Short-horns.

TEN very good Scotch Short-horn bulls are advertised for sale on page 47 by J. E. Kennedy, Janesville, Wis. These were sired by Strathallen King 296426, one of the best grandsons of the noted bull, Whitehall Sultan. His sire sold for $5,000 and his dam sold twice for $950. For pedigrees and further information in regard to these animals write to the above address.—Adv.

Easy Terms on Edison Phonographs.

YOU can get one of the new Edison phonographs, with your choice of records, on trial and if not satisfied can return them, or if you desire to keep this wonderful home entertainer you can pay for it at the rate of only $1 down and the balance at the rate of a few cents a day. If you have not seen the new Edison book you can get one without any obligation on your part by addressing F. K. Babson, 4482 Edison Block, Chicago, Ill., and mentioning the advertisement on page 38. —Adv.

Lybrand's Percheron Dispersion.

THE Lybrand Percheron Stud, Richland Center, Wis., will be dispersed at public sale, Monday, February 21st. This is one of the largest and best lot of Percherons in southern Wisconsin. The mares are a lot of big, level, drafty producers that are regular breeders. For many years this stud has been the mecca for big breeders to replenish their stock of young breeding stock. The character of the stallions and mares used has attracted buyers from all parts of the middle West. Owing to the recent death of Mr. Lybrand the herd will now be discontinued and the entire herd of sound, drafty mares, as well as the promising young mares and stallions will be sold out. The black stallion, Tripoli 27449 (46168), an imported horse of tried and proven worth wiill be sold as well as seven of his sons, four yearlings and three weanlings. The female offering consists of fifteen tried and proven mares, three two year olds and eight weanlings. Tripoli sired the younger females and they have all inherited his rich black color. Catalogs giving pedigrees and description have been issued and are ready for distribution. Send for one at once to Mrs. R. C. Lybrand, Richland Center or J. W. Martin, Gotham, Wis. —Adv.

Short-horn Calf Futurity.

THE American Short-horn Breeders' Association has made a total appropriation of $7,000 for the calf futurity classes for 1916 at the Iowa State Fair, Des Moines; Ohio State Fair, Columbus; American Royal, Kansas City, and The International, Chicago; a liberal appropriation and one that should meet with a general response by Short-horn breeders. Entries for senior calves close March 1st; junior entries close June 1st, with no privilege to substitute after entry is made. The limiting of this privilege is directly in favor of the small breeder. If the privilege to substitute were extended to a later date the advantage would clearly rest with the larger breeders and exhibitors who are apt to have a greater range of selection. Entries should be sent to the association office, 13 Dexter Park avenue, Chicago, Ill. The general appropriation for shows and fairs for the year, made by the Short-horn Association, show a large increase and are widely distributed. Detailed information will be available at an early date. It is a broad plan that the association has worked out, and a popular one with the many interested fair associations and exhibitors.—Adv.

Lefebure's Belgians.

HENRY LEFEBURE & SONS, Fairfax, Iowa, write as follows: "On Tuesday, February 1st, Dave Risk, the live stock artist of Chicago, visited the Lefebure Stock Farms at Fairfax, Iowa, and upon seeing the twenty largest Belgian stallions, photographed twelve in a group and then weighed them, finding the average weight of the twelve to be 2,174 pounds. The photograph of this group of twelve will be seen in the agricultural journals in the very near future and we believe this the best and heaviest group of Belgian stallions in America. The twenty weigh twenty tons, are from two to six years old, sound and right in every way. Five of these were the first-prize group of the Iowa State Fair, Minnesota State Fair and the Panama-Pacific Exposition this year. We are enjoying a nice trade, one of the recent sales being a pair of fillies to Arthur Smith, of Sycamore, Ill., and a two-year-old stallion to a club of farmers at Cartwright, N. D." See page 45 and when writing for prices or information kindly mention this paper.—Adv.

Taking the Labor Out of Plowing.

THE secret of plowing lies in the shape of the plow, which enables it either to follow along the lines of least resistance or else requires extra pulling power because it is not properly designed. Janesville plows are the result of the most careful study and experience in making a twist moldboard that cuts neatly, lays over a clean furrow, and requires a minimum of pulling power. Their booklet, offered free in their advertisement on page 27 tells how to reduce the labor of plowing greatly, while doing a thorough job. You can get it by writing to Janesville Machine Co., 41 Center St., Janesville, Wis., and mentioning their advertisement in this paper. At the same time it will pay you to inquire regarding their other kinds of high-grade farm implements and machinery.—Adv.

Burn Brae Farm Durocs.

THE Burn Brae Farm, Rosendale, Wis., owned by Chas. A. Peterson, is advertising Duroc spring gilts. These gilts were sired by Burn Brae Distinction and Hazelhurst Colonel. Burn Brae Distinction is a son of the noted boar,

NEXT WEEK'S SALE PROGRAM

Monday, February 21 — Percherons, J. W. Martin, Mgr., Richland Center, Wis.

Wednesday, February 23 — Hampshires, R. L. Currie, Viola, Wis.

CURRIE'S HAMPSHIRE SWINE SALE

WEDNESDAY, FEBRUARY 23, 1916, VIOLA, WISCONSIN

100 Head Reg. Hampshire Swine of All Ages--Well Bred--Well Grown--Good Type--Well Belted--Prolific

THIS offering is the result of many years of careful breeding and good care. That I raise good ones is shown by the fact that I have shipped to many of the best breeders in Iowa, Illinois and Wisconsin My present herd is of the type that wins in the show ring. This is an opportunity for every farmer who is interested in good Hampshires to get the best of breeding stock at his own price. Auctioneer Col. Chas. W. O'Neill, Bridgeport, Wis. Send mail bids to the auctioneer or H. S. Hoard, representing The Wisconsin Farmer.

R. L. CURRIE - - - - - **VIOLA, WISCONSIN**

Distinction and out of the sow, Crowd Anna Wonder by Brigadier, the noted boar of Ed Baxter. Hazelhurst Colonel is by H. C. Nodolf's noted boar, Col. E. and out of Pilot Girl 2d, a sow bred by E. D. McReynolds. The gilts offered for sale are bred for March and April litters to Burn Brae Golden Model, a son of Golden Model Chief. These sows are well grown, of good type, large size and smooth quality.—Adv.

Birchwood's Guernseys.

THE Birchwood Guernsey Farm, Rosendale, Wis., owned by M. L. Welles, is advertising some exceptionally good registered Guernsey heifers and yearling bulls for sale on page 47. These were sired by the noted bull, Dairymaid's King 12898. This bull is backed by some of the highest producing blood in the Guernsey breed, both his sire and his dam come from long lines of high producing ancestry. His full sister, Dairymaid of Pinehurst, made 910 pounds of fat in a year, which is equivalent to 1,137 pounds 80 per cent butter. As an individual, Dairymaid's King, cannot be faulted, being a bull of great size with good width and depth, a long, straight rump with a soft, yellow skin. The heifers and bulls advertised for sale are out of A. R. cows of choice breeding. Any of our readers who are in the market for a yearling bull, ready for immediate service, can do no better than to look over these animals. They are well grown, of good dairy type and there is every reason to believe that they will transmit the desirable qualities which they have inherited. For pedigrees and description of each individual write to the above address. When writing kindly mention The Wisconsin Farmer.—Adv.

Rust Bros.' Holsteins.

A TWENTY-EIGHT-POUND bull is advertised for sale on this page by Arthur Rust, West Allis, Wis. This bull was born May 14, 1914, so is ready for immediate service. His dam, Aaltje Salo Princess 3d Pontiac, as a four year old made 27.99 pounds of butter in seven days. In a year she gave 16,646.10 pounds of milk and made 754.26 pounds of butter. She is a daughter of Johanna Pontiac De Kol, that has twenty-two A. R. O. daughters. Among these are four with records from 27.54 to 29.74 pounds of butter in seven days and six others with records above twenty pounds. His sire was Johanna Rue 3d's Lad, that has forty-eight A. R. O. daughters, four with records from thirty to 36.86 pounds of butter in seven days and twenty-eight others above twenty pounds. The sire of the bull advertised for sale is Cornucopia Netherland Mechthilde, that won third prize as a yearling at the 1913 Wisconsin State Fair. From this limited description of the breeding it will be seen that high producing blood flows in the veins of this bull. For an extended pedigree and description write to the above address.—Adv.

Derivan's Poland Chinas.

ATTENTION is called to the change of advertisement of James Derivan, Fox Lake, Wis., on this page. Mr. Derivan's Polands are well and favorably known to many of the readers of The Wisconsin Farmer. He reports very favorable results obtained from his advertising this year in spite of the corn crop failure. In fact, he is practically sold out of spring and yearling boars and sows and is now advertising 1915 September pigs of both sexes. The writer met Mr. Derivan on the Poland China sale circuit where he bought a number of outstanding bred sows. At the sale of B. W. Young, Prosper, Minn., he bought a gilt sired by Rood's Big Joe by Big Joe by Smooth Wonder and out of a daughter of long King's Best. At the E. W. Hendricks' sale at Hazel Green, Wis., he bought three excellent sows of approved breeding and high individual merit. If you want some good fall gilts or boars write him at once.—Adv.

Little's Milking Short-horns.

THE Short-horn herd of Harvey H. Little, Evansville, Wis., is distinguished both for the heavy milking qualities as well as the great size and good type of the individuals. Although the milking ability of the cows has been kept uppermost in selecting breeding stock it has not been obtained by any decrease in physical perfection. The yearling bulls now offered for sale are out of heavy producing cows, giving as high as 1,100 pounds of milk per year. They were sired by Bonnie Scotchman, a grandson of the noted bull, Whitehall Sultan. These young bulls are well developed and of good, straight type. See page 47.—Adv.

Good Money in Little Ford Milking Stools.

THE Little Ford milking stool, shown in the advertisement on page 33. pays for itself in a short time with the milk which it saves from spilling. It also helps keep the milk clean. These stools are made of durable metal and are fully guaranteed. Agents are wanted everywhere to sell this stool for $1.50 and they are said to be big sellers wherever shown and introduced. Write for attractive agents' proposition and circular to J. A. Paul, 903 Washington St., Waterloo, Iowa, and kindly mention this paper.—Adv.

Collin's Poland Chinas.

BIG-TYPE Poland China bred gilts are advertised for sale on page 47 by P. N. Collins, River Falls, Wis. Mr. Collins issues a private sale catalog, which is very interesting. It shows the breeding of the animals being offered for sale and convinces one that these gilts carry the blood of the best known animals of the breed. His Poland Chinas are especially prolific, averaging ten to the litter. The bred gilts offered for sale were sired by Black Bone, Square Deal and Black Model. Black Bone is a boar of great size with eleven-inch bone and is a son of the $1,100 boar, Black Big Bone, first-prize boar at the Minnesota State Fair. Square Deal is a son of a 1,000-pound boar, Lakewood Ideal, and Black Model is a son of Peter Mouw's noted boar, Black Orange. These gilts are bred for spring litters to Black Model and Big Ben, a choice yearling boar of exceptional size. These gilts are well developed and the smooth, stretchy kind that develop into large matured sows. For further information in regard to these animals write to the above address.—Adv.

Green's Durocs.

DUROC boars and gilts of April farrow are advertised for sale on page 47 by W. T. Green, Orfordville, Wis. These were sired by Professor 2d, a son of the noted show boar, Professor, and are out of sows of Chief J. E. D., Ohio Chief and Grant's Colonel breeding. Mr. Green has an excellent herd of Durocs, which he has developed by careful selection of his breeding sires and dams. He has always purchased good individuals of proven lines of breeding, regardless of what they cost, realizing that the cost of seed stock is of little consequence in proportion to the quality of the animals produced. For pedigrees and further information in regard to the animals offered for sale write to the above address.—Adv.

Bate's Dairy Short-horns.

GEORGE WENHAM & SONS, Ft. Atkinson, Wis., are offering some extra good Bates dairy Short-horn cows for sale on page 47. These were sired by the noted bull, Clayton Buttercup 19588. He was a son of Imp. Duke Buttercup, whose daughters are noted for their heavy milking ability. Eight of his daughters gave from 9,000 to 11,000 pounds of milk in a year. Some of these cows are bred to Oxford I 2d and are due to freshen soon. Mr. Wenham is also offering five choice yearling bulls, sired by Oxford Duke I. For further information in regard to these animals write to the above address.—Adv.

Marinette County Asylum.

POLAND CHINA swine and Holstein cattle are advertised for sale by the Marinette County Asylum, Peshtigo, Wis. They are offering bred gilts bred for spring farrow and can still supply a few good boars ready for spring service. In Holsteins they are offering some choicely bred young bulls sired by King Walker Segis 3d and will also price a few females. For extended pedigree and further information in regard to these animals write to the above address. See page 46.—Adv.

Frank Morley's Short-horns.

SHORT-HORN bulls, ready for immediate service, are advertised for sale on page 47 by Frank Morley, Baraboo, Wis. These were sired by McK's Masterpiece and out of big, heavy-producing cows of choice breeding. Mr. Morley is also offering a few bull calves from two to ten months of age. The yearlings are of white, red and roan color, are well grown and of good, straight type. For pedigrees and description write to the above address.—Adv.

Ward's Holsteins.

REGISTERED Holstein cows, yearling heifers and yearling bulls, ready for service, are advertised for sale on page 46 by C. E. Ward, Palmyra, Wis. The yearling heifers and bulls are sired by the 31.11-pound bull, Briar Abberkerk De Kol 76694. He is an exceptionally good individual, being very long-bodied, wide and deep and of good, straight conformation. For pedigrees and further information write to the above address.—Adv.

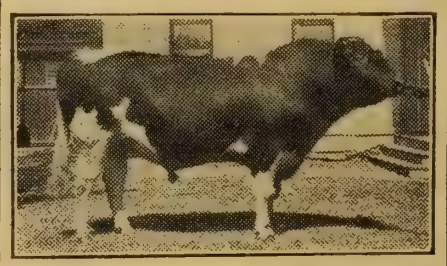
THE BUILDINGS AND HOLSTEIN HERD OF BALTZ HOESLY, NEW GLARUS, WIS., WHOSE ADVERTISEMENT APPEARS ON PAGE 46.

Grundy's Short-horns.

THE Short-horn herd of A. T. Grundy, Oshkosh, Wis., is made up of high-producing animals of Bates breeding. This herd has been established for a great many years and is one of the best Bates herds in the Northwest. Heifers eight to twenty months of age and bulls of serviceable age and younger are now being advertised for sale on page 47. Mr. Grundy is also a breeder of big-type Poland China swine and is offering some extra good spring boars and fall gilts. For further information in regard to the animals now being offered for sale write to the above address.—Adv.

A Home Built Concrete Mixer.

THE Sheldon Mfg. Co., is offering to send blue print plans for a practical and satisfactory concrete mixer which you can make at home. It is highly endorsed by engineers and many users, is simple and costs but little. All you need to do to get these plans free is to write for them to the Sheldon Mfg. Co., Box 4493, Nehawka, Neb., and mention their advertisement on page 18.—Adv.



ONONIS SADIE CORNUCOPIA, a noted Holstein bull owned by Rust Bros., West Allis, Wis. See advertisemetn on this page.

Trieloff's Holsteins.

TRIELOFF BROTHERS, Ft. Atkinson, Wis., are offering two nice bull calves for sale on page 46. They are seven-eighths white and from good A. R. O. cows with creditable records. They are also pricing heifer calves very reasonably. For further information in regard to breeding write to the above address.—Adv.

Coleman Lanterns Save Work.

COLEMAN gas lanterns require filling only once a week and cleaning only once a year, saving lots of work and time. They give a steady, clear light of 300 candle power and can't blow up, explode or leak, but may be used with perfect safety in barns and other outbuildings, as well as around the home. For further details see the advertisement of this serviceable lantern on page 13 or write the Coleman Lamp Co. at any of the branch offices named there, mentioning this paper.—Adv.

Cream Separators From $15.95 Up.

THE American Separator Co., has cream separators that are guaranteed to do your work satisfactorily at prices of from $15.95 up. The bowl is easily kept clean, the mechanism simple and along the most approved scientific lines and they are sold on your approval after a careful test. For a handsome free catalog, showing you American separators adapted to any size dairy, address American Separator Co., Box 3126, Bainbridge, N. Y., and kindly refer to their advertisement on page 33.—Adv.

Dunham's Percheron Catalog.

DUNHAM'S, Wayne, Ill., call the attention of the buyer in their advertisement on page 45 that they have a finely illustrated catalog of their Percherons they will be glad to send to all who are interested enough to write for the same. For fifty years Oaklawn has been headquarters for all that is best in Percherons, and this season they are as well equipped as ever to care for the wants of their customers. Send today for the catalog and mention this paper when you write.—Adv.

Meco Engines Guaranteed Five Years.

MECO engines are guaranteed for five years and you can get one on trial if you will send the makers the name of your dealer. They are made for gasoline, kerosene or gas fuel and are said to give splendid satisfaction. Some of their prices are shown in the Meco advertisement on page 28. For further information write for their engine catalog to Manufacturers' Engine Co., 1761 Crystal Ave., Kansas City, Mo., and kindly mention this paper.—Adv.

Agents Wanted for Beacon Burners.

THE makers of Beacon burners, which fit any lamp and are said to greatly increase lighting power and to decrease the cost of running it, desire a local patron in every town to whom they can refer new customers. To such a person they have a special offer to make, according to their advertisement on page 39. They also want good local agents everywhere. In writing them regarding it address Home Supply Co., 89 Home Bldg., Kansas City, Mo., and kindly mention this paper.—Adv.

HORSES.

IMPORTERS AND BREEDERS OF

PERCHERON, BELGIAN AND CLYDESDALE STALLIONS AND MARES

WE now have in our barns more big-boned, rugged draft colts, from yearlings to 4 and 5 years, of the different breeds than ever before. We have two-year-olds that weigh over a ton—herd headers and show propositions.

Five farms over 1,000 acres devoted to the horse business. We do all our own buying and selling, grow all our own feed. Our economical way of handling stallions saves money for the purchaser. We guarantee all horses sold and can sell you a high-class stallion cheaper than any other firm in America.

We are located in North Central Iowa, 20 miles from the Minnesota line, on the C. M. & St. P. Ry., midway between Mason City and McGregor.

Send 20c in stamps for large Horse Hanger which shows our Main Farm and sales stables. Correspondence a pleasure. **We have a horse for every purse.**

FRANK P. SHEKLETON & SONS, LAWLER, CHICKASAW CO., IOWA

FARMERS REVIEW PROGRESS.

(Continued from page 25.)

cent poor stands? Forty-four per cent of these failures were due, according to reports of these farmers, to a need of lime and inoculation.

Members of the Alfalfa Order, I have received many reports on alfalfa growing in Wisconsin during by secretaryship of this organization and it is the same thing every year—the two greatest factors causing failures of alfalfa growing in Wisconsin are a lack of lime and inoculation.

Other causes for failures in order of their importance are as follows:

1. Poorly drained flat land.
2. Nurse crop too thick.
3. Early spring freezing and thawing.
4. Land of poor fertility.
5. Weeds and poor preparation of seed bed.
6. Crowded out by blue grass.
7. Drouth after nurse crop.
8. Miscellaneous causes.
9. Lack of snow covering.
10. Loose seed bed due to late spring plowing.
11. Late fall pasturing.

President Cheeseman in his address reviewed the alfalfa conditions of the last year and pointed out its increasing favor as an economic feed.

COUNTRY LIFE OFFICERS.

At the fifth annual Country Life Conference held in Madison last week the following officers were elected: President, Ernest N. Warner, of Madison; secretary, Charles J. Galpin, of Madison; advisory council:

Rev. R. O. Brandt, McFarland; W. H. Bridgeman, Stanley; Charles Brigham, Blue Mounds; J. C. Brockert, Platteville; G. F. Comings, Eau Claire; Miss Mary Connor, Windsor; H. M. Culbertson, Medina; G. W. Davies, North Freedom; John Donald, Mt. Horeb; Mrs. David Haddow, River Falls; Rev. Joseph Heyde, Middleton; A. W. Hopkins, Madison; F. H. Lindsay, Milwaukee; Rev. C. D. Mayhew, Baraboo; H. A. Moehlenpah, Clinton; Miss Ellen B. McDonald, Oconto; Edgar Packard, Berlin; J. J. Phoenix, Delavan; Miss Lutie Stearns, Madison; Rev. W. F. Tomlinson, Platteville; William Toole, Baraboo; Wes. Tubbs, Madison.

COW TESTERS ORGANIZE.

The first meeting of testers for the various cow-testing associations in Wisconsin was held at Madison last week in connection with Farm and Home week and resulted in the organization of a state association which will meet annually.

Louis Bober, of Lone Rock, formerly official tester at Hillsboro but now with the association at Lone Rock, was chosen president. Richard F. Adams, of the Stanley Co-operative Cow-Testing Association, was named vice president and A. H. Parrot, of Menomonie, was made secretary-treasurer.

There are now forty-five cow-testing associations in the state, and this number, it is believed, will be increased to sixty this spring. About 25,000 cows are now under test, and some 1,500 farmers have substituted the scales and the test for the guess method of dairying. About two-thirds of the official testers in the state attended the Madison meeting.

A special program was given throughout the week under the direction of H. C. Searles, superintendent of the testing associations, and N. G. Negley, of Madison, his assistant, and it was the consensus of opinion that much good was accomplished and that the testers will return to their work with new enthusiasm and new ideals for better dairying. This they will carry to the farmers allied with the associations, and it is planned to hold an annual conference each year.

Abnormal purchases of wool by Americans in Australia and New Zealand has caused much comment in trade circles in London, and the view has been expressed that the reimposition of the embargo on export raw material from the colonies of Great Britain to the United States is necessary. There is a general impression that America is buying wool in order to manufacture for the German market goods which, immediately peace is declared, will be shipped across in the German ships interned in United States harbors. In this way, it is believed, the American trader hopes to get ahead of the British manufacturer.

Reg. Percheron Stallions

Purebred Registered
HOLSTEIN CATTLE

The Holstein-Friesian bull possesses a strong constitution, superior we believe to that of any other dairy breed. Hence his value for grading up ordinary herds. A Cornell bulletin describes results secured in grading up its herd of twenty cows. The cow, Freddie, three-quarters Holstein, in forty-five weeks produced 11,693¼ pounds of milk, containing 413 pounds of butterfat, or 3.53 pounds. Ruby, three-quarters Holstein, produced in forty-eight weeks, 13,574 pounds of milk, containing 430 pounds of butterfat, or 3.17 per cent. This shows what a purebred Holstein bull will do. Investigate the big "Black-and-Whites."

Send for **FREE** *Illustrated Descriptive Booklet.*

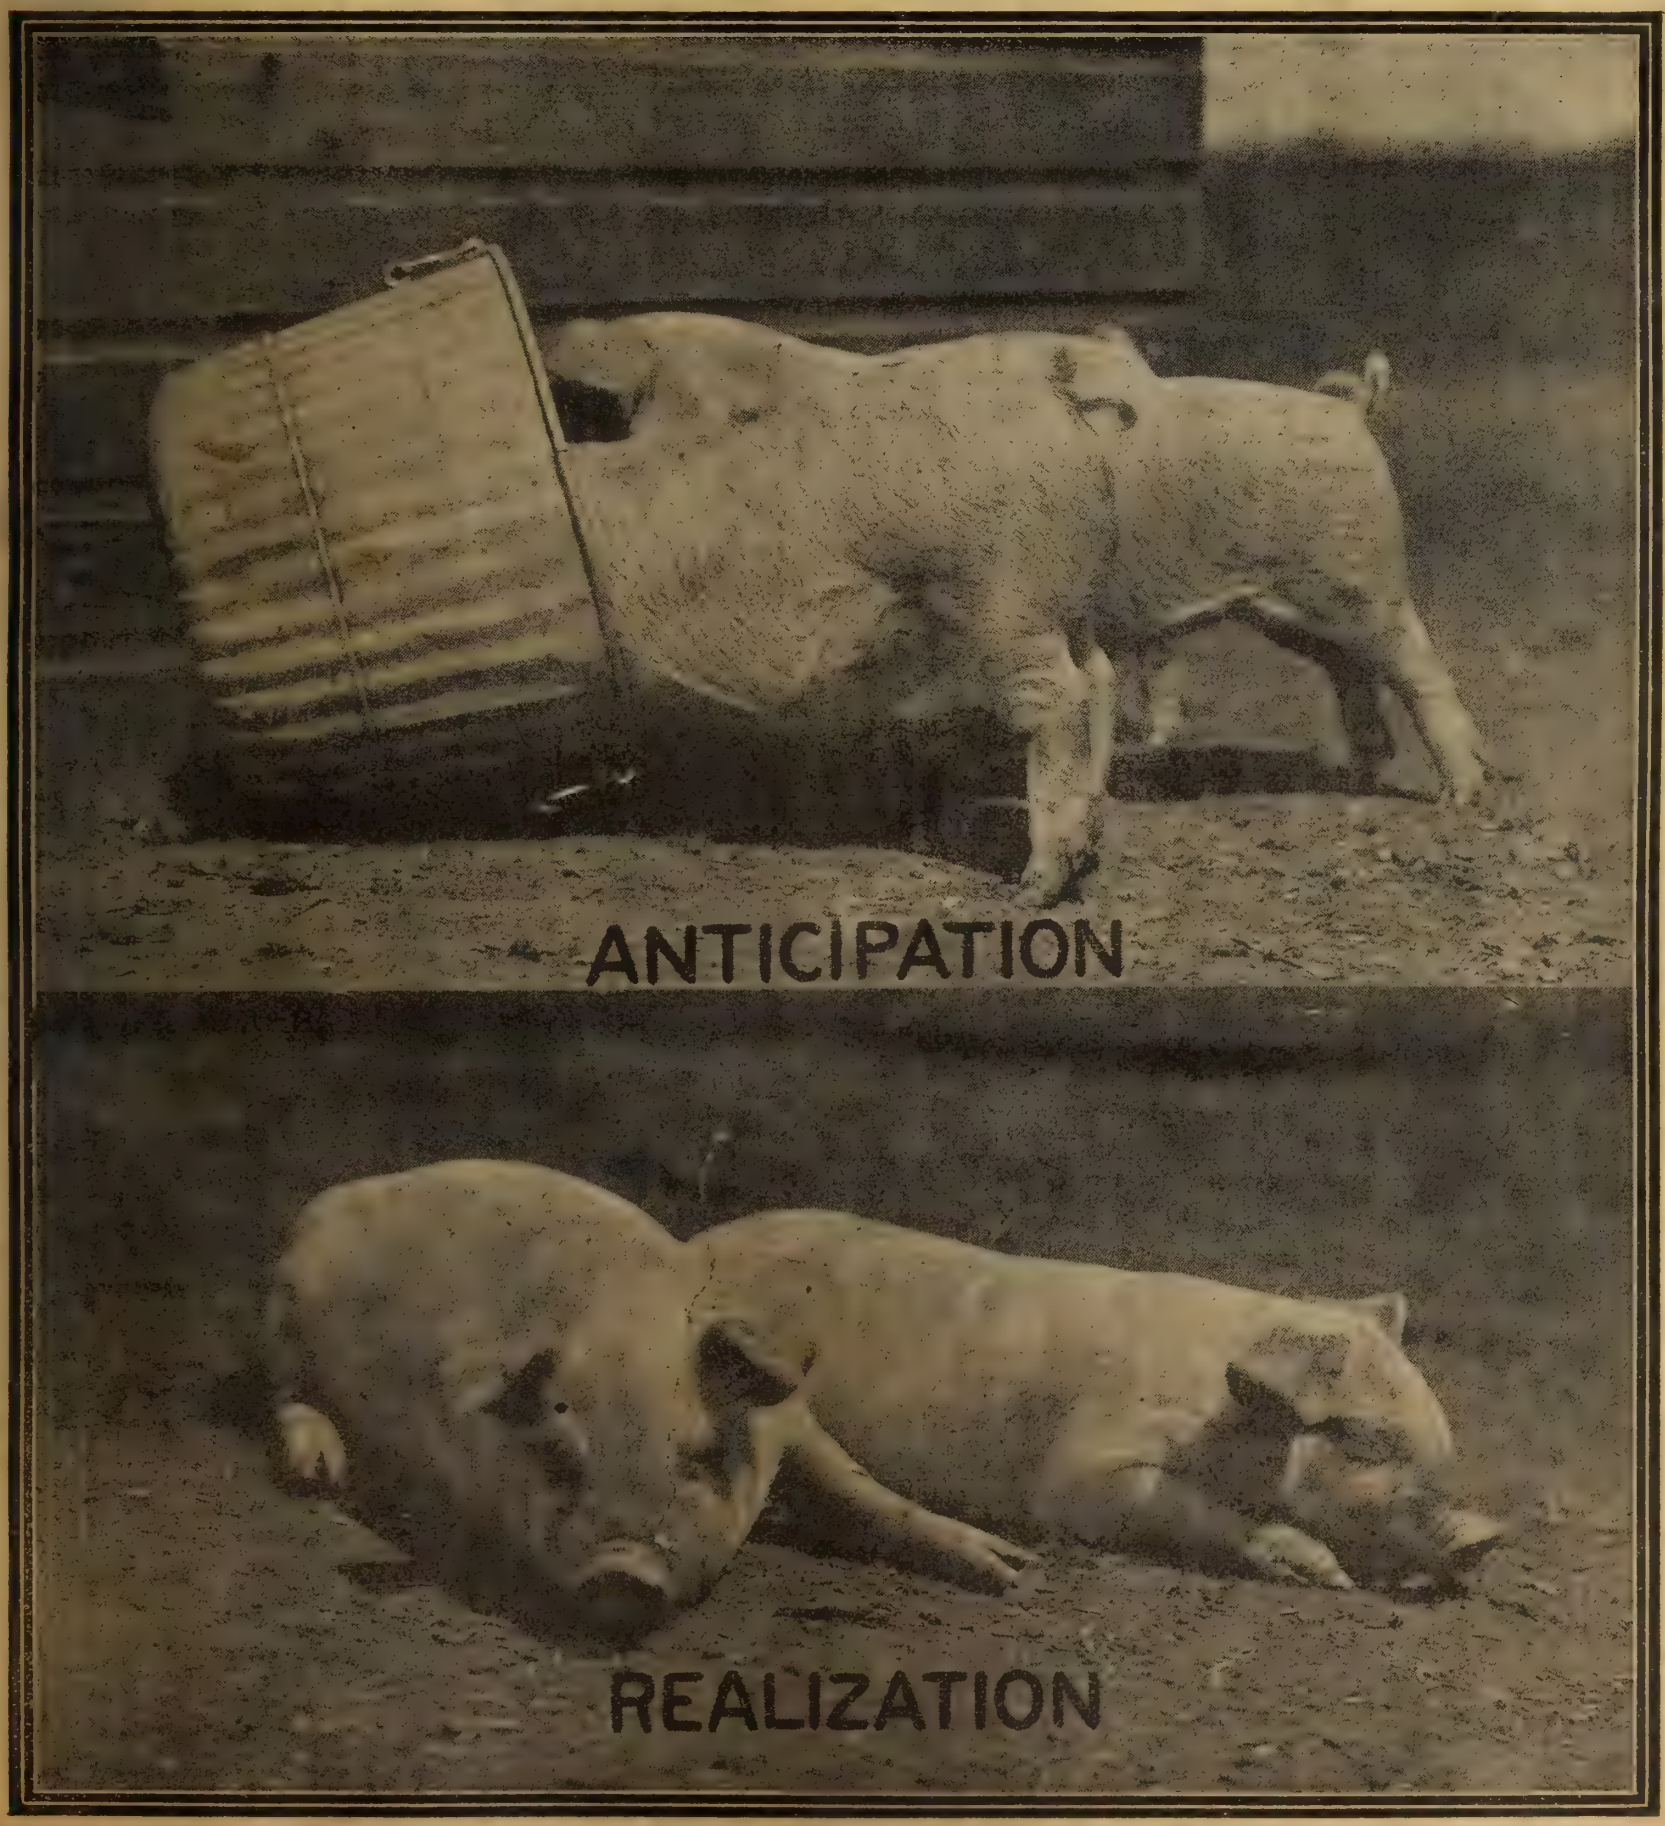
VOL. XLV. NO. 8. THURSDAY, FEBRUARY 24, 1916. WHOLE NO. 1778



Decide NOW to Get a Tractor

Last year more farm tractors were bought in the United States than in all previous years combined. There is a reason for this rapid increase in sales. Farmers are finding that the tractor is a GOOD THING---that it does some things quicker and cheaper than horses will do them and that it does other things that horses cannot do. Here is a list of boiled-down reasons why you should buy a tractor:

Buy a Tractor Because—

First—A good tractor will do all your belt work easily and take the place of horses in heavy field work. One moderate investment instead of two; one machine to take care of and no housing and feeding expense for a number of horses during winter months.

Second—It cuts down your labor costs. Help is scarce in the rush seasons. One man with a tractor will do as much as three or four men with teams.

Third—Experts tell us that deep plowing must be practiced in order to get the best crop results. This is work in which a tractor is better than the best team of farm horses that ever wore harness. EVERY ARGUMENT FOR DEEP PLOWING IS AN ARGUMENT FOR A TRACTOR.

Fourth—A tractor is built for heavy work—the kind that takes the life out of horses. Why drive flesh and blood to such work when you can make unfeeling steel do it? Save the energies of your horses for lighter work; and in particular save the strength of your brood mares.

Fifth—Speed up your work. You can run a tractor from sunrise to sunset in any weather and it never gets tired or sick. You can push it as hard as you like—you always have speed and power to spare. Getting crops in quickly when the soil is in condition to produce proper germination and vigorous growth means a better yield. This is a BIG argument for tractors.

Sixth—A tractor gives power enough to perform two or more operations at once: plowing and rolling; plowing, discing and harrowing; plowing, harrowing and seeding, etc.

Seventh—A tractor eats nothing when idle.

Buy an Eagle Tractor Because—

First—It is built to meet the tractor needs of medium-sized Wisconsin farms and farm conditions.

Second—It combines in one machine the best tractor features and gives excellent service in all farm belt work.

Third—It has the famous Eagle two-cylinder Valve-in-Head Motor which gained such widespread popularity in EAGLE Portable Farm Engines. You get smooth, lively power in both tractor and belt work.

Fourth—This tractor is strong, simple, and with all parts accessible—built to be run and cared for by the average farmer.

Fifth—It sets low; is correctly balanced; is safe on turns and side hills and has a good toe-hold on the ground.

Sixth—It picks up a load easily and gets to full speed quickly and smoothly.

Seventh—It is a RELIABLE tractor at a very reasonable price.

Fill Out the Coupon—We want to tell you more about tractors on the farm—more about the success of EAGLE GAS TRACTORS. All you have to do to get more complete information on tractors is to write your name and address on the coupon and mail it to us NOW.

FAMILY CIRCLE TALKS
BY THE PUBLISHER

THE PRESIDENTIAL CAMPAIGN.

TO THOSE of us who have been busy in office and field, the fact that another presidential campaign is right upon us comes as a distinct surprise. Yet the grain belt will begin to speak its mind on this all-important matter within another month. I, for one, can hardly realize that the campaign is so imminent.

I consider it eminently appropriate that the grain belt should be the first section of the country to speak out for men and measures. Why should it not? Is it not here that the bulk of the reforms which have swept our nation in the last decade have been launched? Is it not here that the men have been produced, in all parties, who have overthrown the corruption which once existed unrebuked in high places, giving back to the people the reins of government of which they had all too long been despoiled? Is it not here that we find the most calm, unprejudiced reflection on the big issues of the day, those issues upon which our future peace, prosperity and happiness depend in large measure? This being the case I, for one, believe it to be eminently fitting that we should be the first to speak our mind on presidential policies and candidates.

Minnesota has the honor to be the first state of the forty-eight to hold a presidential primary. The date is March 14th, only three weeks distant. North Dakota follows a week later. Then, in rapid succession, come South Dakota (on April 4th), Nebraska (on April 18th) and most of the other states of the grain belt. Surely, here is an inspiration to the rest of the nation, for nowhere has the movement to allow the people to vote directly for presidential candidates and for the delegates to national conventions gained such headway as here in the middle West. No matter who may win out at the various primaries it is a matter of congratulation that we of the grain belt have led in this movement to make the vote of the people, rather than the voice of the bosses, supreme in naming our national standard bearers and deciding on the issues upon which the campaign shall be fought.

With the first presidential primaries only three weeks distant and the others a matter of but a few more weeks, I want to urge upon all my readers that they give this matter their most careful and conscientious thought. The campaign is upon us before we know it; let us lose no more time, but get down to calm reflection, to the end that the best men may be nominated and that policies may be decided by the people themselves, even in the most obscure and distant precincts and townships. Let us begin at once to take counsel one with the other, talking over candidates and issues as we go about our daily work, as we meet our friends and neighbors in town or on the road, at church or at our community clubs. Let us put aside the war and the weather as our favorite topics of conversation and get into the presidential campaign before the primaries come upon us.

I am not advocating the candidacy of any one man or set of men. I am not here championing any particular principle or policy. I do urge, however, that none of us be too quick to forget. There are certain things which must be thought over carefully in connection with the coming campaign, particularly by farmers. Notable in the list are these: Preparedness, the proposed non-partisan tariff commission, the tariff as a whole (not forgetting our experiences four years ago, when Canadian reciprocity was such a big and vital issue), agricultural educational extension, conservation, railroad regulation, and so on. No matter to what party we belong, we should have decided views on all these subjects, for all have a direct bearing upon our agricultural welfare. Having such decided views, we should see to it that, so far as lies in our power, the men are named for the presidential race who most honestly and sincerely represent our views. The president is a man of great power, he occupies a position of immense trust and responsibility; yet the beginnings of his greatness and power are laid in the township and the precinct primaries, where you and I—common people, whom the president never knows—express our rights as sovereign citizens. How can we expect our president to do his full duty if you and I—who make him president—do not do our full duty, by voting at the polls, by deciding issues among ourselves and by exerting our franchise right to the utmost?

I want to urge upon you all, without regard to geographical location or political affiliation, that you get into the presidential campaign at once, without delay, so that when the time comes for you to raise your voice you can do so without hesitation, to the end that the man may be elected who will most truly represent the farmers of America and most surely put into execution those policies which will make our farming more certain and profitable, our peace more stable and our national honor more incorruptible.

MOTOR MECHANICS.

I SPENT a very pleasant hour recently attending one of the numerous automobile shows which have come to be popular annual events here in the grain belt. Two things particularly impressed me. First, the great number and variety of the cars made. Second, the wonderful popularity of automobiles with farmers and their familiarity with motor operations. It seems to come as naturally to a farmer nowadays to talk of carburetors and gears, transmission and differential, as to speak of varieties of corn and oats and the superiority of various breeds of live stock.

I have seen it estimated that the farmers of the ten states of the grain belt are spending $250,000 a day for new motor cars. From what I saw at the recent automobile show I believe these figures to be conservative. One of the popular makes of cars held daily lectures and demonstrations, conducted by a member of the faculty of the agricultural engineering department of the state college. Nine-tenths of the men who attended these lectures were young farmers. The eagerness with which they drank in every word convinced me there is nothing under the sun in which the farm boy of today takes a greater interest than mechanics, and motor mechanics, in particular.

I can readily understand now, better than ever, the exceeding popularity of the department in this paper entitled, "Farm Mechanics." I was the first farm paper publisher in the country to add such a department regularly to my papers. The great number of letters coming in daily, asking questions for the expert in charge of that department to answer, convinced me of its value. I had only to see the eagerness with which these young farm boys attended the motor demonstrations and lectures at the automobile show to realize how ready they are for just such information as we have been giving them for the last two or three years.

BUYING WAR HORSES HAS STOPPED.

CAN WE foresee the end of the European war because the buying of horses and mules here in the middle West, for war service across the seas, is practically at an end? Here is an interesting topic which we can well afford to discuss for a few minutes.

There is no question but that the European war has enabled farmers to dispose of a lot of surplus horseflesh at exceptionally good prices. Our "scrub" stock has been sold around $100 and $125, prices which were never dreamed of before the war made the large demand for "cannon fodder." The average life of the horse or mule bought here in the grain belt and shipped to the front in Europe, is said to be only ten days or two weeks. This has made the demand for horses and mules by the British, French and Italian armies something undreamed of by the farmers and unheard of in any former war. I have seen it stated that 60,000 horses and 120,000 mules have been bought and shipped through the Kansas City market since the war broke out, for the armies of Great Britain and its allies, to say nothing of the large numbers bought and shipped through other markets in the grain belt. That this immense war demand has not robbed the farm of its necessary and desirable animals is shown by the fact that the Department of Agriculture has recently reported more horses on the farms of America January 1, 1916, than there were a year ago, the average value being higher. Not only have we sold our surplus and "scrub" stock at wonderfully good prices, but we have more animals today and they are worth more to us. Here is an exceptionally pleasing condition of affairs.

But what I started to point out was that the fighting nations of Europe are beginning to withdraw their buyers and this has led many to believe that the end of the war is in sight, for supplies must still be transported and, so far as any of us here can see, the war, if it is to continue, must be prosecuted in the future as in the past. True, we may expect more and more trench fighting and fewer dashing charges, but supplies must be carried to the men in the trenches and if the war is to continue there will be need of horses and mules just as in the months gone by. Yet what is the situation? Let me quote a little from a grain-belt newspaper:

> Does the British government believe the end of the war is in sight?
>
> In November there were in the United States about forty officers of the British army remount service, all engaged in the purchase and shipment of horses and mules for the allied armies. Since then many have gone back to England, and it was learned yesterday that the remaining officers in the United States have been recalled.
>
> There are ten British officers in the remount commission at Lathrop, Mo., and these expect to embark for England within a fortnight. All the members of the remount service in the United States will have left by March 15th, a member of the commission at Lathrop said yesterday.
>
> No purchases of horses in the Kansas City market have been made by the British since November 15th, and according to the remount officers none has been bought in this country since then.

When we consider that one horse-buying firm had 500 buyers in the field a short time ago, scouring the grain belt for animals for the war, and that practically all of these buyers have now been called in, it looks very much to me as though there might be war developments within the next few weeks which will surprise the world. I certainly hope that my optimism is not ungrounded and that before long we will begin to see the first rays of hope—hope that the warring nations of Europe are at last beginning to recover their lost senses and that awful, devastating, un-Christian war may be driven from our midst, not to dare to show its hideous features again for many, many years to come, if ever.

BOYCOTTING THE R. F. D.

REPORTS continue to come to me showing that farmers are victorious over the post-office department and that rural mail routes are being re-established on the old basis, so as to give better results. By this time the postal authorities at Washington must be convinced of two things: First, that the order combining routes and expecting carriers to cover fifty miles every day (rain or shine, snow or storm) was impractical and demoralized the service; second, that the farmers of the grain belt, once they become thoroughly aroused, exercise an enormous influence. I imagine there are few grain-belt congressmen who have not sent protests in to the postoffice department, on behalf of their rural constituents, since the change went into effect a few months ago.

One of the reports which has just come to me shows how the farmers of a community where the R. F. D. service had been altered and impaired went about to restore the old order in a rather novel manner. They simply boycotted the service until the carrier, thoroughly alarmed over the situation, reported the matter to Washington and an order came back, post-haste, to give the farmers what they wanted, which, in this case, was simply the old service with which they had been very well satisfied. Here is the way a subscriber tells the story, writing to me from Muscatine, Iowa:

> Farmers along the Conesville rural route boycotted Uncle Sam's rural carrier and won their fight. Last fall when the postoffice department put in its general revision of routes the Conesville and Nichols routes were merged. Conesville patrons declared they were victimized and they would refuse to accept an inferior service. So they declared a boycott of the rural route. For weeks the rural carrier traveled his route without receiving a single article of mail and most of the farmers traveled all the way to the postoffice to claim their papers and letters. This week the old separate routes were restored.

Good for the farmers of the Conesville route, I say. Ordinarily I am not in favor of the boycott principle, but there are times, such as this, when it is most effective. With a presidential campaign almost upon us and all parties anxious to secure rural support, it ought not to be a hard matter to get the postoffice department to back water and restore the R. F. D. service to the efficiency which it had reached before some misguided official, in the interests of bogus economy, interfered.

James M. Pierce

THE WISCONSIN FARMER

A WEEKLY JOURNAL OF AGRICULTURE, HORTICULTURE, STOCK RAISING AND ALLIED INDUSTRIES

BY JAMES M. PIERCE

JAMES ATKINSON, Editor-In-Chief

ESTABLISHED IN 1848

Entered at Des Moines Postoffice as second-class matter

PUBLISHED EVERY THURSDAY

1912 Grand Ave. Des Moines, Ia. | 201 Washington Bldg. Madison, Wis.

To either of which communications relating to subscription or advertising may be addressed.

MEMBER AGRICULTURAL PUBLISHERS' ASSOCIATION
MEMBER AUDIT BUREAU OF CIRCULATIONS

SUBSCRIPTION RATES—Single subscriptions, $1.00 a year. In clubs of ten, 75 cents a year and an extra copy to getter up of club. In clubs of fifty or more, 25 cents a year. Single subscription three years in advance, $1.50; five years in advance, $2.25; ten years in advance, $4.00. Subscription prices in Canada, $1.50 a year. Remit by draft, registered letter, postoffice or express money order. In changing address, send both the old and new addresses. In renewing, give the same name and initials as you gave before or state both the old and new names, and explain why you make the change. In case of errors or failure to receive the paper within two weeks, promptly notify the publisher. Address WISCONSIN FARMER, MADISON, WISCONSIN

A Bouquet From Upper Michigan.

THE publisher has received this week a letter from one of our valued subscribers at Palatka, Michigan, which is just a few miles across the line from the Upper Wisconsin border. Our readers will pardon us for calling attention first to the kind words in this letter which comes to us from Arthur Burgquist. Part of the letter reads as follows:

I am a member of a family which subscribes for The Wisconsin Farmer, and certainly do welcome its weekly appearance, as it contains much interesting farming facts and shows that the farmers in Wisconsin are progressing.

I cannot say too much in praise of your paper and I am sure that most farmers will agree with me in saying that it is one of the best farm papers published.

Of course, these kind words caught the eye of the editor. Who does not appreciate such words as these? Any man who puts in his best licks on any proposition likes to feel that his work is meeting with approval. The editor of The Wisconsin Farmer and his staff of associates all feel a keen interest in every issue of The Wisconsin Farmer.

But there is another important bit of information in Mr. Burgquist's letter. Farmers, and especially the younger folks, are interested in forming a club in Iron county, Michigan. The writer advises us he has talked the matter over with neighbors and with some of the high school boys in town, and they are all agreed that "co-operation leads to better farming and dairying." So they are going to have a club where a study of these things will be made. Meetings will be held in the country schoolhouses, and some important farm topic will be taken up at each meeting.

We certainly agree with Mr. Burgquist that such a club would be a great benefit. It may help some in the way of improvement to bring in people from the outside to polish us up a bit, but the surest movement for improvement either of self or farming methods, is that which begins at home. When farmers are determined that they will make a study of their conditions and better themselves, then nothing can stop their progress. Of course, they can get a great deal of advice and help from outside speakers and from the farm press, but the biggest thing in it all is for each individual farmer and the members of his family to have a determination to live and work better. If there are a few good fellows like this subscriber at Palatka, Michigan, who will go into this club work and agricultural and live stock study in earnest, we predict that wonderful good to all the community will be the result. Iron county is on the southern border of the Michigan upper peninsula, and the conditions are very similar to that in Upper Wisconsin. We bespeak for the new club at Palatka great success. The information asked for in Mr. Burgquist's letter will be cheerfully furnished. If there are any other readers of The Wisconsin Farmer who are anxious to secure information concerning organization of clubs, we will be glad to furnish the same and put them in touch with people who will afford a great deal of help.

Work of Wisconsin Horse Breeders' Association.

DURING the past year the Horse Breeders' Association has continued its campaign for better horse breeding. Members of the association have given a large number of addresses over the state during the year on the subject of draft horse production. One of its members accompanied the Live Stock Breeders' special train over the northern part of the state and discussed the subject before many new audiences.

Special attention has been given to the importance of more careful selection of breeding stock with a view toward getting producers to breed from animals that will produce large, high-class stock of quality. The matter of giving the draft foal plenty of the right sort of feed and the proper care is even being brought before the farmers. Draft foals should make 1,000 lbs., usually a little more than half their mature weight at one year. To do this, foals must not only be properly bred, but they must be well fed and cared for.

The association by means of its futurity prizes at the state fair has been able the last three years to give special reward for the production of high-class draft yearlings. Never before the establishment of these classes has there been such a splendid display of Wisconsin bred draft yearlings. The futurity for draft yearlings has not only done much for the breeder and fitter but for the fair as well.

During the past year the association was co-partner to a new activity of the public auction sale of draft horses. The undertaking was successful, and plans are under way for an annual Wisconsin Horse Breeders' Association sale. This is a much needed line of effort and the success of the initial venture was very important. The breeders must do their part in breeding and fitting the animals, and the success of the sale is assured.

Advertising Live Stock.

ADVERTISING was a chief topic of interest at the recent breeders' meetings held in Madison. It was generally recognized that stockmen can derive great benefit from advertising in farm papers, and the only discussion revolved around the question as to how to best go about it. Advertising has been responsible for putting several Wisconsin counties and a number of individual breeders to the front. Advertising is a legitimate expense to the live stock business; it is just as important and necessary as proper feed for stock. A man may have the finest herd in the world and make very little profit from it if he fails to advertise. No breed, no matter how good it is, can assume its proper place and gain its deserved popularity without advertising of some sort.

There are various methods of advertising. A Wisconsin farmer with a number of pure breds for sale might erect a sign board in every township in the state. This would be advertising and no doubt it would bring him business. But it would be an expense far beyond the possibilities of reasonable returns. To reach a limited area a breeder may advertise in his local paper, and this also pays, though it is not possible to build up a statewide business through the medium of one local paper. The Wisconsin Farmer strongly urges the use of local newspapers when the breeder desires to reach only the farmers in his immediate neighborhood. But this is appealing to a limited market, and the best prices are never secured in a limited market. A breeder might advertise in every weekly in the state, and we believe he would get a good many replies and accomplish a good many sales, but the expense would be enormous. There would be a great deal of duplication of circulation—that is, the same man would see the same advertisement in several papers.

The most practical and least expensive method of advertising live stock, to be disposed of either at public sale or by private sale, is through the medium of the farm press. The Wisconsin Farmer guarantees to carry live stock advertisements every week to 80,000 farmers, all of whom are residents of Wisconsin or the counties adjoining Wisconsin in our nearest neighboring states. There is no other method of reaching 80,000 farmers in this favored territory so cheaply. There is waste circulation in every other class of media, for the reason that only a small percentage of the readers are interested in stock. Wisconsin Farmer readers are practically all interested in live stock, hence there is a minimum of waste circulation. Almost the entire circulation of The Wisconsin Farmer is within a few hours' ride of your stock farm, hence the readers of this paper are much more likely to buy than the readers of a paper which has all its circulation in far-distant states. The farmer or stockman who has large interests can afford to branch out by advertising in territory further away. This is especially true of a state like Wisconsin, where the character of the breeding stock is so high that it is in demand for foundation of herds any place.

It would cost $800 cash, to say nothing of the labor and printing expense, to send a postal to as many farmers as are reached in Wisconsin territory by The Wisconsin Farmer. But an advertisement can be inserted in our live stock columns for only a few dollars a week, depending upon the size, and those who are now using these columns are getting excellent returns. To send a 2-cent letter to 80,000 farmers would cost $1,600 for the postage alone. A two-inch advertisement can be run in The Wisconsin Farmer for an entire year for about one-tenth that sum. The Wisconsin Farmer's experienced field men will be glad to aid any farmer or breeder who is interested in selling his stock through advertising. Mr. H. S. Hoard, of Madison, represents The Wisconsin Farmer in eastern Wisconsin, and Mr. T. P. Shreve, also of Madison, represents us in western Wisconsin and eastern Minnesota. These men are experienced in getting up copy for live stock advertisements. They will handle your bids at public sales, provided you are unable to attend. Their services are free, and a letter addressed to either of them, care Wisconsin Farmer office, Madison, Wisconsin, will receive courteous and prompt attention.

Wisconsin Banker-Farmer Excursion.

FOR several seasons the Wisconsin College of Agriculture has been entertaining delegations of farmers from North Dakota and giving these farmers some of the latest information on dairying.

It occurred recently to George D. Bartlett of Milwaukee, secretary of the Wisconsin Bankers' Association, that the college would doubtless be willing to entertain delegations of Wisconsin farmers. Of course the college authorities were more than willing and so it has been arranged. There will be a banker-farmer excursion to Madison March 28-29th, under the auspices of the Wisconsin Bankers' Association. Any farmer in the state who is interested in the details can get complete information by calling at his local bank. Just say that you read about a banker-farmer excursion in The Wisconsin Farmer and that you would like to hear more about it.

Through the co-operation of the Wisconsin Bankers' Association and the College of Agriculture authorities, a fine program has been arranged for March 28th-29th. S. M. Smith, of Janesville, Wis., president of the state association, will preside at the first meeting to be held at 10 o'clock, March 28th. Dean H. L. Russell and R. A. Moore will speak. Farmers who desire to ask questions about pure-bred grains will have an opportunity. Here will be a good chance to bring up the subject of seed corn this year. J. R. Wheeler, of Columbus, vice-president of the bankers' association, will be chairman of the afternoon meeting. Live stock raising and alfalfa will be discussed respectively by George C. Humphrey, in charge of the state animal husbandry department and L. F. Graber, secretary of the Wisconsin Alfalfa order. There will be another opportunity to ask questions on these important topics and at 4:00 o'clock demonstrations in feeding will occur at the University barns. C. R. Thomson, of Viola, chairman of the evening session, is also chairman of one of the sub-committees of the state association. Dean D. H. Otis will talk on "Farm Management" at the evening session. There will be moving pictures to illustrate grain growing and farm fencing. George D. Bartlett, secretary of the state association, will be chairman of the Wednesday morning session, where such topics as poultry, dairy cattle, hog cholera, mutton sheep, beef production and horse breeding will be discussed. Dr. A. S. Alexander will deliver a lecture on "Better Horse Breeding," at the college auditorium at 11:00 a. m. H. J. Maxwell, of Princeton, another well-known banker, will preside at the afternoon meeting. J. G. Fuller, of the state animal husbandry department, will discuss "Swine Management," and J. C. Halpin, secretary of the Wisconsin Poultry Association, will talk about "The Care of Farm Poultry." The session will adjourn about 4:00 o'clock on the second day, March 29th, permitting all who desire to catch the afternoon trains in each direction out of Madison.

This effort on the part of the bankers should find a ready response from farmers who will surely be benefited if they attend the meetings.

Falling in Line With New License Law.

THOSE who expected the buttermakers and the cheesemakers to fight the provisions of the new license law in Wisconsin seem destined to disappointment. Wisconsin manufacturers of butter and cheese have proved themselves willing to co-operate to any end that will increase the quality and the standard of these products and the new license laws, with the proper enforcement, undoubtedly will accomplish the desired end.

The anticipated opposition to the new laws has failed to materialize to any extent. Of course there may be a few butter factories and a few cheese factories that would prefer not to come within the scope of the law, but these factories, in many cases, are those making a product that is not up to the Wisconsin standard. Fortunately there are a very few who have held back which indicates the willingness of the butter and cheesemakers to co-operate with the state in putting Wisconsin's great dairy industry upon a higher and a more stable basis. This co-operation was manifest to an especially encouraging degree at the recent convention of buttermakers at Eau Claire and at the cheesemakers convention some weeks ago in Milwaukee. An afternoon at each convention was devoted to the new license regulations and the interest displayed by the delegates indicated a willingness to do freely and with a co-operative spirit whatever the state requires in the manufacture of butter and cheese products. In the words of Mr. C. E. Lee of the dairy and food commission, "the dairy industry of Wisconsin would be far greater today than it is if such a meeting as that held at Eau Claire had been held in Wisconsin ten years ago." In other words, Mr. Lee believes the dairy industry would be just ten years more advanced had such been true.

It now remains for the farmers to do their part, which is a most important part. The new license regulations require that every cheesemaker and every buttermaker be experienced in his business before he can secure a license. They also require

sanitary factories and cleanliness and compel the factory owner to provide these things for the factory operator. That was one of the drawbacks under the old system of no licenses. The operator might be cleanly, but the owner of the factory, anxious to make as much as possible, might refuse to keep the factory in the proper condition for the manufacture of these products. The factory operators and owners have signified a willingness to be more cleanly and sanitary than ever before and both associations have gone on record approving the new laws. But to produce the highest quality product clean, sweet, wholesome milk and cream must be provided and that is the duty of the farmer to the dairy industry. Without this clean raw product, no buttermaker, however careful, can make the best butter and no cheesemaker can produce high-quality cheese. Clean, well-lighted, well-ventilated barns are necessary to clean milk production. Milk houses, free from contaminating odors, with cooling tanks for the proper care of the cream and milk until its delivery, are a great aid. Rapid collection of milk and cream: Proper care of the separator, cans and utensils, etc., all enter into the production of this product if it is to go to the factory in condition to make the quality product that Wisconsin demands and for which the market price is the highest. The factory operators can do much by talking with their patrons and in pointing out the increased value of good, clean milk and cream. But the operator, to make his advice hold good, must be clean himself, for otherwise he cannot expect anyone to follow his advice.

No Wisconsin Round-up Institute.

MR. E. L. LUTHER, superintendent of Wisconsin farmers' institutes, advises The Wisconsin Farmer that there will be no round-up this year. The round-up institute has been an annual feature of institute work. All institute workers have been gathered at the close of the season for an interchange of ideas. The last round-up was held at Kenosha, under the supervision of C. P. Norgord, now secretary of agriculture. Mr. Luther says the round-up costs $700 to $800, and he can arrange for about twenty smaller institutes for this sum. In this way a much greater number of farmers will be served by the institute staff.

The institute bulletin will be continued, but it will be made up of special articles by institute workers instead of round-up addresses as heretofore. Practically all important topics will be covered in this manner.

An important "follow-up" system has been introduced by Mr. Luther. Record is made of the inquiries at institute meetings. The director and workers at the meetings furnish all the information they have at hand and then forward the inquiry with the name and address to the superintendent. Mr. Luther has these inquiries indexed by card, and continues to supply information on the subjects inquired about. In this manner the service given the farmers of Wisconsin is made to cover a wider range than the two or three days in actual institute work. When there is found to be considerable interest in any given subject a special effort will be made to gather additional information and forward it to all who have inquired concerning this subject. Barn ventilation and sewage disposal are two topics concerning which many questions have been asked this year at Wisconsin institutes. Mr. Luther will forward information to all those who have inquired concerning these topics, and at some future date will send out a return postal card to ascertain whether the inquirer has made any of the improvements. Barn equipment and silos are also important in the minds of Wisconsin farmers, judging from the inquiries received on those subjects. Mr. Luther has accomplished a great deal in broadening the scope of institute work this year and has still further plans to improve this important branch of service.

Acreage of Peas in Wisconsin.

THERE was a reduction in the acreage of peas in the United States, as a whole, of about 25,000 acres. In 1913 there were fifty-five canneries in Wisconsin and in 1915 sixty-six reported. The leading states for the canning of peas are New York, Michigan, Wisconsin and Indiana. All showed a falling-off in acreage last year. Of these states, the falling off in Michigan was 23 per cent; in New York 15.7 per cent; in Indiana, 25.6 per cent, and in Wisconsin, 17.1 per cent. Wisconsin, in 1914, had almost as much acreage in peas as New York, Indiana and Michigan combined, and nearly two-fifths of the entire acreage of the country.

On page 16 in this paper will be found an article discussing the subject of drainage as it affects the growing of peas. Peas will be found to be a profitable crop where there is an even distribution of moisture and where there is not too much moisture. Hence the importance of looking into the matter of drainage on the ground on which peas are to be raised.

Starting With a Clean Slate.

ALL bills accumulated by the 1915 Wisconsin State Fair have been paid and the department of agriculture starts its work for the 1916 fair with a clean slate. The emergency appropriation for the payment of bills which could not be cared for from the state fair receipts, was not available until February 1, 1916, owing to an opinion by the attorney-general on construction of the emergency appropriation law. A good many premiums were not paid until this month. Most of the advertising accounts were also held up. But these bills have now all been paid in full and a new effort is to be made to make the 1916 state fair pay its way. In this effort Commissioner C. P. Norgord invites the co-operation and best wishes of all Wisconsin people.

The Cleaning and Grading of Seed Grain.

FROM time to time interesting bulletins dealing with farm problems are distributed by the national department of agriculture. It is the aim of the department to distribute these bulletins at a time when the topics discussed are of chief interest to farmers. In a recent one, for example, the question of grading seed grain is recommended and the reasons for same given somewhat in detail.

If we are to take the advice of this bulletin, small-grain seed should be carefully screened and graded before sowing. This work is ordinarily done with the fanning mill, the lighter kernels and the trash being blown out by a current of air, while the small, shriveled kernels and most of the weed seeds are removed by screens. The proportion of the seed that is removed in cleaning varies largely with the quality of the seed grain. If the grain is plump, heavy and fairly free from weed seeds the removal of about one-tenth of the entire quantity is usually sufficient, particularly with wheat and barley. In the cleaning of fairly good oats and of the poorer qualities of wheat and barley, about one-fourth of the seed should be removed. With very poor oats it is sometimes profitable to remove by cleaning as much as one-half the seed. The screenings are nearly as good for feed as the cleaned grain.

Cleaning and grading removes the small, light or shriveled kernels which will not germinate at all, or if they germinate, will produce weak plants. The removal of these kernels and the sowing of only good, plump seed helps to insure a uniform stand of vigorous plants and increase the yield. Screening also greatly reduces the quantity of weed seed which is sown, thus helping to prevent the spread of weeds and favoring the growth of the grain crop. Except with very poor seed it is usually not profitable to run it through the fanning mill more than once. However, light, trashy seed may need to be fanned twice to obtain seed that is good enough to sow.

All small grain is likely to "heat" when kept in the bin, and as heating may prevent germination, seed grain should be always carefully tested. Dig down a little way into the grain in the bin, take out a handful and put 100 grains in the seed tester or between two sheets of damp blotting paper. Keeping the grains damp and warm for a few days will tell the tale.

Unless 85 or 90 per cent of the seed tested sprouts you should increase the amount of seed sown or get better seed.

Effect of Unbalanced Rations.

WHILE it is important that rations for fattening hogs should contain a certain amount of protein to insure the most economical returns, it is equally important that they should not be overbalanced on the protein side. An all-corn ration, for example, contains too much carbonaceous matter, while an all-shorts ration contains too much protein.

At the Ohio experiment station hogs were fattened on a ration containing nine parts, by weight, of ground corn, and one part of tankage, and of that feed they consumed 430 pounds per 100 pounds gain. Another ration composed of nine parts, by weight, of ground oats and one part of tankage, they consumed 571 pounds per 100 pounds gain. Manifestly the latter ration was much more expensive, and one of the reasons for this was its high content of expensive protein. It contained one pound of digestible protein to 3.6 pounds of digestible carbohydrates, while the other contained one of protein to 5.6 of carbohydrates. An economical ration for fattening hogs weighing over 125 pounds should not contain more than one of protein to about 6.5 of carbohydrates, the latter being obtained by feeding one pound of high-grade tankage per peck of corn. With corn and oats each worth a cent a pound the hogs made a net profit of $2.28, when sold at $6.50 per hundred pounds, on the corn and tankage ration, whereas they showed a net loss of 6 cents, under the same conditions, on the oat and tankage ration.

Of course, the cost of the feed should always be taken into consideration in determining what sort of ration to feed. With corn at 70 cents and oats at 35 cents a bushel the results would naturally have been different in this test, but even then the corn and tankage ration would have produced a profit of 86 cents per head against a loss of 6 cents per head for the oats and tankage ration. Oats, while an excellent grain for growing shoats, and to a limited extent also for brood sows, is not well adapted for fattening purposes because of its high content of hulls. As a general proposition oats are a more valuable feed for horses and cattle than for hogs.

Fattening hogs do not need as much protein as brood sows. For brood sows the Missouri experiment station recommends the following combination of feeds: Corn, fifty parts, by weight; shorts, twenty-five parts; alfalfa hay, fifteen parts; and oil meal, ten parts. In our opinion this ration contains more protein than is necessary. In other words, a less expensive ration would give equally good results, provided the necessary feeds were available on the farm for that purpose. The linseed meal might be dispensed with altogether, and the corn and shorts fed in limited amounts, so as to force the sows to eat more alfalfa.

Eighth in Corn for Canning.

WISCONSIN ranked eighth in 1915 in the acreage devoted to corn for canning purposes. Illinois had 34,415 acres in sweet corn for canning and Iowa 28,936 acres. The states of New York, Maryland and Ohio had each approximately about 20,000 acres. Indiana had 16,000 and Maine about 14,000 acres. The total acreage in Wisconsin devoted to corn for canning was 7,047, an increase of 6.2 per cent over 1914. This is, in each case, the acreage actually reported by factories. Other acreage of private individuals, who sold their products to the factories, brings the total up to 7,532 acres in Wisconsin. There were twenty-one corn canning factories reported to the government bureau of crop estimate in 1914 and 1915.

Beautifying the Farm Home.

IF ONE wants to see beautiful homes the place to go is to a suburb of some city, yet the opportunities for beautifying the home are much greater in the country than in the city. First, because there is more ground available for that purpose in the country, and second because it can be done at much smaller expense. The fact of the matter is that it is not the cost of buying shrubbery or trees or flowers or grass seed for the lawn that keeps farmers from making their homes the most beautiful in the world; it is not the labor cost that stands in the way; nor is it a lack of appreciation on the part of the farmer and his wife of natural beauty. What then is the reason for this general lack of beauty in the country, such as can so easily and cheaply be provided with a few of the hundreds of varieties of shrubs and plants on the market? We believe it is thoughtlessness, very largely. Farmers have not thought much about the matter; they have seen comparatively few farm homes properly beautified in this way that might serve as object lessons and as sources of inspiration.

This is not as it should be. The farm home, regardless of its size or cost, should be an object of beauty, a place that the children may learn to love from all possible points of view, and one of which the farm wife may be especially proud. There are men to whom natural beauty may not appeal very strongly, but women who do not dearly love flowers and shrubs are indeed rare. If for no other reason, buy some appropriate flowers and shrubs or trees for the yard this year just to please your wife. It will make her happier. She will be refreshed and comforted every time her eyes rest upon her home surroundings, and through the influence of this delicate beauty she will become a more loving wife and a more devoted mother. We believe that it could be almost impossible to spend too much money or too much labor upon the surroundings of the home.

Talk the matter over with your wife and see if she does not agree with us that by the expenditure of a few dollars and a little labor the home can be wonderfully improved and actually be made a place so beautiful that people will come for miles and miles to see it. It is time that farmers get busy along these lines.

Will some of our readers who have beautified their homes please tell us how they did it, what they planted, what the cost was, and what the result has been in making the whole family happier and better for the effort put forth?

Cornstalk Ground for Drilled Oats.

THIS subject is brought up by a farmer, Mr. W. J. Telfer, who desires to know the best plan of preparing cornstalk ground for oats when it is the intention to drill in the crop. Mr. Telfer wishes to know if the stalks will interfere with drilling and, if so, how should one proceed to handle them so as to insure the best results?

As a rule, very little work is done in a constalk field where a drill is used in sowing small grain. However, it will usually pay to put some labor on the seed bed. Where the stalks are heavy they should be smashed down with a railroad iron or some such effective weapon. This task can be performed on a frosty morning much better than it can after the period of heavy frost has passed. It will then pay to give the surface at least one good disking, and there are those who strongly indorse the practice of double disking corn ground even where the grain is to be drilled in. This affords an opportunity to cross-disk so that the stalks that are not cut to pieces in one direction will be broken up when the disk is run in the opposite direction. In this way conditions are made favorable for the operation of the drills and there ought to be very little trouble from the roughage on the surface. Of course, the disk drill still further cuts the cornstalks, leaving them as a beneficial mulch on the surface where they rot down and add vegetable matter to the soil.

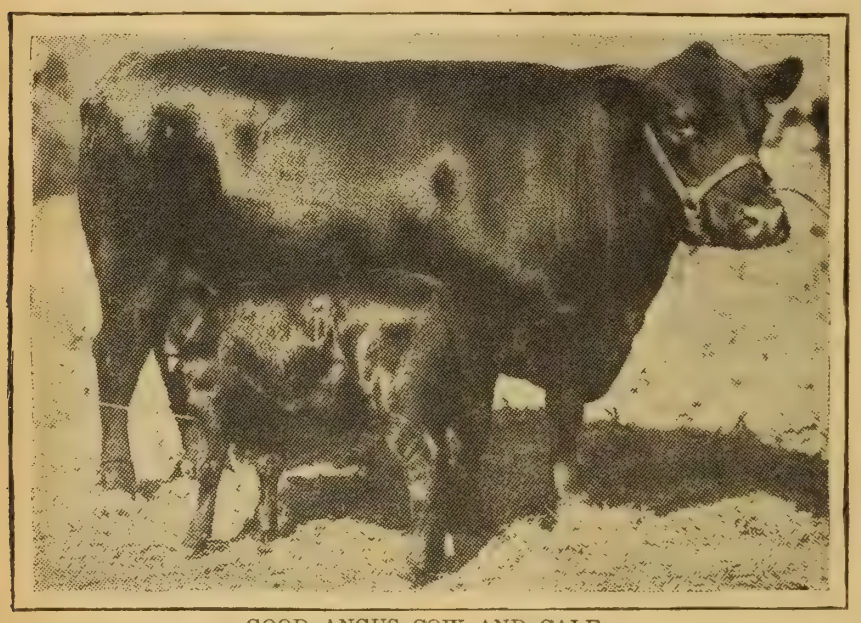
Better Beef Type Demanded.

Difference Between the $4 Beef and $10 Beef---Pointers to Wisconsin Feeders---By Parker Gelbach, Pres. Wis. Angus Assn.

HERE is a little incident which occurred in Grant county not long ago. A farmer was complaining about the price which his cattle had brought him; only $4 per hundredweight, in Chicago, when a friend spoke up: "I was just reading about a man getting $10 per hundredweight for his cattle," the friend said. "Why don't you raise that kind?" "Why?" is the question so many find hard to answer. But we are coming to a time when we must answer this question and answer it right or move to a country where land is cheaper. With all kinds of feed soaring to unprecedented prices here in Grant county this question appeals to us even more strongly.

The first thought which comes to our mind in answer to this question, "Why?" is what is the difference between these cattle which brought such a difference in price. Here it is. The $10 kind carries the meat on the parts from which the butcher obtains his choicest cuts. The $4 kind is just about the opposite. How can we solve this problem of putting the meat where it belongs? Simply by which makes a poor type of beef, will ultimately go begging. No one will be able to afford to feed him. It reminds me of the experience of a friend of mine. He bought some steers and among them was a Jersey. He didn't want the Jersey, but the seller wouldn't deal unless all were taken. So he took the bunch and put them into the feed lot and when fat sold them to the stock buyer. But the buyer wouldn't take the Jersey, as it looked too thin. He then put some cows to fatten and put this steer in with them. When they were fat he sold them but the buyer wouldn't take the steer. One day my friend received a call from a neighbor, and they agreed to butcher the steer. To their surprise the steer was the fattest they had ever had but the beef was not where the butcher wanted it.

In order to get a top price we must not only have a steer of good beef type but also a finished product, one which will reach market in prime condition. If one is in doubt as to what type is best he can get some valuable pointers from any good butcher. It is the butcher who finally gets these cattle and who really sets the gauge



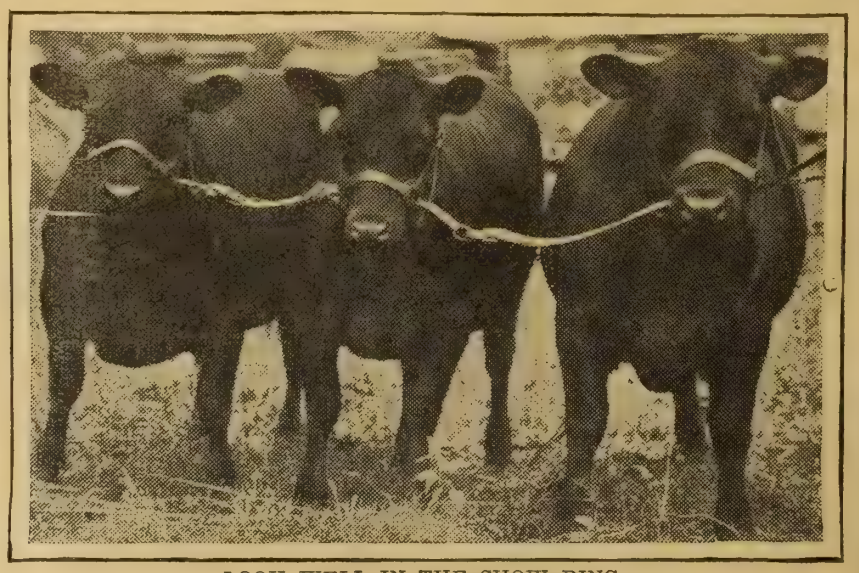
GOOD ANGUS COW AND CALF.

breeding towards that standard. That is what men have been doing for generations and what we are still continuing to do. The low price of beef cattle as compared to feeding cattle has driven many feeders out of the business, and now it seems we must raise the standard of our feeding cattle or shut up part of the feed lots.

As land prices go up and feed prices follow we will see the gap widen. The poor type of feeder, leaving the gap between the best and the poorest to be filled with other grades. And if he is the one who ultimately decides, we must produce what he wants. Neighbors of ours, a father and two sons, for several years bought yearling steers, fattened them and sold them as two year olds at a fair profit. But with the increasing scarcity of yearlings and the advance in price they found their profits diminishing. So they bought a number of grade Short-horn cows of the beef type, and crossed them with a pure-bred Angus bull. They have attained a marked degree of success and have a splendid breeding herd.

One must get cows of as near a beef type as possible, and still not neglect the milking qualities to such an extent that the cow will not be able to raise a healthy, vigorous calf. Some people are of the opinion that an Angus dam does not give enough milk for a calf, but I have not yet seen such an Angus cow. Of course, some Angus breeders have nurse cows, but so far as I know, only when in the show ring, at which time the entire show herd is crowded to the limit and then the calf is very nearly a year old, and its true mother is being dried up to give the next calf a chance.

For a number of years when we were just starting in the Angus business we bought up common calves, putting two calves to a cow, but as the buying public became more critical, and in order that we might sell our bull calves as young as possible, we now have each cow raise only her own calf, except that we usually milk one cow and put her calf on another, of course picking out one of the heavier milkers to raise the two calves sufficiently well to attain our purpose.



LOOK WELL IN THE SHOW RING.

For ordinary purposes I think almost any Angus cow will raise two calves.

What the future has in store for the beef cattle breeder is, of course, hard to forecast, but everything seems to point to a long period of prosperity for the producer. This will sure come in greater measure as soon as the business has undergone the changes essential to modern beef making.

I Will Tell You How

to Make Poultry Healthy

Make Hens Lay Make Chicks Grow

Now that mating time has arrived, it's up to you to see that your poultry get a tonic and internal antiseptics to make them vigorous and free of disease. *Therefore, feed Pan-a-ce-a.*

In that condition your hens will lay better, you will get more healthy, fertile eggs and the chicks will stand a better show of reaching maturity. *Therefore, feed Pan-a-ce-a.*

And, before the hatches come, I want to warn against gapes, leg weakness and indigestion, for these ailments are responsible for half the baby-chick losses. *Therefore, feed Pan-a-ce-a*—it will save you these losses.

My lifetime experience as a veterinarian, a doctor of medicine and poultry raiser has taught me the needs of poultry under all conditions; that is why I urge you to try my scientific and long-tried prescription,

Dr. Hess Poultry PAN-A-CE-A

It's a Tonic—Not a Stimulant

Here are a few of the valuable ingredients in Pan-a-ce-a to meet the requirements of your poultry which I have just stated:

Nux Vomica, a nerve tonic; *Carbonate of Lime*, a shell former; *Hyposulphite of Soda*, an internal antiseptic; *Quassia*, an appetizer; *Iron*, to enrich the blood, and other valuable ingredients, all well known and recommended by the highest medical and veterinary authorities.

Perhaps the strongest argument in favor of Pan-a-ce-a is the fact that it has been on the market for 22 years and is growing in favor each year. Read the guarantee in the right-hand panel—that is your protection.

There is a Dr. Hess dealer in your town, a man whom you know, a man who stands back of my guarantee and will return your money if Pan-a-ce-a fails to make good. 1½ lbs. 25c; 5 lbs. 60c; 25-lb. pail, $2.50 (except in Canada and the far West).

DR. HESS & CLARK, Ashland, Ohio

My Guarantee

So sure am I that Dr. Hess Poultry Pan-a-ce-a will help make your poultry healthy, help make your hens lay and your chicks grow that I have told my dealer in your town to supply you on condition that if Pan-a-ce-a does not do as I claim, return the empty package and get your money back.

Dr. Hess Stock Tonic

25-lb. pail, $1.60; 100-lb. sack, $5.00

Why pay the peddler twice my price?

Your stock need this tonic now to harden and condition them after the confined heavy feeding of winter. There's nothing better to put horses in trim for hard spring and summer work. Milch cows need it just now to prepare them for the heavy milking season ahead. Dr. Hess Stock Tonic makes all stock healthy, keeps them toned up and expels worms. Sold under money-back guarantee. 25-lb. pail, $1.60; 100-lb. sack, $5.00; smaller packages as low as 50c (except in Canada and the far West and the South). Send 2c for my *new* free Stock Tonic book.

Dr. Hess Instant Louse Killer

Kills lice on poultry and all farm stock. Dust the hens and sprinkle it in the nests, or, if your fowl are provided with a dust bath, sprinkle Instant Louse Killer in the dust bath every other week—the hens will do the rest. Also destroys bugs on cucumber, squash and melon vines, slugs on rose bushes, etc. Comes in handy, sifting-top cans. 1 lb. 25c; 3 lbs. 60c (except in Canada and the far West). I guarantee it.

Gilbert Hess M.D., D.V.S.

FREE

If you have a sick or injured animal, write Dr. Hess, tell symptoms, enclose 2c stamp for reply, and he will send you a prescription and letter of advice free of charge.

Pullman $740

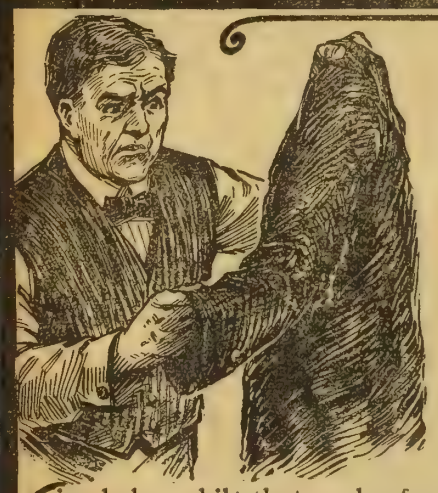
The Great Big Car For The Farm

COMFORT is the keynote upon which the body was designed---plenty of knee room in the driver's compartment, ample leg space in the tonneau and wide seats. Real leather upholstery over real curled hair creates an easy chair of the road. Perfect balance and smooth, easy-running qualities are insured by the famous cantilever springs of the English Lanchester type. The rakish lines, the simplicity in construction, the continuous satisfactory performance, all give to a Pullman owner a marvelous value for the money. There is no other car on the market today that wears as well.

SPECIFICATIONS: 114-inch wheel base; 32-H. P. four-cylinder motor; Batavia non-skid tires on all four wheels; cantilever rear springs; Independent electric starting and lighting systems; separate high-tension magneto; honeycomb radiator; full floating rear axle.

Write Dept. 5

Pullman Motor Car Co. York, Pa.



Pure Wool Costs Money

in a Coat or a Blanket

IT'S very much easier to buy goods which contain a little cotton or shoddy, and they look just as well at first.

The difference shows up in the wear. The cheap garment soon wears shiny, then threadbare, then shows gaping holes, while that made of pure wool is practically as good as new.

It's just the same with Pure Iron for Road Culverts or other uses in which it is exposed to the elements. After cheaper material has rusted to failure, "Armco" (American Ingot) Iron will still be strong and sound—good for long years of service.

"ARMCO" IRON CORRUGATED CULVERTS

are made from the purest, most even, and most durable iron on the market. Look for the Triangle Brand. **It is** your guarantee of service value.

For full information on "Armco" Iron Culverts, Flumes, Sheets, Roofing and Formed Products write

ARMCO IRON CULVERT MFRS. ASSOCIATION

CINCINNATI, OHIO

In and Around Wisconsin

Breeders' Associations Plan Their Annual Meetings —Little Items of Interest Culled For the Farmers.

Carl B. Reddelien, of North Lake, Waukesha county, recently sold his entire herd of sixty-six pure-bred Holsteins to the Carnation Stock Farms at Oconomowoc.

The annual meeting of the Barron County Holstein Breeders' Association will be held Saturday, February 26th, at the court house at Barron and all breeders are invited to attend. The association is rapidly gaining in membership.

The Central Wisconsin Fair Circuit, which at present embraces the fairs at Marshfield, Merrill, Wausau, Stevens Point, Chippewa Falls, Augusta and La Crosse, will probably be enlarged to include Mondovi this year. Final action is to be taken at a meeting of the directors soon.

The annual meeting of the Sheboygan County Holstein Breeders' Association will be held at Plymouth on Saturday, March 11th, and all dairymen, as well as Holstein breeders, are invited to attend. Commissioner Norgord, of the department of agriculture, will be the principal speaker.

Barron county farms which have been registered recently include the following:

Berg Valla Farm, Gust Peterson.
Balsam Grove Farm, John Larson.
Chinquak Park, William Halvorson.
Hill View Dairy Farm, A. L. Gumbert.
North View City Farm, A. F. Gumm.
Prairie Lake Farm, F. C. Durkee.
Star Ranch, C. E. Hinkle.

The Clark County Agricultural Society at the recent annual meeting decided to eliminate the outside race horses at this year's fair at Neillsville and have only home and farm horse races. A. A. Huckstead was elected president; J. W. Hommel, vice president; John P. Kintzele, treasurer, and Myron E. Wilding, secretary.

Door County Fair officials have opened their fair to the residents of Kewaunee county, which does not hold a fair, and this year Kewaunee county farmers can compete at the fair at Sturgeon Bay with Door county residents. The dates are September 19th-22d. One day will be set aside as Kewaunee day.

Farmers in the vicinity of Vesper, Wood county, met recently and organized a farmers' club, to be known as the Farmers' Advancement Club, with nineteen members. John TenPas was elected president; J. Overset, vice president; J. Hubrectse, secretary; Ben TenPas, treasurer, and G. Greenaway, manager.

The annual report of the Emerald creamery, St. Croix county, shows the following facts:

Number of patrons	169
Cream received, pounds	966,293
Average test	24.364%
Butter fat from cream, pounds	235,427
Butter made, pounds	289,565
Overrun, 54,138 pounds, or	22.9956%
Average price paid for butter fat	31 35-46c
Average price paid per pound	3041138

The New Richmond Cheese and Dairy Factory at New Richmond paid its cheese patrons in 1915 an average of 33.81 cents per pound for butter fat and received an average price of 13.87 cents for its cheese. The total cheese production was 155,082 pounds. Butter patrons were paid an average of 29.09 cents for their butter fat and the factory received an average of 27.6 cents for its butter. Total pounds of butter made was 40,427. At the recent annual meeting the proposition to establish a co-operative laundry was discussed, but no definite action was taken.

The advantage of growing certified seed potatoes has been illustrated this winter in Barron county where the 4,200 bushels of certified seed have been disposed of at double the market price. A carload has just been contracted for at $1.25 a bushel. This carload goes to North Yakima, Wash. Other growers have disposed of their seed at from $1.10 to $1.25 per bushel and it is estimated that the entire certified seed crop sold at an average of $1.15. As the average market price at Barron during the winter was about 50 cents for potatoes the value of growing certified seed is visible.

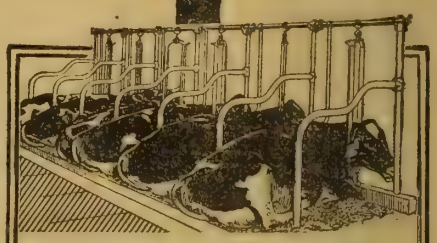
Sauk county farmers are endeavoring to organize a cow-testing association in the vicinity of Baraboo and already seven farmers with seventy-nine cows have signed up. About 400 cows are required to make it a paying and successful proposition. H. E. Taylor, of the Baraboo schools, is behind the movement, assisted by organizers from the state dairymen's association.

Improvements in the poultry building and the agricultural building have been ordered by the Walworth County Agricultural Society and will be completed before the 1916 fair at Elkhorn, the dates of which are September 19th-22d. This action was taken at a recent meeting of the society which also discussed a corn-growing contest for boys in order to increase interest in corn growing. Charles L. Turner was named superintendent of the cattle and sheep divisions; Charles O'Keefe superintendent of horses; Henry Dunbar of swine and Percy Cowles of poultry.

Wood County Cow-Testing Association No. 2 was organized recently at a meeting at Grand Rapids with William Burhopp as president; Porter H rney as secretary, and Ed Caan as treasurer. This is the second association for that county and was organized by W. W. Clark, of the county agricultural school. The membership includes thirty-two farmers with 420 cows. William Bassler is tester. It is proposed to form a third county association this spring for the Pittsville district.

Wisconsin has four tomato canning factories using the product of about 300 acres of tomatoes annually.

$4.75 For This JAMES Stall



INCREASE your barn profits—save labor and time—by putting in the great line of JAMES Sanitary Equipment. Prices are within reach of all.

Stalls for $4.75 each—same as the $10 stalls except on the latter some special features are added—include same steel piping used in all JAMES stalls; square horizontal pipe to hold dust-proof fittings securely; Triple Curve Stall Partition; stall post anchors for easy installation; JAMES stanchion with cow-proof lock of door-knob type, lock open clip, everlasting hinge, Double Chain Hanger with flat links, wood lining; baked-on enamel finish. Shipped assembled, knocked down for easy handling and erection.

JAMES line includes celebrated Stalls; Stanchions, Pens, Carriers, Ventilators, Watering Buckets, etc., designed and built by originators of sanitary barn equipment ideas.

Tell us how many cows you own and when you expect to build a new barn or remodel the old one, and receive free book, "The James Way," showing how to build and equip a dairy barn. Write today.

Raising Blue Ribbon Grains.

Pure Breeding as Important as in Live Stock---By Herman T. Draheim, of Gotham, Wis., Who Has Many Blue Ribbons.

THERE are many different ways of growing proper grains for exhibition, but from my own experience I found it necessary to first study the soil and sow the seed that is best adapted for your soil and climate. Now, there is just as much difference in pure-bred seed grain and common varieties of seed grain as there is in pure-bred stock and the common variety of stock. I don't think any exhibitor would try to improve his stock with a scrub sire or try to improve his seed with common variety of seed grain; and I would advise every exhibitor to grow nothing but pure-bred seed grain.

H. T. DRAHEIM, Gotham, Wis.

Then how to prepare the soil. Now, you all know what rotation farming means. It is clover, corn, oats and barley, three crops in all. I do all my plowing in the fall for small grain. In the spring give a light disking, harrow several times, clean your grain and treat for smut, then sow it with a drill, then go over the ground with a planker or roller, as this will crush all the bumps and leaves a fine dust mulch. You will be surprised to see how even the grain will come up and also how even it will grow until harvest time. I cut when ripe, not too ripe, as grain will crinkle and shell out. When shocking always make a long shock. A dozen bundles is plenty. Some prefer a round shock, but I have found in wet weather the long shock dries out better and will not get moldy or color your grain as quickly as the round shock.

Stacking is very important. Also see that grain is fit, as it will heat and also color your grain. After proper care has been taken with your grains you will be surprised to see how bright the grain is. Now, I am sure every exhibitor feels proud of his blue ribbons and they mean as much to him as A. R. O. records do to a stock breeder. I think every farmer should exhibit grain at the county fair and at the annual grain show at Madison. It gives the exhibitors a chance to study the true types of corn; also the prize-winning grain and sheaves. Now, if you win blue ribbons it is a good boost for your community. Then when these samples win at national grain shows it is a bigger boost for your state and shows we appreciate the work done by the agronomy department for developing these pure-bred seed grains which are carrying off the highest honors wherever exhibited.

Now, about growing corn for exhibition, it is rather a hard proposition and is something that cannot be accomplished in a few years. I think there isn't any variety of seed neglected so much as corn. A great many farmers get in a hurry about planting time and neglect to do the work properly. About half of the corn will come up, then they will replant with almost any kind of corn, whether it is Flint or what, they are not very particular and expect good corn. Such corn will get mixed and not mature even. Some will be ripe, others dented, while some may have a small nubben. Now start right. Don't think just because you grow white corn it is the true type of Silver King (No. 7). I am sure you would not think just because you owned a cow that had black and white spots that she was a pure-bred Holstein and a typical type of a dairy cow. First get the true type and plant the variety that is best adapted for your climate. Plant on manured clover sod, plow and give a double disking, good harrowing and plank before planting. This will leave the ground smooth and even. Have every ear tested. Then plant, wait a few days, then drag again, as this will break the crust that forms after rains. Dragging will help while the corn is small. First time cultivate rather deep. Then after shallow cultivation. When your corn is ripe select from the stalk only the very best ears. Then take a ten-ear sample and enter at your county fair or grain show. Don't expect a blue ribbon the first thing or be disappointed if you don't get one, for there's glory in defeat also. From the first exhibit you will get interested. The following year plant a few ears in a special seed plot or ear-to-the-row method. Any way to grow prize-winning corn, and you will wonder that there is more to learn every year. I hope you readers will not think me a book farmer, but this is the method I used on growing the grain that won the most blue ribbons at the annual grain show last year.

WHY A "LEVEL" ADJUSTMENT CHANGES.

To the Editor:—I noticed in a recent issue of your paper mention made of leveling with a cheap farm level. The party stated that when he left same standing for a while, on returning found the bubble had run off to one end of the tube. That is, the level on being set would not stay in a perfect condition or the same as set. This, you will find, is due to the fact that in winter time the ground thaws under the feet of the tripod at irregular intervals. For instance, as the sun comes out from under a cloud the tripod will settle enough to run the bubble off. Then again, when the sun stays under the clouds you will experience no trouble with the bubble running off.

It may be that with the cheaper grades of levels, as the one under consideration, will be moved enough by this effect of thawing under the tripod to make a difference in the levels.

I have never experienced any trouble with a difference in the levels unless under extreme conditions where I was obliged to leave the level standing in one position for a long time, or where the thawing was extreme in itself. T. Harold Knight.

John Deere Plows for Light Tractors
High and Level Lift

PRACTICAL—the right size for the average farm. Work with any standard tractor. Controlled by the man on the tractor.

Pull the rope and all bottoms raise high and level. Another pull lets them down. Plows do not clog or gather trash on the turn.

Extra beam and bottom, readily attached, increases regular two bottom plow to three, or regular three bottom to four, as desired.

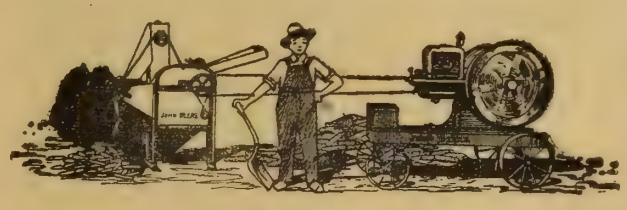
Equipped with Quick Detachable Shares—save 80% time changing shares. Write for free booklet.

John Deere Disc Harrow
The Flexible Spring Pressure Disc

MODEL B—the only disc that cuts at even depth its entire width. It has a patented spring pressure lever. With this lever, pressure can be regulated at inner ends of gangs to cut out dead furrows or disc ridges without burying the harrow.

The Model "B" does not crowd toward the bottom on hillsides or in overlapping. The gangs are independent of each other and can be given the proper angle to work right under such conditions.

Write for free booklet, "Bigger Crops from Better Seed Beds."



R. & V. Engines
Dependable Farm Power

"R & V" Triumph—always develops rated horse power—made in 1, 1½, 2½, 4, 6, 8, 10, 12, 16 and 20 H. P. sizes, stationary and portable.

Easily started; perfect speed control (speed can be varied 40 per cent without stopping engine). Complies with insurance regulations. Hopper cooled—a simple, efficient system that does not require long pipes and numerous fittings.

High grade throughout. Inspect the extra guard ring over piston pin to prevent possibility of scoring cylinder. Ask about the "R & V" oscillating magneto. Write for free booklet.

John Deere Grain Binder
With All Steel Quick Turn Tongue Truck

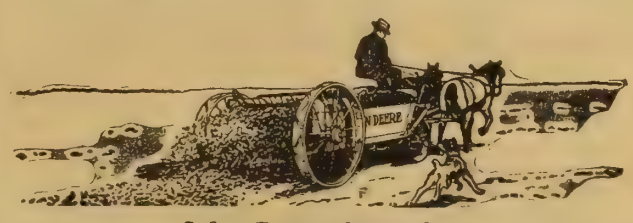
THE Better Binder—The first binder to be equipped with a practical all-steel quick-turn tongue truck. The advantages are:

1st—Truck turns machine faster than team turns. This saves time in turning, square corners are made, and full swaths taken at the turns.

2nd—Stub tongue is all steel, hot riveted—no breaking, splitting or rotting. All steel eveners.

The binder that is noted for its light draft, sure cutting, elevating and tying.

Write for free booklet, "The Better Binder."



John Deere Spreader
The Spreader with the Beater on the Axle

ONLY hip high to the top. Wheels out of way when loading. Mounting the beater on the axle is patented. Write for Spreader booklet.

Three exclusive John Deere Spreader features:

[1] Beater on the axle—nothing else like it. [1]

[2] Revolving Rake—load moving back to beater revolves the rake. Draft actually less. Even spread certain—no bunching. [2]

[3] Ball Bearing Eccentric Apron Drive—requires no attention. Performs wonders in the working of the spreader. [3]

Dain System Side Rake
The Left Hand Rake

THE tool that is revolutionizing hay making. Left hand instead of right—follows the mower closely, places hay upon clean stubble and puts it in medium size windrows with bulk of leaves inside and majority of stems outside.

This means uniform curing and leaves don't dry up and fall off. They cure in the shade.

Hay is air-cured, not sun-scorched, retains its color, nutrition, feeding value and sells for more money.

Write for free booklet describing the Dain System of Air Curing Hay.

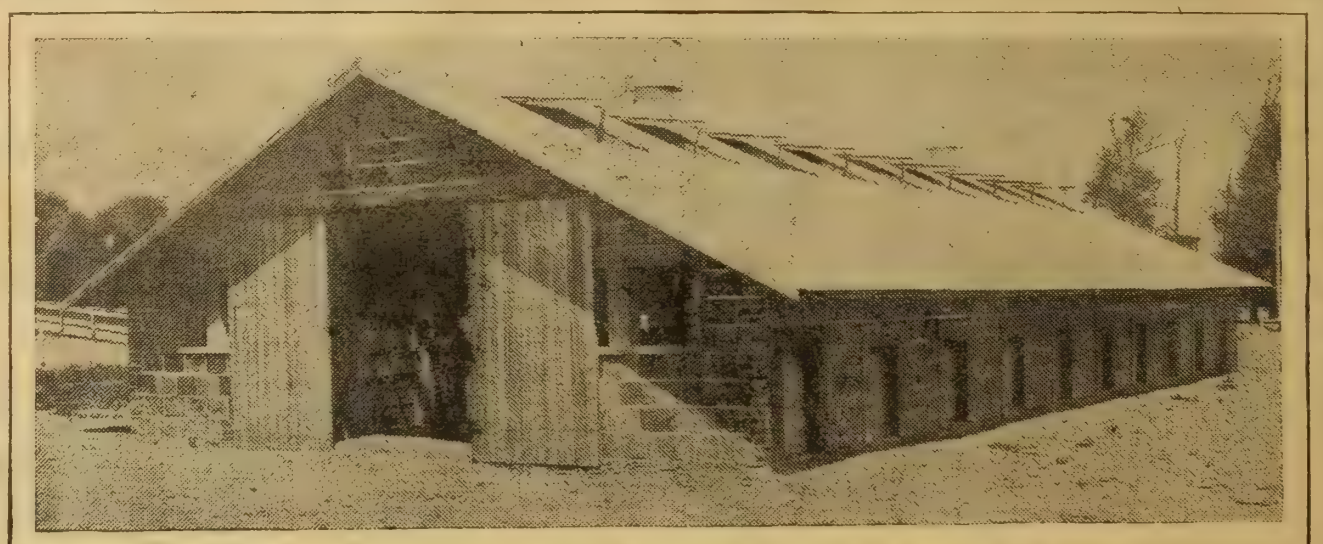
CAFETERIA PLAN FOR HOGS.

Mr. John Evvard Has Aroused Considerable Interest Among Wisconsin Hog Men by His Free-Choice System of Feeding---Results of His Experiments Interesting.

ONE of the most interesting addresses at Madison Farm and Home Week was by Mr. John Evvard, of the Iowa station, on the free-choice plan of swine feeding. Mr. Evvard takes the position that an enormous amount of labor may be saved in the feeding of swine, and, further, that there may be a material cutting down in the cost of pork production if the methods which he outlines are adopted by swine breeders. The dropping of slop alone from the bill of fare means the removal of one of the most laborious items of choring in farm operations. In a series of experiments outlined and supervised by Professors Pew and Evvard, of the Iowa station, it has been demonstrated over and over again that the most rapid and cheapest gains can be made when hogs have free access to grain as well as to concentrates, these being fed in dry form from self-feeders.



SUN-LIT HOG HOUSE DESIGNED AND PERFECTED BY IOWA EXPERIMENT STATION—WARM, DRY, WELL-VENTILATED, SANITARY AND SUNNY.

The writer visited the Iowa station some weeks ago and found 400 pigs on feed and the outcome of an extensive series of experiments will, we predict, establish and fix forever certain principles of feeding swine that have heretofore been unheeded. It has been found, among other things, that blue grass is not an economical feed unless accompanied by a liberal grain ration. Pigs weighing an average of forty-one pounds on June 18th were turned into a good blue grass pasture and fed one pound of corn daily and about one-tenth of a pound of tankage for each 100 pounds of live weight. Four months later these pigs weighed seventy-two pounds. It required 407 pounds of corn and tankage for 100 pounds of gain made. On the other hand, pigs of the same initial weight, namely, forty-one pounds, fed exactly the same length of time as the first lot, having free access to corn and tankage in separate feeders, weighed 204 pounds each. In other words, they were 132 pounds heavier than the lot fed the small-grain ration, and, furthermore, they made their gains at a lower cost, as it required but 369 pounds of corn and tankage to make 100 pounds of increase in weight. Remember that each lot had a continuous full ration of blue grass. Where hogs were fed three pounds of corn per 100 pounds of live weight during the grazing period they weighed 141 pounds, whereas hogs full fed twice daily on corn and tankage weighed 185 pounds. Even full feeding twice daily failed to produce the fine results accomplished by the self-feeder, as the hogs were nineteen pounds lighter than the self-fed group. Comparing, now, the cost of grain in the case of the lot fed one pound of grain to each 100 pounds of live weight with that of the self-fed lot, we find that in the former instance it was $7.41 per 100 pounds and in the latter $5.04. Corn is computed at 70 cents a bushel and tankage at $2.50 per 100 pounds, but even at these prices the more corn you can feed to hogs on blue grass the greater will be the gains and the less the cost and the larger the profits per pig. Mr. Evvard says that he has convincing proof that if you want to use blue grass as a pasture and feed corn and tankage so as to make 200-pound pigs in the least time with the least labor and at the lowest cost look to the self-feeder for the inspiration and the means.

It is one thing to allow hogs to balance their own ration when they have access to grass and plenty of exercise, but it might seem to be quite a different thing if they are dry-lot fed. This is a matter that has also been well threshed out by Mr. Evvard. Seven groups of hogs were placed on different rations at the weight of forty-two pounds. At the end of a 100-day feeding period it was found that the hogs having access to shelled corn, wheat middlings and tankage weighed 155 pounds. In the making of 100 pounds of gain they consumed 300 pounds of shelled corn, fifty-three pounds of wheat middlings and fifty-five pounds of tankage, or a total consumption of 408 pounds. This made the cost of the gain, at prevailing prices, $5.90 per 100 pounds. Hogs given the same ration, but fed three times a day instead of having continuous access to the grain, made 100 pounds of gain at a cost of $6.07. When they were fed twice a day it cost $6.35. In the latter case, however, the hogs only weighed 137 pounds at the end of the 100-day feeding period, whereas the free-choice lot weighed 155 pounds. Four other lots were fed in accordance with well-known feeding standards, but in every instance they fell far behind the free-choice lot in the daily gains made and the increase in weight was made at a greater cost than were the gains in the case of the free-choice lot. The result of this dry-lot experiment indicates that the ration the pigs select themselves will produce larger gains and cheaper gains than will result from the feeding of foods selected by men be they ever so skilfully standardized.

SELF-FED GILTS DEVELOP INTO PROFITABLE BREEDING STOCK.

In the case of hogs having access to alfalfa pasture, the supplying of grain by the self-feeder system gave most satisfactory results. Hogs weighing forty-one pounds when turned into alfalfa made an average gain of .62 pound when fed one pound of corn to each 100 pounds of live weight. When similar hogs were fed three pounds of corn to 100 pounds of live weight they made an average daily gain of .95 pound, while hogs having access to the self-feeder made an average daily gain of 1.19 pounds. At the end of a feeding period lasting 120 days the hogs fed the so-called 1 per cent ration weighed 116 pounds, those fed the 3 per cent ration or three pounds of grain for each 100 pounds of weight, weighed 155 pounds, while the lot fed corn with a self-feeder weighed 185 pounds. The cost of the grain in making 100 pounds of gain was the smallest where the least corn was fed, namely, $4.15 per 100 pounds, and the largest in the case of the self-feeder, which was $4.79 per 100 pounds. The fact must not be lost sight of, however, that the hogs having access to the self-feeder were sixty-nine pounds heavier than those fed lightly on corn, and, therefore, they were just that much nearer the marketing period. It follows, naturally, that it costs more to make a pound of gain on a heavy hog than on a light one, so that by the time hogs weighing 116 pounds are brought up to the weight of the self-fed lot, namely, 185 pounds, their gains will even run higher than the self-fed lot. All things considered, therefore, the most profit per pig running on alfalfa in a given time is secured, under ordinary conditions, with a full feed grain ration. The gains are more rapid, and, in the case of spring pigs, they are ready for market early when prices, on the average, are higher. Then there is the saving of labor that is effected by early marketing and the advantage of getting rid of the hogs before they need expensive shelter.

It will be noticed that in every instance the hog gives the best results from the food consumed when he is allowed to make his own choice. The hand of man is apparently not required in the mixing, as the needs and requirements of the animal seem to be most economically met when free choice is allowed. The young pig requires considerable protein and early in life the high-priced concentrates are used freely. Later on, as weight increases, there is a rapid falling off in the amount of protein consumed and an increase in the amount of fat-forming foods required. This means that, considering the whole feeding period,

(Concluded on page 25.)

HOGS IN GROUP TO LEFT, PASTURED ON BLUE GRASS AND SELF-FED ON CORN AND TANKAGE, AT SIX AND A HALF MONTHS WEIGHED 204 POUNDS, WHILE THE GROUP TO RIGHT, PASTURED ON BLUE GRASS AND 1 PER CENT CORN RATION, WEIGHED SEVENTY-TWO POUNDS AT SAME AGE.

Stop! Look! Listen!

Wonderful Stump Puller-Special Price

Just What You Have Been Looking For

Why pull stumps by hand power? Let the horses do the work. Save yourself back-breaking labor, time and money with this wonderful stump puller.

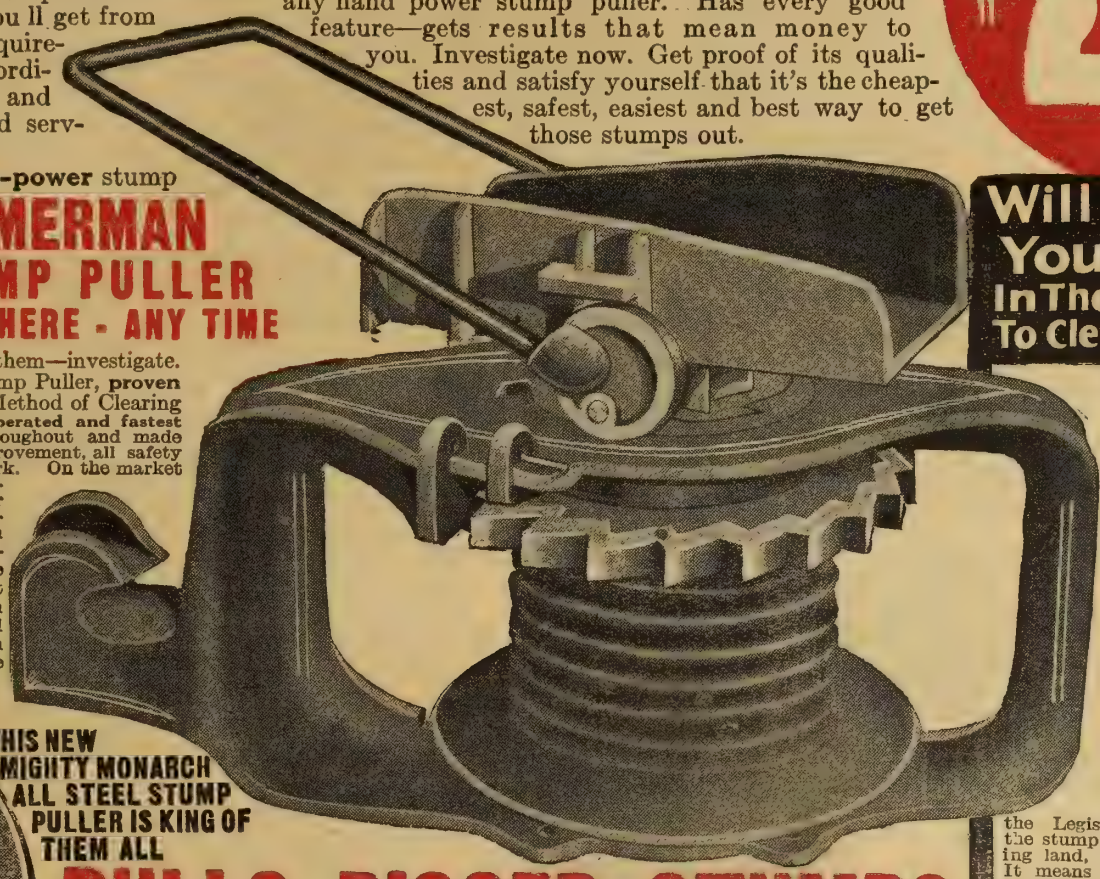
Biggest value ever offered in a stump machine—more service per dollar of cost than you ll get from any other. Meets all your requirements—just what you want for ordinary stumps. Strong, safe, sure and fast in operation. Practical and serviceabl

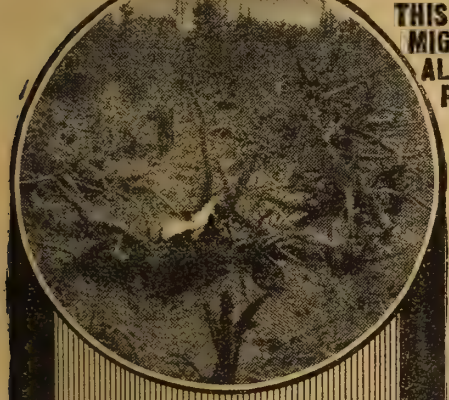
Your opportunity to get a **horse-power** stump puller at a real bargain price. This machine takes the place of the old-style, slow-action, man-killing hand pullers. Made to pull stumps any place, any time with one horse. Can be used as a hand machine if desired and works as easy and as fast as any hand power stump puller. Has every good feature—gets results that mean money to you. Investigate now. Get proof of its qualities and satisfy yourself that it's the cheapest, safest, easiest and best way to get those stumps out.

$22

THIS NEW ZIMMERMAN ALL STEEL STUMP PULLER FOR ALL WORK - ANYWHERE - ANY TIME

If you have large stumps, many of them—investigate. The famous Mighty Monarch Steel Stump Puller, **proven and recognized** as the World's Best Method of Clearing stump land. **Strongest, safest, easiest operated and fastest stump puller on earth.** Made of steel throughout and made absolutely right. Has every modern improvement, all safety devices and is made in all sizes for any work. On the market 20 years—40,000 satisfied users. Unbreakable in service and dependable for lifetime satisfaction. So simple in operation and so safe that a child can handle it. Pulls stumps roots and all—200 to 600 of them per day. Note the large bearings, long anchor hook and deep ratchet teeth. This Mighty Monarch can be thrown out of gear with a full load on the cable and is the only machine made with a friction brake on the drum operated by the same lever used to throw it in and out of gear.





THIS NEW MIGHTY MONARCH ALL STEEL STUMP PULLER IS KING OF THEM ALL

PULLS BIGGER STUMPS CHEAPER, FASTER, EASIER—WE PROVE IT

The New Zimmerman Mighty Monarch Steel Stump Puller pulls all the stumps—big or little—from any soil. Pulls them faster than any other stump puller can. Pulls them easier and at less expense. Cheaper to use than dynamite and safer than any other method. Clears land at one operation—gets roots out and saves grubbing. This World famous stump puller will pull stumps with triple power over an area of more than two acres with 200 feet of cable at one setting. Holds the World's record for speed, power and economy.

We'll prove these statements—every one of them—at the first Mighty Monarch demonstration in your community. Don't fail to see it—you'll learn things about clearing with modern methods that you never dreamed of.

GET CATALOG AND BOOK ON LAND CLEARNG---THE REAL FACTS

Fill out coupon below and mail to us today. Get our big Catalog and Land Clearing Book—worth money to you. Tells all about Mighty Monarch Stump Pullers—all sizes and prices. Shows how they are made and why they're "Best On Earth." Fully illustrated with pictures of clearing scenes all over the country and showing the Mighty Monarch at work. Describes full line of high grade clearing accessories and complete modern equipment. This book is free to you—write for it.

SPECIAL: GOOD TERRITORY OPEN FOR DEALERS

Big chance for active dealers. We want representatives in all open territory to supply our customers with Mighty Monarch Stump Pullers. Thousands of land owners want them now and the demand is increasing as state campaigns for more cleared land progress. Write for our big, new advertising and sales plan and complete plan of dealer co-operation to show stump land owners the big value of Mighty Monarch Clearing Methods. Public competitive demonstrations to be held by all our dealers. Let us tell you about it.

ZIMMERMAN STEEL COMPANY

DEPT. W 8 BETTENDORF, IOWA

Will You Help Your State In Their Campaign To Clear Stump Land?

The success of the big campaign now on in this state to get the land cleared and under the plow depends on the stump land owners. That means you.

Are you interested in the prosperity of your state? In its crop returns, land values and future place among producing states? Do you want to see better times, more money in circulation and more settlers about you?

The State Agricultural Schools, Agricultural Experts and practical farmers are all boosting for land clearing right now. Bankers, influential business men and members of the Legislature are urging the land owner to clear his land, and some official action from the Legislature is expected. Clearing the stump land means more producing land, more crops, more money. It means permanent prosperity for the state at large and every individual community.

Help this good cause along. Clear your land now. Get the stumps out and grow crops and make money from the land. One crop from new land will pay for the cost of clearing with a Mighty Monarch Stump Puller—every year after that is net profit.

AOT NOW

Get the Mighty Monarch Book and learn how to clear land cheaply, safely and easily.

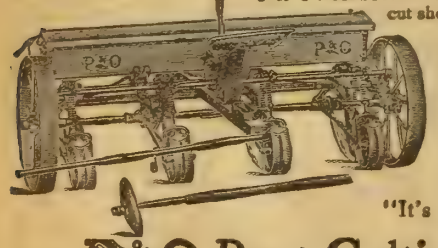
P&O Sugar Beet Implements

P&O Beet Seeders

P&O Four Row Beet Seeder



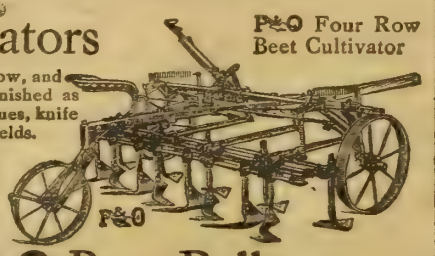
P & O Beet Seeders are up to date in every respect. The accompanying cut shows the regular equipment. The feed mechanism can be adjusted to plant any quantity desired. All cups are adjusted at once. Large seed capacity. Press wheels have open center, concave tires.

Can be furnished for planting in rows 16, 18 and 20 inches, or 18, 20 and 22 inches apart, as ordered. Openers and press wheels can be raised or lowered together, or independently. Can be equipped with an efficient Fertilizer Attachment; also an Irrigating Attachment.

"It's the Way We Build Them."

P&O Beet Cultivators

P&O Four Row Beet Cultivator

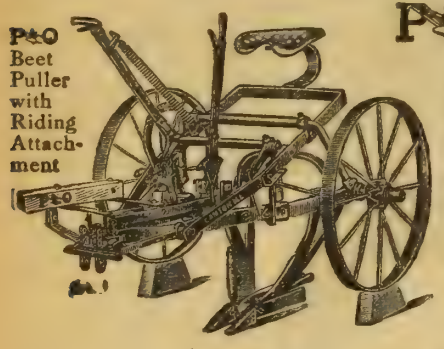


P & O Beet Cultivators are made in two and four row, and can be equipped to meet varying conditions. Furnished as shown, or with irrigating shovels, duck feet, deer tongues, knife weeders, disc weeders, spiders, crust breakers and shields.

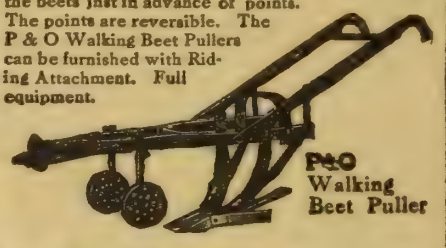
Fine depth and leveling adjustment. Adjustable for rows 16, 18 and 20 inches apart, or 18, 20 and 22 inches apart, as ordered. Noted everywhere for simplicity of construction, great strength, and ease of operation, the hall marks of P & O excellence.

P&O Beet Pullers

P&O Beet Puller with Riding Attachment



Walking or Riding. The P & O Riding Beet Puller is the only one on which the operator sees the beets just in advance of points. The points are reversible. The P & O Walking Beet Pullers can be furnished with Riding Attachment. Full equipment.



P&O Walking Beet Puller

We make a full line of implements for the Beet Grower.

Our pamphlet, "Sugar Beet Implements," describes them. Write for it.

CURRENT EVENTS

THE republican national campaign will be waged as a fight for adequate military preparedness and tariff reform, opposition to granting early independence to the Philippines and insistence of a vigorous stand for American rights, both in Mexico and in relation to the European war. Such were the keynotes sounded at the republican state convention in New York last week, plainly intended for adoption on a national scale when the proper time comes. These keynotes were first sounded by Elihu Root, chairman of the convention, who was temporary chairman of the republican national convention four years ago, which nominated Taft for the presidency for a second term. The big fight of the convention was over the instruction of the delegates to the national nominating convention. Notwithstanding every effort on the part of Governor Whitman and his supporters, the delegates were left uninstructed, so that should the name of Justice Hughes be presented the New York delegates will be free to support him, instead of Governor Whitman or any other candidate. After a fight which lasted four hours the committee on delegates finally agreed on United States Senator James Wadsworth, Jr., Charles S. Whitman, Frederick C. Tanner and Elon B. Brown, republican leader in the state senate. As Wadsworth, Tanner and Brown are reputed anti-Whitman men the committee's decision was accepted as a defeat for Governor Whitman.

REPORTS have been rife the past few days that Germany had offered to make a separate peace with Belgium, agreeing to withdraw all troops and restore Belgium to its king and government, the only provision being that Belgium should absolutely prohibit the allied troops from marching across its territory to attack Germany after the German troops were withdrawn. In short, Germany would have Belgium maintain the strict neutrality which it violated when it invaded that country immediately after the outbreak of the war. Whether or not Belgium is considering the matter seriously (whether, in fact, Germany has made such an offer) is not now definitely known. The ministers of the allies are known, however, to have informed the Belgian government that hostilities against the Teutons and their allies will not be permitted to end without Belgium having re-established its political and economical independence. They added that the Belgian government would also be called upon to take part in the peace negotiations.

GERMANY has issued formal notice to the world that after March 1st all armed belligerent merchantmen will be considered and treated as warships. This means that any vessel of England, France or any other enemy nation which carries freight or passengers or both, but which has a mounted gun for protection, will be attacked and disabled or sunk, the same as though it were a regular war vessel the purpose of which was to engage in battle at the first sight of the enemy. While making this formal announcement, Germany reiterates that it will abide by its promise to President Wilson and that unarmed passenger ships will not be sunk without warning and without ample time being given to allow the passengers to get to safety. Carrying a cannon or guns is to be the test of whether a shipping vessel is to be attacked and sunk, according to the new rule, which goes into effect next week. While Germany is assuming this new attitude, announcing an early resumption of its submarine activities, the United States virtually helps it in its new course by announcing the possibility of action on our part which will bar armed merchantmen from American ports except as they may put in, like war vessels, to remain a stipulated time for coal, provisions or repairs, after which they must leave or be interned for the remainder of the war. There is talk of congress going still further and warning Americans that they must not take passage on liners that are armed or lose their right to the protection of the Stars and Stripes if they insist upon doing so. If the administration refuses to warn Americans to keep off armed liners there will be a demand in the senate for the immediate passage of the Gore bills prohibiting Americans from taking passage on vessels of belligerent nationality. There already is close to a majority of the senate in favor of such legislation and it is not improbable that the situation produced by the administration and the German government will serve to increase the support of the Gore measures.

NOW that the plan of former Secretary Garrison for the creation of a continental army is doomed to defeat, proposals have been made by the National Guard Association for the federalization of the state troops. Under the proposed plan an enlistment contract would be required of the national guardsman by which he would bind himself to serve the federal government "within or without the continental limits of the United States" for a period of two years, or until discharged, should the guard be called out at any time during his three-year enlistment period. At least forty-eight drills a year and participation in annual field maneuvers would be required. The maximum number of troops provided for is 500 for each congressional district, or a total peace strength of approximately 200,000, an increase of 70,000 over the present strength of the national guard. They would form a separate branch of the regular army in time of war when called into the federal service. The act would take effect July 1, 1916. Heretofore the national guard has been solely and exclusively a state body of troops, with no federal authority or supervision. There is a growing conviction that to get the best results the national government must be the supreme power, instead of forty-eight separate state governments. One of the reforms that seems likely to be adopted, as a result of the preparedness talk, is this proposed change in the organization, supervision and duties of the national guards of the various states.

JOHN T. TROWBRIDGE, poet and author of stories for boys, whose name was a household word a third of a century ago, died last week at his home in Massachusetts, in his ninetieth year. It was sixty-three years ago that Mr. Trowbridge gave to the youth of an earlier generation "Father Brighthopes," the first of a long series of books that included "Neighbor Jackwood," "The Pocket Rifle," "Cudjo's Cave," and ended with "A Pair of Madcaps" in 1909. Mr. Trowbridge was one of the last survivors of the group of authors who made Boston a famous literary center in the first three decades of the last half of the nineteenth century. Perhaps the best known of Mr. Trowbridge's verse is the humorous poem, "Darius Green and His Flying Machine," written in 1870. When, forty years later, he first saw an aeroplane in action, he remarked: "I never dreamed when I wrote that poem that such a thing as a flying machine was even a possibility in my lifetime."

HORSE OWNERS

IF you have colts to break or if you have a kicker, shyer, runaway or otherwise unmanageable horse that you are unable to properly break with any other bridle or breaking appliances, **Koepke's Controller Bridle** will do the work in the shortest time with the least possible danger. A perfect breaking and driving bridle. Satisfaction guaranteed or money cheerfully refunded. Write for circulars and prices.

FRANK L. KOEPKE, Whitehall, Wis.

Wisconsin Baby Beef Contest.

Boys Under Twenty Years of Age May Compete for Prizes Offered by Wisconsin Live Stock Breeders' Association.

UNDER the auspices of the Wisconsin Live Stock Breeders' Association, an effort is being made to interest Wisconsin boys in beef cattle. A contest for boys under twenty years of age has just been announced. Prizes will be awarded to boys who show the best baby beef, regardless of breed. The contest will be conducted in conjunction with the county fairs; all winners at these fairs to compete in a state show to be held at Madison, November 22 and 23, 1916. Prizes will be awarded at Madison, ranging from $50 for first prize down to $4 for fifteenth prize. Four fairs—the Grant County Fair at Lancaster, the Iowa County Fair at Mineral Point, the Richland County Fair at Richland Center, and the Rock County Fair at Janesville—have complied with the rules of the contest and the Lodi Union Fair at Lodi and the Sauk County Fair at Baraboo are expected to come in shortly. It is also believed the Walworth County Fair at Elkhorn and the Interstate Fair at La Crosse will cooperate. The state association has chosen these eight fairs to stage the local contests and if successful this year it will be enlarged and include other fairs in the beef belt next year.

The local fairs will each offer $150 in prizes to the boys within their counties for the best baby beeves shown at their fairs. This will be in addition to the state prizes which will be awarded at the round-up at Madison.

The three winners at each local fair will be required, by the rules of the contest, to exhibit at Madison, but any other fair exhibitor, though beaten at his county fair, may also exhibit at Madison. The state round-up is open to any boy in the state who will condition his beef as set forth in the rules and each exhibitor at the Madison round-up, whether a prize winner or not, will have his transportation charges paid by the state live stock breeders' association.

There will be no entry fee or other expense at the Madison round-up, although the county fair association may make its own regulations.

The contest opens March 1st and entries close April 15th. Steer or heifer calves, any breed, pure bred, grade or cross bred, dropped on or after September 1, 1915, are eligible for entry. Other rules of the contest are:

Each entry must be exhibited at the county fair where entered. Boys must comply with the regular rules of the fair board covering live stock exhibits.

Every boy must feed, groom, break and show his own calf.

No restrictions will be placed upon the kind or amount of feeds fed or the methods of feeding. Each boy will be required to keep a brief feeding record.

Whenever scales are available it will be well to keep a weekly record of weights. The weekly gains of the calf will be a good index to its condition and may suggest that changes of feeding or management are necessary.

The record of feeding will not be considered in the final placing of calves. They will be judged by a competent beef cattle man, from a market standpoint entirely.

The first three prize winners at each county fair contest will be required to exhibit, but all county fair contestants are eligible.

Any boy not winning a cash award will have his transportation expenses paid. Stall room, hay and bedding will be furnished free of charge, but each exhibitor must furnish his own feed.

One judge and two referees will be secured to place the calves. One of these men will be an experienced butcher and meat judge and will have charge of the carcass demonstration after the judging on foot is finished. Commission men, packers' representatives and stock buyers will be present to bid upon the calves which are for sale.

Prize money will be apportioned at the Madison show as follows: First, $50; second, $40; third, $30; fourth, $25; fifth, $20; sixth, $15; seventh, $12.50; eighth, $10; ninth, $7.50; tenth, $5. The eleventh, twelfth, thirteenth, fourteenth and fifteenth prizes will be $4 each.

Each boy must feed, groom, break and show his own entry. A certificate to this effect will be required of parent or guardian.

Each calf must be exhibited at the county fair where entry is made. The first three prize winners at each county fair must exhibit at Madison.

Contestants must comply with all the rules of the fair association covering live stock entries.

No restrictions will be placed upon the kind and amount of feeds or the methods of feeding. The record of feeding must be filed with the Wisconsin Live Stock Breeders' Association.

Contestants are limited to two entries and more than one boy in a family may exhibit.

Interested breeders who have no boys eligible to enter the contest may loan a calf to a neighbor boy. But the boy must make the entry and feed, care for and exhibit the calf.

Calf owners are not obliged to sell their calves, but may dispose of them in any way they may see fit to do.

Misrepresentation in regard to any part of this contest will disqualify the contestant.

Complete information may be secured free by writing the Wisconsin Live Stock Breeders' Association at Madison.

BOYS' AND GIRLS' WEEK AT ST. PAUL.

An unusually attractive program has been arranged for Boys' and Girls' Week at University Farm, St. Paul, Minn., April 3d to 7th. This is the sixth yearly meeting of young farmers at the Minnesota Agricultural College and each year's program has been better than the one that preceded it. Last year 403 attended, and a larger attendance is expected this year.

The mornings of Boys' and Girls' Week will be given over to class study and practice. In the afternoons there will be excursions to places of interest in the Twin Cities—to the state capitol, the new prison at Stillwater, the Russell-Miller Milling Company's mills, the Walker Art Gallery, the Minneapolis Public Library, Minnehaha Falls, the Soldiers' Home and the South St. Paul Stockyards.

County school superintendents report that students who have attended Boys' and Girls' Week take a deeper interest in better farming. They are the ones most eager to enter corn-growing contests and most interested in industrial improvement. Students return home at the end of the week, they say, with a vision of better things and attempt to improve conditions with brighter hopes.

The week is recommended by men at the agricultural school as a fitting close to the agricultural high schools' short courses. Other schools which have opened for the spring term are offering to give credit for time spent at Boys' and Girls' Week.

LAW QUESTIONS.

Farmer Liable for Injuries.

A Subscriber, Toledo, Ill.—I am a farmer and I operate a threshing machine, also a shredder and an ensilage cutter. If I hire a man to work with said machinery and he gets injured while so working, will I be liable to him for damages under the laws of Illinois?

Answer.—You will.

Marriage of Cousins.

A Subscriber, Butterfield, Minn.—I am a young man. My grandmother married three times. My grandfather was her first husband. (1) Am I a cousin to a daughter of a daughter of my grandmother's third marriage? (2) Am I too close of kin to marry a daughter of a daughter of my grandmother's third marriage in the state of Minnesota? (3) Could I lawfully marry her in any other state?

Answer.—(1) The daughter of a daughter of your grandmother by her third marriage is a first cousin of the half blood to you. (2) You are too close of kin to the daughter of the daughter of your grandmother to marry her in Minnesota. (3) You can lawfully marry her in Idaho, New Mexico or California.

Failure to Pay Rent.

A Subscriber, Mankato, Minn.—A rented his farm to B for five years, and holds ten notes of B for the payment of the rent; $300 of each year's rent is to be paid on October 1st of each year, and $600 is to be paid on February 1st of each year. B paid only $100 on the first note and there is not much prospect of his paying the balance of said note. (1) If he makes no further payment, when can A compel B to surrender possession of the farm? (2) If B pays the balance of the first note, and then fails to pay the second note, when can A compel him to quit possession?

Answer.—(1) A can bring a suit against B at once to recover possession of the farm and obtain judgment restoring the possession to A. But at any time before such judgment is rendered B may pay to A the rent due and interest thereon and all the costs of the suit and an attorney fee of $5, and if he does so he may keep possession of the farm, otherwise he will be put off. (2) The same proceedings could be taken if B should pay off the first note and then fail to pay the second note.

Limitation in Oregon.

A Subscriber, Sparta, Wis.—When will a mortgage on real estate in the state of Oregon become outlawed if the interest on the same is kept paid up?

Answer.—In ten years after the last payment of interest. The payment of interest or any part of the principal prevents the debt from becoming outlawed, and the ten-year limitation is counted from the last payment.

Bill of Sale—Deed.

A Subscriber, Waupaca, Wis.—(1) Is a bill of sale between two parties legal in court if such bill is not witnessed or acknowledged before a notary public? (2) Is a bill of sale made on Sunday, but dated a day back, legal? (3) Where a wife's name is Mary D., and her husband's name is Frank D., is a deed made to the wife reading Mrs. Frank D. legal, or must it read to Mrs. Mary D.?

Answer.—(1) Such a bill of sale is legal between the parties and good as evidence in court. (2) It is not. (3) Such a deed is legal and conveys the property to Mary D.

Seduction of Girl.

A Subscriber, Free Soil, Michigan.—About one year ago a man in Iowa seduced his young sister-in-law, and she has a child by him. He promised her if she would not tell her sister about it, he would pay her a large sum of money. He has not complied with his promise. What can be lawfully done about it?

Answer.—The girl can sue him for damages and obtain judgment against him. Also, she can have him prosecuted for the crime of seduction, the penalty for which is imprisonment in the penitentiary not more than five years or in jail not more than one year and a fine not more than $1,000.

Smut in oats causes greater losses in the fields of the United States every year than any other preventable cereal diseased. Hence it must be worth while to study the causes and prevention of smut.

FAVORS THE CONSOLIDATED SCHOOL.

To the Editor:—I read the article you printed in your issue of January 27th against consolidation of schools. Now, I always have considered your paper given to fair dealing and beg to present the other side, as a great many of your readers are for consolidation.

The subject of consolidation is one in which we are greatly interested, as we live outside the village school district and have five children ranging in age from six to fifteen. We were educated first in the country schools, then in the graded school of our village, and, as we live but a short distance either from the village one way or the rural school the other, we have kept in touch with both. We have looked into the methods of the grade schools as conducted in the village school, with its score of teachers, and the country school, with its one teacher, and have decided in favor of the larger school for our family. This at a cost of about $100 more for tuition and hitch barn charges. By consolidating the school the poorest country child can have equal advantages with those of means. I have given this much of personal experience to show I am not speaking at random.

I wish to say here that we have as good rural schools and teachers as anywhere in the state. It is not the fault of the teachers that they cannot give the little lads and lasses the advantages of their cousins, for one teacher cannot hear all the recitations of eight grades in the six hours allotted. In talking with many acquaintances among the rural teachers I find that they all have to use makeshifts to get through and they combine in saying that they haven't time to do the work expected of them now. On top of this their superiors in the educational system ask them to undertake outside work, such as mothers' meetings, sociables, etc. In comparison I do not need to show the advantages to be gained in the larger, centralized schools, do I? Here one teacher would have not over two grades to attend to and can give much more undivided attention, with extra teachers for those who cared to take manual training, sewing or cooking.

I notice that the general opposition is that it is wrong to call the little chap from bed at an early hour in order to catch the school bus. I cannot conceive why any thinking mother will allow her child of five or six to go to school for as long as it has all of God's out-of-doors to play and develop in. Give it a chance to lay a foundation for its health before it starts to school. The child of seven or eight will soon outstrip those who started younger. When these little children are in school the well-cared-for child will still be taking its afternoon nap. As to getting up early, that never hurt a child if it was sent to bed at a proper time instead of sitting up until its parents retired, as is so common.

If your friends object to their children going the route in the bus what is to hinder them hitching up "old Dobbin" and taking them to a consolidated school as well as any other? There is one out of ten of the parents who bother to hitch up "old Dobbin" and the poor kiddies who wade two or three miles through mud or snow would be very glad of a ride in the bus.

As to its unfitting them for life, making them unwilling to do chores and get the dress-and-go habit, there is nothing in it. That lies entirely with the parents and the home life. It is the selfishness entirely that is opposing the consolidated school, the fear that Tommie or Susie won't do quite so much for their board and other necessities. It is this same selfishness that drives them from home, not the advantages we give them. If the parents will deal as fairly with the children as with their neighbors or hired help there will be no trouble about their helping at home.

A parent of this class is not fighting the centralization of schools, but it is the ignorant, the lover of petty offices, the well to do who are afraid it might raise their taxes a trifle. In short, those whose self-love exceeds their love for our young folk. This is the same class who give the child a calf or acre of corn, then when the same has matured pocket the profits and lessen their interest in the farm. It is these parents, not the schooling, that drive the children from the farm.

What if 80 per cent of those schools are country schools and 64 per cent of the school children never attend any but country schools? Does that make it right? The country children are the strength, the hope, the flower of our nation and should have the best there is. Abolish the one-room school, centralize the schools and when our children enter the high school or go out into the world they will not be handicapped as now. At present, to my positive knowledge, the country school graduate is so far behind the village eighth grade graduate that they never cover the gulf and, work as they may, the others carry off the honors at graduation, not from superior intellect but from more opportunities to develop that intellect.

This is a day for big changes. Do not putter along, trying to make over the educational structures of our fathers, but with one wide sweep level them and erect one that will give our boys and girls a chance to show their supremacy over the children of the banker and day laborer, merchant and shop worker of our cities.

I will sign myself first "A Farmer's Daughter" and last, but by no means least, "A Farmer's Wife."

Rock Co., Wis. Mrs. C. E. S.

Discussing Consolidated Schools.

IN THIS department will be found a letter from a Rock county woman who takes a decided stand on the question of consolidated schools. She favors the consolidated school, and objects to some opinions which have been published in The Wisconsin Farmer. This woman has given the subject of consolidated schools as compared to the one-room, one-teacher, rural school, considerable thought and The Wisconsin Farmer is deeply indebted to her for her opinions. Other readers of The Wisconsin Farmer have opinions on this important subject and we would be more than pleased to hear from them. Address Wisconsin Farmer, Madison, Wis.

BARN VENTILATION SYSTEM.

To the Editor:—I have the King system of ventilation in my barn. It is all right and will do the work if properly put in. The theory is to take in the fresh air near the ceiling and force the impure air out near the floor, in this manner: Pipes are put in for intake of fresh air, opening near the sill on the outside with the opening screened. Same pipe has door near the ceiling on the inside, size and number to be regulated by the size of the room to be ventilated. Ventilating pipes are brought down from the cupola to within one foot four inches of the floor (screened). All pipes are air tight. I think it is best to have a flooring in the cupola; that is, do not try to ventilate the loft of barn direct from the cupola. Make the stable as near air tight as possible, with storm windows and double walls with air space between. All the hay chutes should be made to close tight. If you want the system to work keep them closed. Also keep the doors closed, as no system without artificial heat will work with a lot of openings. The theory is that the warm air rises to the ceiling and the impure or damp air is at or near the floor. With the cold air coming in from the top the draft in the foul air duct makes the circulation complete and the air in the stable will always smell fresh. I do not consider the King system complete without specially made pipes adapted for ventilation work.

CLUB REPORT FROM ROCK COUNTY.

To the Editor:—I am sending you a clipping from the Beloit Daily News, telling of a farmers' club meeting held in this vicinity (six miles west of Beloit) last Wednesday evening, thinking you might be interested in what this community is doing to make farm life more attractive. Our club was started last November with thirteen members. We meet once a month at the homes. It seems to be filling a need felt by all, as old and young are joining and all are taking a deep interest, both in the programs and the social side.

We hold a farmers' institute at the schoolhouse this week, Tuesday and Wednesday, the ladies going Wednesday and taking lunch and serving hot coffee at noon. There will be three outside speakers and some neighborhood talent.

If you care to publish the clipping and would like a report of meetings to follow I would be glad to send them to you. Mrs. D. Van Camp.

Beloit, Wisconsin.

[Editor's Note.—The clipping above referred to by Mrs. Van Camp calls attention to a regular meeting of the Rural Advancement Club held at the home of Benjamin Hanson, six miles northwest of Beloit. About eighty were present. Mr. Harry Mosely, the president, announced the topic of the debate, "Should boys stay on the farm?" It proved to be a very live subject, with interesting and forcible expressions on both sides. Mr. Markham, of the Y. M. C. A. at Janesville, was present and gave an interesting talk on how to increase corn yield by seed-corn testing and getting rid of corn pests. Ten new members were added to the club, making a total of fifty-eight.]

don't buy those EXTRA HORSES

Save DISCING, HARROWING, ROLLING.
Do all this work while you plow. Hitch a Kramer Rotary Harrow behind your plow—disc, level, harrow and pulverize as you go. Save extra teams right during the busy season. Produces a moist seed bed that germinates quickly—no clods or dry dirt to hold back your crops—no missing hills. Fits any plow, satisfaction absolutely guaranteed. Works in all kinds of soil—light draft, no extra horses required. The "Kramer" does more work than discing and harrowing the old way. Big FREE illustrated Folder.

Get a

King Plan of Ventilation

For Your Barn

IT takes years of experience to know how to design the right plan of ventilation for a farm barn. No two barns are alike—no two ventilation problems are alike. Each requires a special plan, worked out to meet the conditions. That's why you need a King Plan—prepared by the King Board of Experts—and backed by many years of experience in ventilating thousands of farm barns. With the intakes, flues and aerators for a King System, you get a blue printed plan showing the exact location of every unit of the system. Before this plan is sent to you it is passed upon by the King Board of Experts. If, with their experience, they can see that the plan would take care of the conditions in your building properly, it is marked "O. K." It is this work and study put into every King Plan that accounts for the certainty of satisfactory results with a

KING System of Ventilation

Planned Individually for the Building It Goes Into

You can install a King System in any barn, new or old. The King Aerators, which set on the roof, are the first part of the King System. They can be had with or without a complete system. You can install King Aerators at once with the idea of installing a complete King system now or later.

No other ventilators work as well with the King System as King Aerators; therefore, if you are not ready for the complete system, be sure to get King Aerators and be started right.

In using King Aerators alone you ventilate the haymow or upper part of the barn as well as add beauty to the building.

King Aerator

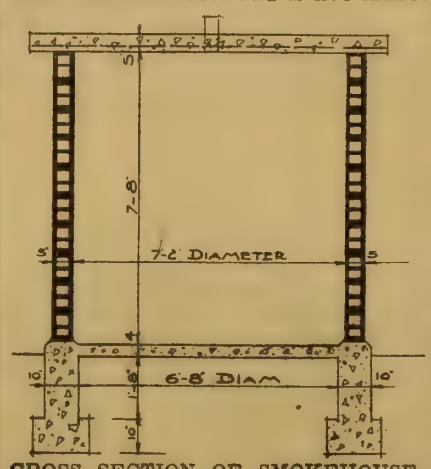
THE KING AERATORS on the Roof are the first part of the King Ventilating System

ROUND-TILE SMOKEHOUSE.

A smokehouse like this one is eight feet in diameter and eight feet in height. It is built out of hollow clay building tile and rests on a concrete floor and footing. The roof is of re-enforced slab concrete and is five inches



CROSS SECTION OF SMOKEHOUSE.

thick. A fireproof house of this description has been put up when the materials that went into it cost but $28, and the simple method of construction required only the unskilled farm labor to complete it.

The concrete footing is ten inches thick and is two and one-half feet under ground. Make this concrete of the following proportions: One sack of Portland cement, three cubic feet of clean, coarse, sharp sand and five parts of coarse gravel mixed with water to make a real damp or sloppy mixture. In pouring it into the forms be careful not to jar loose any of the dirt of the trench walls. The floor should be at least four inches thick and could be made of the same material as was the foundation and footings. Drain the floor to the front and trowel the surface down smooth. For the tile walls hollow clay silo blocks were used and were laid in a lime and cement mortar. The concrete roof slab is re-enforced with a heavy wire mesh and has a small opening in the center for ventilation. This roof slab can be built in its place or on any level platform or floor would be much

TILE SMOKEHOUSE.

easier. It can be lifted into place as soon as it is thoroughly hardened. Make the door frame out of common two by six-inch planks and drive twenty penny spikes through the sides of the frame into soft mortar so as to make a solid joint between the tile walls and the door frame. These materials are required:

5½	barrels cement	$ 8.00
2	yards clean sand	2.00
3	yards coarse gravel	3.00
230	hollow clay tile 5x8x12	10.00
60	sq. ft. heavy wire mesh re-enforcing	2.00
1	door frame 2 ft. 6 in. by 7 ft.	1.00
1	door 2 ft. 6 in. by 7 ft.	2.00
Total cost of materials		$28.00

CLOSING FARMERS' INSTITUTES.

The schedule of Wisconsin Farmers' Institutes from the last of February until March 10th follows:

Dodge county—Le Roy, February 29th and March 1st; Neosho, March 2d and 3d.

Fond du Lac county—Mt. Calvary, February 29th and March 1st; Van Dyne, March 2d and 3d.

Ozaukee county—Horn's Corners, March 7th and 8th; Knellsville, March 9th and 10th.

Racine county—Yorkville, March 7th and 8th; North Cape, March 9th and 10th.

Sheboygan county—Rhine Center, February 29th and March 1st; Adell, March 2d and 3d; Oostburg, March 2d and 3d; Howard's Grove, March 7th and 8th.

Manitowoc county—Cato, February 29th and March 1st.

Milwaukee county—South Milwaukee, February 9th and 10th.

Kenosha county—Kenosha, March 9th and 10th.

Waukesha county—Mukwonago, March 9th and 10th.

Waupaca county—Waupaca, February 29th and March 1st.

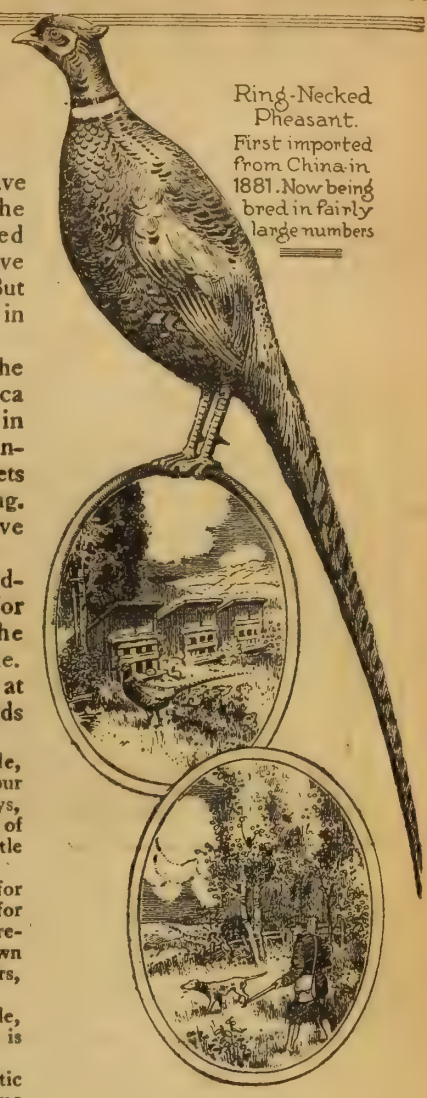
Winnebago county—Ring, March 2d and 3d.

Wisconsin farmer boys ought to take an interest in the baby beef contest which has been inaugurated by the Wisconsin Live Stock Breeders' Association. Particulars concerning this contest may be secured by addressing R. Baker, assistant secretary, care college of agriculture, Madison, Wisconsin.

It isn't too late to get that farmers' club started before summer time. Sample constitutions and by-laws and programs which have been used by clubs already in a flourishing condition may be secured by writing direct to C. J. Galpin, Madison, Wisconsin, care college of agriculture.

Five hundred bushels of potatoes to the acre is the accomplishment of a Nova Scotia farmer.

Breed Game Birds on Your Farm



Ring-Necked Pheasant. First imported from China in 1881. Now being bred in fairly large numbers

FOR many years, we in America have spent much time bemoaning the disappearance of our feathered game. It is indeed a fact that we have little game to eat and little to shoot. But we can have an abundance of game in the fields and on the market.

The farmers of this country have the land and the enterprise to make America the greatest game producing country in the world. They can supply the ever increasing demand of American markets and American sportsmen by game farming.

To you, game farming should prove of interest for three reasons:

It is profitable from a marketing standpoint. The demand for eggs and for breeding stock is much greater than the supply, and will be for years to come. Pheasant eggs, for instance, sell today at from $20 to $25 a hundred. Live birds bring from $5 to $7 a pair.

It will, at small expense in time and trouble, supply you with an abundance of food for your own consumption. Pheasants, wild turkeys, quail, grouse, and other birds forage much of their own food, and require comparatively little attention.

It will provide more shooting for you and for everyone, for it is a fact that game raised for sporting purposes can not be confined in any restricted area. At the same time, those who own large acreage, or who pool their land with others, get profit from those who pay for sport.

Game farming can be done on a small scale, and as a side issue to regular farm work, or it is a profitable occupation in itself.

Women on the farm who are raising domestic poultry, will find it worth while to breed game birds as well.

When conducted on a large scale, a game farm produces sufficient income to be a paying business in itself.

But this subject is too big to be properly treated in this space. Every progressive farmer is sure to be interested in it. Write for the book, "Game Farming for Profit and Pleasure," which will be sent to you without cost. It tells of the subject in a most interesting and informative manner. Fill out the coupon below and a copy will be mailed you at once.

DRAINAGE INCREASES YIELDS.

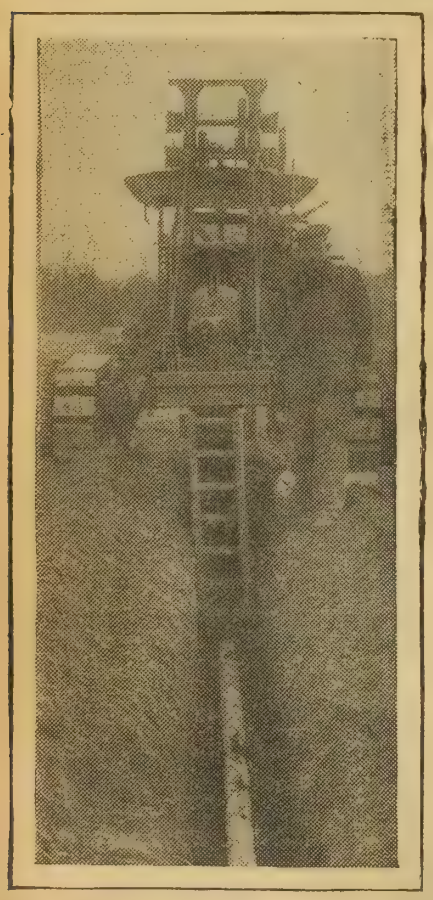
Experiences of Pea Raisers in Ozaukee County, Wisconsin, Have Proved the Value of the Ditching Machine in Farm Operations.

OZAUKEE COUNTY, WISCONsin, farmers, because several of their number have discovered the value of proper land drainage, have taken an added interest in tiling and a great amount of work was done in that county last fall and more is planned this spring.

SCENE IN FLAT FIELD WHERE MACHINE IS BUSY DITCHING AND TILE IS LAID READY TO BE SET.

This interest by the farmers has been increased by the drainage work undertaken by the Cedarburg Canning Company on its own farms at Cedarburg, where about 260 acres are to be underlaid with tile with the knowledge that this soil will not only produce better but larger crops in the future. This canning factory cans a very high-grade line of peas, and the success with peas by some of its patrons on properly drained soil led the owners of this factory to immediately lay out an extensive system of tile drainage.

For several seasons Theodore Wittenberg, one of the owners, noticed that some farmers brought him a better quality of peas than others. One of his patrons in particular always "topped" the market and his crop was



DITCHER AT WORK IN OZAUKEE COUNTY.

put to one side and used in canning a special brand which sold at a little higher price than the average product. Mr. Wittenberg wondered how this farmer happened to raise peas of such exceptional quality. He knew the soil about Cedarburg was all practically the same. He knew that the original seed stock was about the same. He knew that the cultivation methods were similar throughout the district. One day he took the trouble to call upon the farmer and asked him for the secret of the "quality" peas. He found that the secret was "better drained land," and the "better peas" were the result of proper distribution of water, underdrainage and ideal soil conditions made possible by tiling. Peas can stand almost anything except a soil that is too wet. They can stand frost and drouth much better, but wet lands mean poor crops.

MACHINE DID SUCCESSFUL WORK ON STONY GROUND.

The success of this patron pleased Mr. Wittenberg so greatly that he immediately began a study of drainage conditions. He found that he had certain spots on his farm that were yielding only about a tenth as much as they should yield, principally because of poor drainage, which left the ground wet and cold, delayed cultivation and cut down the yields. This led to his introducing better drainage methods on the company lands with the primary purpose of increasing their own yields and the secondary purpose of proving to the patrons of the cannery how much more they could grow on properly drained land and how much it would be to their financial advantage to tile.

Mr. Wittenberg immediately began his drainage system with the result that the canning company now owns and operates a complete power ditching outfit, which digs perfectly the trench for the tile. When he completes draining the company farms this spring Mr. Wittenberg plans to drain land on contract for the farmers in that vicinity, as tiling can be done much cheaper by machinery than by the old hand method. Mr. Wittenberg told an editor of The Wisconsin Farmer who visited him recently at Cedarburg that he believed he could secure contracts now for enough tiling to keep him and his power outfit busy for the next six months. The writer found him an enthusiastic booster for drainage and the success of his patrons and neighbors makes him all the more certain it is the wise and profitable thing to do, as the most expensive lands on the farm are those just dry enough to plow and too wet to produce.

Mr. Wittenberg began his drainage operations last fall, and before winter set in had laid about 20,000 feet of tile, ranging in size from three to eight inches. All of this he did with his power outfit and he plans to lay another 20,000 feet this spring, which will about complete the drainage of 260 acres of the 650 acres operated by the canning company. Most of this will be four, five and six-inch tile, and Mr. Wittenberg says that he does not expect to lay any more three-inch tile. Although it may be satisfactory he prefers to be safe and lay an inch larger tile. On the fourth day that he operated the ditching machine he laid 1,600 feet of tile in one day and he believes that with a better knowledge of operation he can lay 2,500 feet daily.

As this tiling was only done last fall there are no statistics as to yields, but in the Cedarburg neighborhood there are several farmers who have tiled by the hand method who have had good results. Fred Rintleman tiled one of the wet spots on his farm where he has never had a crop, and the result was a good corn yield last year. Considering that last year was very wet and poor for the corn growers this is considered a remarkable testimonial in favor of proper tiling and drainage.

Henry Kuep, of Cedarburg, a patron of the cannery, tiled twenty acres last fall and is expecting splendid results from this land the coming season. Mr. Kuep in conversation with an editor of The Wisconsin Farmer, said that he considered tiling worth far more than the expense, and that the increased value alone offset the cost of tiling. Mr. Kuep figures that it cost him between $7 and $8 an acre to tile drain his land by hand, and Mr. Wittenberg believes that he can save the farmers money by doing it with power. Mr. Kuep used a four-inch tile for the laterals, and as he had a splendid flow of water through his tile last fall he has every reason to believe that this twenty acres will be in splendid condition this season and will return bigger yields because of drainage.

Fred Kohlwey, of Cedarburg, drained five acres last year, and is planning some additional work this season. One plot which he drained gave him a good corn yield last year, despite the wet season, Mr. Kohlwey had had crops before on this plot, but they were never sure, and the corn would have certainly failed last year. Often the crops were drowned out and the labor of plowing, cultivating, seeding and planting proved nothing but an expense. He used four-inch tile mostly and some three inch. The exact cost he did not keep, but he feels certain the added value will more than offset the original cost.

Mr. Wittenberg, when he began studying drainage for his lands, secured an illustration of the follies of poor tiling. If a farm is worth draining it is worth draining properly, and the criticism on tile drainage comes mostly from those who have improperly installed systems. Mr. Wittenberg discovered that one section had been drained before and tiling laid about four feet deep. This had been poorly laid and had filled with sand and dirt and was useless.

These are only a few of the draining operations in the Cedarburg vicinity and indicate the interest which success in drainage work has aroused. In another year or two there will be many acres of poor land in this section of the state reclaimed by proper drainage.

MUCH LABOR COSTS SAVED BY THIS METHOD OF DITCHING.

Making Room For More Crops.

Stump Puller Found to Be an Economical Way--- By All Means Get to Work and Clear More Land.

THERE is one thing that the American people, with all their collective invention genius, adaptability and resource, cannot do. That is create more land on which to grow crops.

Now we have reached a point in developing this country where practically all the fertile land that has been fully prepared and made ready for cultivation by nature is producing crops. There is very little good land

HOW GOOD STUMP PULLER HANDLES GIANT STUMP.

ready for immediate cultivation open for settlement today. It's already under the plow and producing year by year the foodstuffs which feed the 95,000,000 people who call the country "home." It produces abundantly, too—a gigantic crop total amply sufficient for overmaintenance.

This is just the reason why the United States government and a large number of private corporations and individuals are spending billions of dollars in great reclamation schemes today. It is the reason, too, for the fact that hundreds of thousands of people not ordinarily interested in land are now buying. Valuable as land is today it must inevitably become much more valuable in the future and most thinking people realize that fact.

Of the huge land areas which could be made productive and which are potentially as valuable as the land which now grows crops only a part requires irrigation or drainage to become pro-

PILING UP STUMPS FOR BURNING.

ducing land. There are yet in this country enormous areas of the very finest land, well watered, well drained and well located, but which remains nonproducing simply because it is stump land. There's nothing else the matter with it and its preparation for crop growing is a simple and comparatively easy process, too. Yet the hundreds of thousands of land seekers overlook it to buy the higher-priced reclamation lands.

This country has today about 100,000,000 acres of cut-over land where the stumps still stand and no crops are grown and probably half as much more on which the stumps are so plentiful as to materially hinder crop cultivation and production. Generally speaking it is good land, too—fertile land with tremendous possibilities for crops. More than 75 per cent of it could be farmed successfully and with good profit for the owner.

This state alone—Wisconsin—has hundreds of thousands of acres of cut-over land that could be cultivated and made to yield big crops of every sort of farm produce. Much of it is as naturally fertile and as well located as the highest-priced land in the state. Where it is being cleared enormous crops are grown and the value of the land doubles and frequently triples within a few years' time. It can be bought—lots of it—for $20 and $30 an acre in the raw state and is worth, cleared, an average of $100 an acre.

There is no logical explanation for the fact that these fertile acres in Wisconsin and other states lie fallow while land seekers buy reclamation land. It is simply another case of overlooked opportunity.

The old theory that land clearing must necessarily be an extremely hard, slow and expensive process has been exploded. Modern methods have robbed that job of its terrors just as is the case with hundreds of other jobs. Clearing land by the modern process is neither especially hard nor particularly expensive and the land seeker who passes up the fertile cut-over land because he feels unequal to the solving of the clearing problem is making a serious mistake.

The cost of clearing land nowadays is nowhere near equivalent to the increase that the clearing makes in the value of the lands. That's true regardless of how the work is done. There are very few things that can be done with land that add more to its value than clearing does.

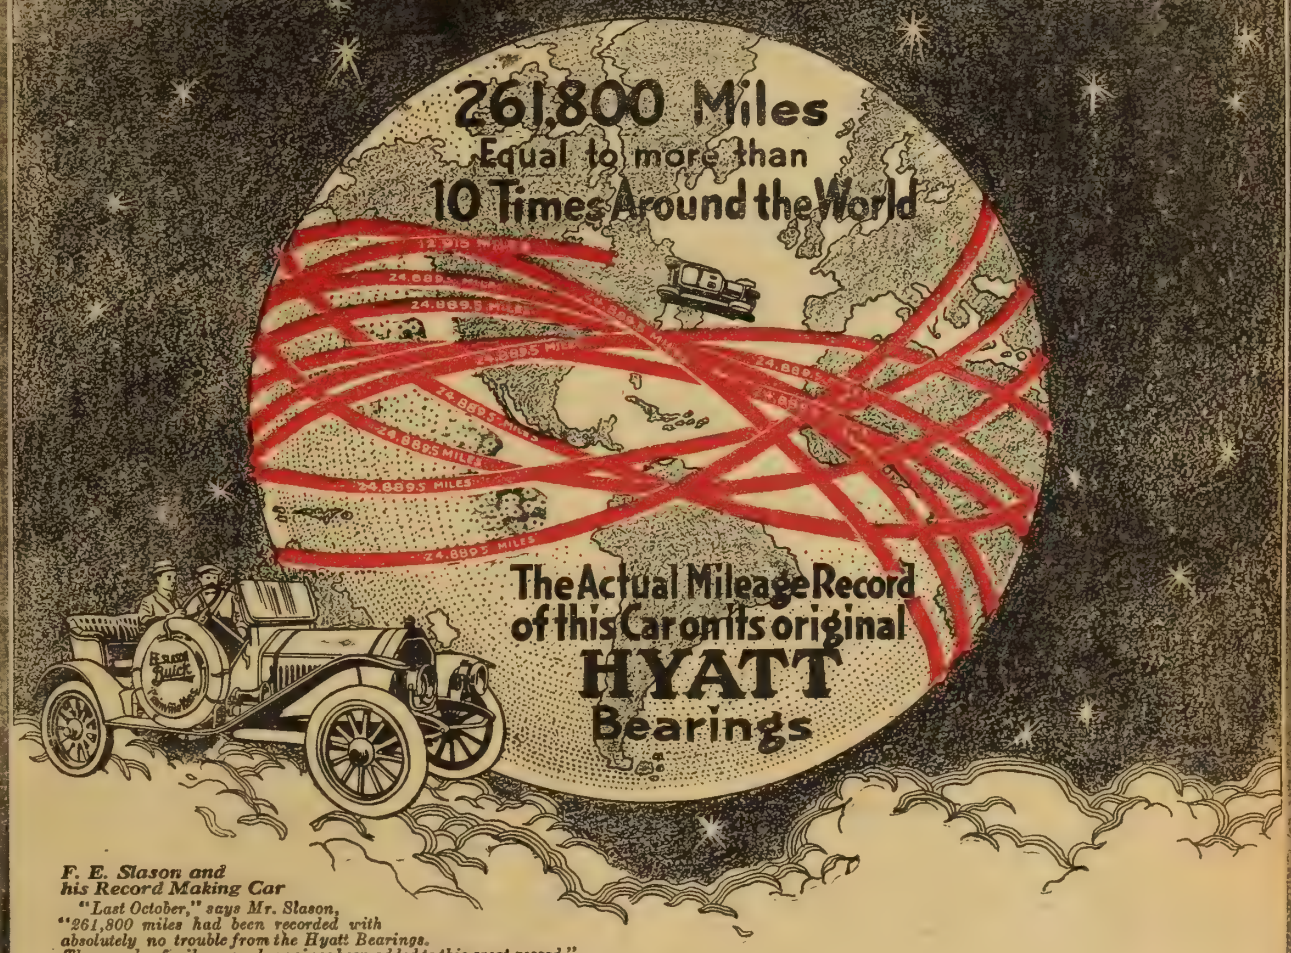
There are several distinct ways of

(Concluded on page 34.)

Marvelous Mileage Attained On

HYATT

ROLLER BEARINGS



F. E. Slason and his Record Making Car
"Last October," says Mr. Slason, "261,800 miles had been recorded with absolutely no trouble from the Hyatt Bearings. Thousands of miles more have since been added to this great record."

SUCH severe and constant service proves the worth of Hyatt Bearings. Engineering data has been reinforced by records of every day service obtained through our recent investigation.

From everywhere came indisputable evidence of the marvelous performance of Hyatt Quiet Bearings.

On no single record, however, rests the reputation of Hyatt Bearings. The faithful service of **millions** in daily use offers a mighty testimonial to their value.

Their remarkable merit is evidenced by the following records which have been carefully investigated and verified.

Representative Mileage Records of Cars on their original Hyatt Bearings

NAME	CAR	MILEAGE	NAME	CAR	MILEAGE
F. E. Slason, Plainville, Kansas	1909-Buick	261,800	J. J. Moore, Philadelphia, Pa.	1911-Ford	147,571

There are seven sizes of the Silberzahn—the right size for every farmer's need.

"THE KING OF ENSILAGE CUTTERS"

The Silberzahn Cutters of past years have been wonderful machines—famed for their simplicity, safety, easy-running, durability and great capacity; but the new 1916 Silberzahns with all-steel frame, automatic feeding device and other valuable improvements are simply *marvelous.* In ease of operation, clean cutting, freedom from accidents and trouble, great capacity, the

Light Running Silberzahn

stands in a class by itself. Here are a few of the many valuable features that should make the "Light Running Silberzahn" your choice:

All-steel frame insures strength, compactness, long life, low upkeep cost. *Low Feed Table,* combined with extra big roomy throat and automatic feeding device saves expense of man at machine. *Positive Safety Device* prevents accidents to machine or operator. *Malleable Knife Heads,* accurate knife adjustment and special arrangement of cutting head insures clean cutting at enormous capacity. *Shear cut* insures better quality of ensilage. *6-arm Blower* that simply can not clog and is easily regulated to height of silo. *Independent Control* of blower and cutting mechanism *saves power* and prevents clogging of feed rolls or choking of blower. *High-grade Bearings* placed just right insure smooth, light running at all times.

WRITE TODAY FOR THE SILBERZAHN BOOK

which gives full details and explains *how* and *why* the Silberzahn is *better.* This book if *free*—write today for your copy.

MANY IN FORTY-POUND LIST.

Thirty-one cows made the forty-pound list in the New Richmond Co-operative Cow-Testing Association for the thirty days ending February 4th, according to the report of Ivor Jones, official tester. Four two year olds made the thirty-five-pound list. This is a gain of three forty-pound cows and one thirty-five-pound heifer over December. The report follows:

VALUE OF TESTING.

The value of cow testing in Barron county is being illustrated by the work of the association there as indicated by the report of W. J. Markoff, official tester and secretary. In connection with the report of the forty pounders for the month ending January 15th Mr. Markoff says:

It is hard for anyone to believe that they are keeping poor cows after being in the dairy business for a number of years, raising and selecting what one thinks are good cows, and then find a few boarders in the herd; but through it all you notice that you have been placing practically the same value on a cow producing 125 pounds of butter fat in a year as on one that produces 300 pounds or more.

Cow testing and systematic weighing of milk is one of the best lessons in farming. It will show how much each individual cow has produced in butter fat and cash. Four cows in one herd that has been carefully graded up made the following record:

Maude produced 350.5 pounds fat valued at $102.81 in eleven months.

Rose produced 281.7 pounds of fat valued at $82.74 in nine months.

Pet produced 295.7 ponunds fat, valued at $84.74 in eight and one-half months.

Jane produced 125.7 pounds of fat valued ot $41.21 in nine months.

All of the above cows freshened about the same time and all received the same care and feed. But what a contrast in the figures. The farmer found he had three cows in his herd of sixteen that figured only up to 125 pounds of butter fat and he did not wait long before he sold them. The average for his herd was 240.5 pounds of butter fat per cow, which I consider fairly good for merely grade Holstein cows.

In dairying performance at the pail is the all-important criterion of value. Fine features and beautiful coloring of the coat may attract the attention of the casual observer, but the cow's record is the important question.

The January report follows:

Owner, name and breed	Age	Lbs. milk	Per cent fat	Lbs. B. fat
L. M. Krippner				
Lad's Lorlette, J...	8	816	5.4	44.1
J. Rauchenstein				
Nell, G. J.	4	1221	4.0	48.8

The best way to tie the cow ever devised. Hundreds of thousands sold every year. Government adopted. Will last a lifetime. Cow rests in perfect comfort. Can turn her head to lick her flanks. Does not bruise her shoulders when she rises. Louden stanchions can be used in any stall. Ask your dealer or write us.

PROGRAM STATE HOLSTEIN MEETING.

Arrangements for the annual banquet and meeting of the Holstein-Friesian Breeders' Association of Wisconsin to be held at Watertown, Wisconsin on March 1st-2d are now complete, and all interested in the breeding of Holstein cattle in the state of Wisconsin are urged to attend.

The banquet will take place at 7:30 on Wednesday evening, March 1st. It is tendered the Holstein breeders of Wisconsin free of charge by the business men in Watertown and the Holstein breeders in that vicinity. A program of after-dinner talks and toasts will be held in connection with the banquet.

The regular business and literary program and meeting will be held on the following day, Thursday, March 2d. The meeting will open at ten o'clock with an address of welcome by Mayor Charles Kading, of Watertown. W. C. Schroeder, West Bend, Wis., will respond to the welcome. J. P. Riordan, Mayville, Wis., acting president of the association, will next render the president's annual address. C. P. Norgord, state commissioner of agriculture, will follow with an address on "The State and the Farmer." This completes the morning program.

The business session will be held from one o'clock to two o'clock immediately following the noon intermission; after which two important addresses will be given. W. S. Moscrip, the prominent Holstein breeder and judge of Lake Elmo, Minnesota, will speak on "The Improvement of Holstein Type," and Dr. H. B. Favill, vice president of the American Holstein-Friesian Breeders' Association, who operate a large Holstein breeding establishment at Lake Mills, Wis., will present "Our Obligation to the Grade Cow."

JANUARY SCORING EXHIBITION BUTTER.

To the Editor:—There were 105 entries of butter in the January scoring exhibition held at the dairy department, University of Wisconsin, January 12th.

Nearly every buttermaker placed his score on the tub of butter before sending it to us; these scores show that such work is helping the buttermakers to know when they are making "extras" or "firsts," as they have the commercial judges' scores to compare with their own.

The method blanks sent with the butter by eighty-two of the buttermakers show that twenty-seven of the eighty-two are pasteurizing the cream for buttermaking. This is undoubtedly a larger percentage than would be found if all the creameries of the state were asked about their daily practice on this point, but when the creamery patrons realize that pasteurization at the creamery is necessary to stop the spread of tuberculosis among their cows they will insist on every creamery and cheese factory in the state using a pasteurizer.

At our last scoring, eighteen out of seventy creameries reporting on this point were pasteurizing the cream for buttermaking, and as this, when correctly done, destroys the disease germs in the buttermilk of the creamery the patrons of such creameries are going to reap the benefit of the practice and remove one cause of disease among the cows in the community.

The butter was judged this time by Mr. O. A. Storvick, Prof. C. E. Lee and Prof. G. H. Benkendorf.

E. H. Farrington.

THE HIRED MAN AND THE MILKING MACHINE.

To the Editor:—The hired man likes the milking machine. It shortens his hours and relieves him of having the cow's tail switching in his face for perhaps hours each day. The milking machine increases a man's efficiency. It enables him to do in one and one-half to two hours what formerly required four. Sunday on a dairy that has a milking machine is quite different. The milking job becomes merely a chore. It leaves nearly the whole day for Sabbath observance.

Hired men can run a milking machine if they are of the right type. Recently the writer visited a farm where twenty-five cows are kept. The proprietor had been suddenly taken ill. The one hired man was manipulating the machine. Carefully he attached the teat cups. Carefully he turned on the power. Carefully he watched the flow of milk cease as the udder was milked dry. Carefully he tested each cow for a little additional milk after the tubes had been removed. The hired man confessed that it was the first time he had attempted to run the machine. He surely was handling it successfully. It is true that he may be of a superior type and ability to some hired men. He is the only type that should be hired on a farm where cows are kept. Hired men of the future will operate milking machines and will do so satisfactorily.

H. E. McCartney.

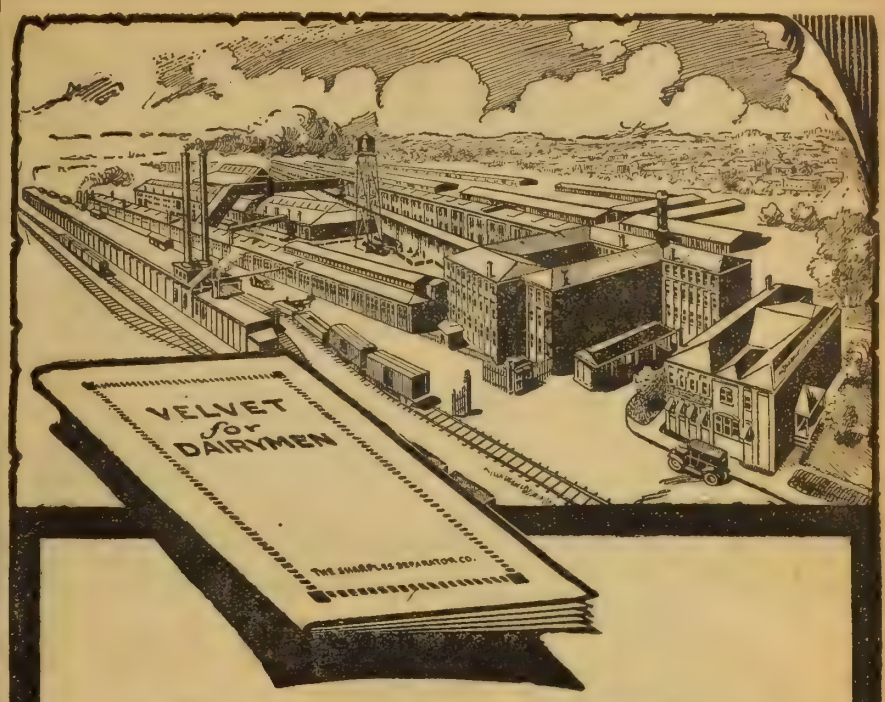
COW TESTING IN LANGLADE COUNTY.

The Langlade County Cow-Testing Association began its third year of work on Monday, February 14th. Mr. George Thull, of Marinette, is official tester.

At a meeting of the association held on Saturday, February 12th, the following officers were elected: President, Peter Krier; vice president, Chas. Schotte; secretary F. C. Swoboda; treasurer, H. C. Head. Directors: Gus Schroeder and Otto Klessig.

The association voted to charge $3 per ton for silage and $1.50 a month for pasture, and regular market prices for grains and concentrates. About three-fifths of the cows signed up for the coming year belong to members who have been in for either one or two years.

The Green County Agricultural Society met recently at the office of the secretary, M. C. White, and set the date of the Green county fair for 1916 the week ending September 9th.



More Dairy Dollars

We have found a way to bring you more dollars without increased expense. We call this new profit "velvet," because it comes so easily. Our new book, "Velvet for Dairymen" tells all about it.

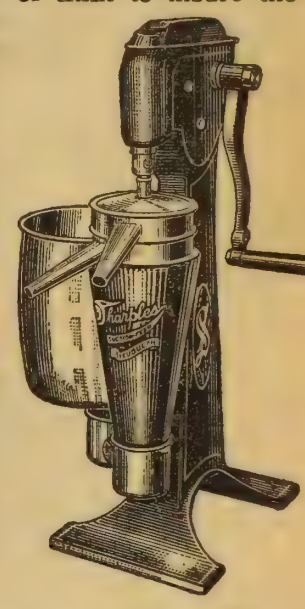
Your separator is losing cream, no matter what the make. A famous experiment station says, "*The use of the gravity can, a low speed of the separator, and an excessive rate of inflow cause heavy loss in butter fat.*" They have proven that 95% of all farm separators are turned below regulation speed. When the speed slackens, a lot of the cream escapes with the skim milk—and with the cream goes the profit.

The annual loss from imperfect separation is $47 on the average farm and upon many farms it is $100 and more. That's the tax you pay because you can't turn your separator at just the right speed all the time. But with

THE NEW SHARPLES SUCTION FEED

Separator you get all the cream at any speed.

A wonderfully simple invention enables the bowl to *drink in just the right quantity of milk* to insure the closest possible skimming. You may turn slow and make the work easy or you may turn fast and get through quicker. You simply won't lose cream with the "Suction Feed."



You get smooth cream of an even grade whatever the speed of the separator. Uniform cream makes fancy butter that brings top prices.

The supply can is only knee-high. There's no hard lifting to empty heavy milk cans.

The new machine has all the features that have made the Sharples Tubular famous and many other new vital and exclusive features found in no other separator.

Send now for our new book, "Velvet for Dairymen," and learn how to secure this new dairy profit. Address Dept 44

STOP! READ! FOR GALLOWAY'S

My New 250-Page 1916 Bargain Book

Just off the press. A postal or the coupon in corner gets it. Will save you from $100 to $500 in 1916, depending upon what you buy.

The book is new, different and original. It tells how and why I actually divide the melon with my customers—how this year the melon will be bigger and juicier than ever. Tells how this business was started with nothing only a few years ago and now runs into millions.

It explains my system. Tells about my policy which eliminates lost profit between producer and consumer. Printed in four colors. A work of art, an eye opener, an educator. A money saver—a money maker—for everyone who gets it—and should be in the home of everyone who reads this paper.

Like Having a $1,000,000 Stock of Merchandise in Your Own Home to Select From

Besides our own manufactured products which are sold exclusively by us, we have at the request of our many customers, added a large line of General Merchandise needed in every home. Things that we have never offered before, such as Automobile Tires and Accessories, successful up-to-the-minute Electric Lighting Plants, new line of Incubators and Brooders, Dishes, Silverware, latest patterns of Carpets and rugs, swell line of Furniture, Baby Carriages, Phonographs, Paints, Fencing, Hardware, Roofing, Harness, Buggies, Sewing Machines, Ladies', Men's and Children's Wearing Apparel, Galloway Bros. & Company's famous Royal Purple Grand Champion line of Pure Tested Seeds, etc.

Every article in this book carefully and exactly illustrated and honestly described. Sold at rock bottom prices that will make new Galloway customers.

6 Selling Plans-Cash Or Easy Terms To Please Every Fancy-To Suit Every Purse

Look them over carefully. Select the one you like best. It's a new feature with us and will continue for only 90 days. It's to make new customers new friends to boost sales to create more living walking advertisements for the Galloway goods.

It's the chance of a lifetime to get acquainted with the Galloway Fair and Square Policy. It's a chance to save money on our direct from factory-to-farm plan and get what you need on the same easy or easier terms than you can get at home and I guarantee satisfaction or money back with freight paid both ways. Every article, every purchase backed by our $25,000 Bank Bond.

We want another 100,000 customers this spring. Your name on our customer's list will be welcome. Once on, the high quality, low prices and absolute satisfaction will keep you there.

When I first started in the manufacturing business, I made a harrow cart, then a manure spreader, next a gasoline engine, then a cream separator followed by a line of different farm tools. The latest addition to the Galloway family is the famous Efficiency Farmobile, which is the wonder of all tractors and now, after spending 5 years working, developing and negotiating, I am at last in position to offer the great buying public of this country the most remarkable line of low priced automobiles yet produced. Low price has been my watchword. The secret of low prices with me is not poor quality proven by the fact that this business has grown to millions in a few years through satisfied customers.

Listen! The secret is simply the policy I adopted in the beginning to make and sell goods at actual cost of labor, actual cost of material, plus one very small profit. Add to that big demand—enormous output, manufacturing with automatic machinery, standardizing all parts to go into my products which means cost of production down to a minimum, with my direct from factory-to-farm plan of selling which brings selling cost down to lowest possible point thereby puts my customers on a wholesale basis and you have the story in a nutshell.

Plan No. 1 Cash with order. Right down to bed rock prices. Money back if not satisfied for any reason.

Plan No. 2 Bank Deposit. Satisfy yourself before you let go of your money.

Plan No. 3 Half cash, half note. Transaction backed by our $25,000.00 Guarantee Bond.

Plan No. 4 All note settlement for those who want it. Pay out of your next crop.

Plan No. 5 Installment plan. One-tenth down and one-tenth each month, letting goods earn their cost.

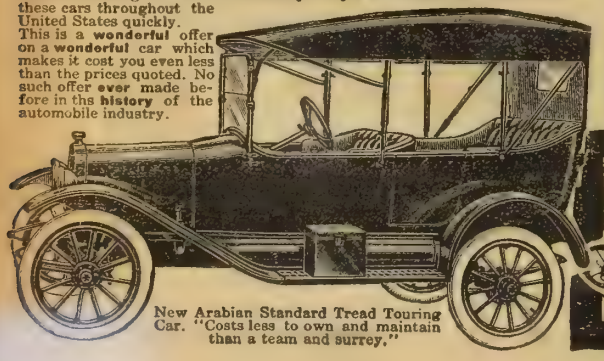
Plan No. 6 No money down. Try actually 30 days with money in your pocket and a year to pay.

Look! New 1916 Galloway Automobile

See the Prices! Read Specifications

A business or pleasure car for everyone. Price need no longer interfere with your enjoying pleasant rides. A light car, pleasing to the eye. Properly designed, carefully built. Easy riding. Has 4 cylinder motor, clutch internal cone type. Transmission silent sliding gears. Two speeds forward and reverse. Axles front I beam. Famous Baily skidless differential in rear axle. Drive, propeller shaft enclosed through universal joint to rear axle. Springs—full elliptic. Carburetor—Mayer. Standard automatic type lubrication. Splash system. Sight gauge on dash. Speed 35 to 40 miles per hour. Made standard tread. F. O. B. over transfer point nearest you. Waterloo—Kansas City—St. Paul—Chicago—Council Bluffs—or Jackson, Michigan. The quality is there. Service and satisfaction are assured.

WANTED! Ten men or more in every county to get our **special advertising distribution offer** which we are making for the next **thirty days** in order to introduce these cars throughout the United States quickly. This is a **wonderful** offer on a **wonderful** car which makes it cost you even less than the prices quoted. No such offer **ever** made before in ths **history** of the automobile industry.



New Arabian Standard Tread Touring Car. "Costs less to own and maintain than a team and surrey."

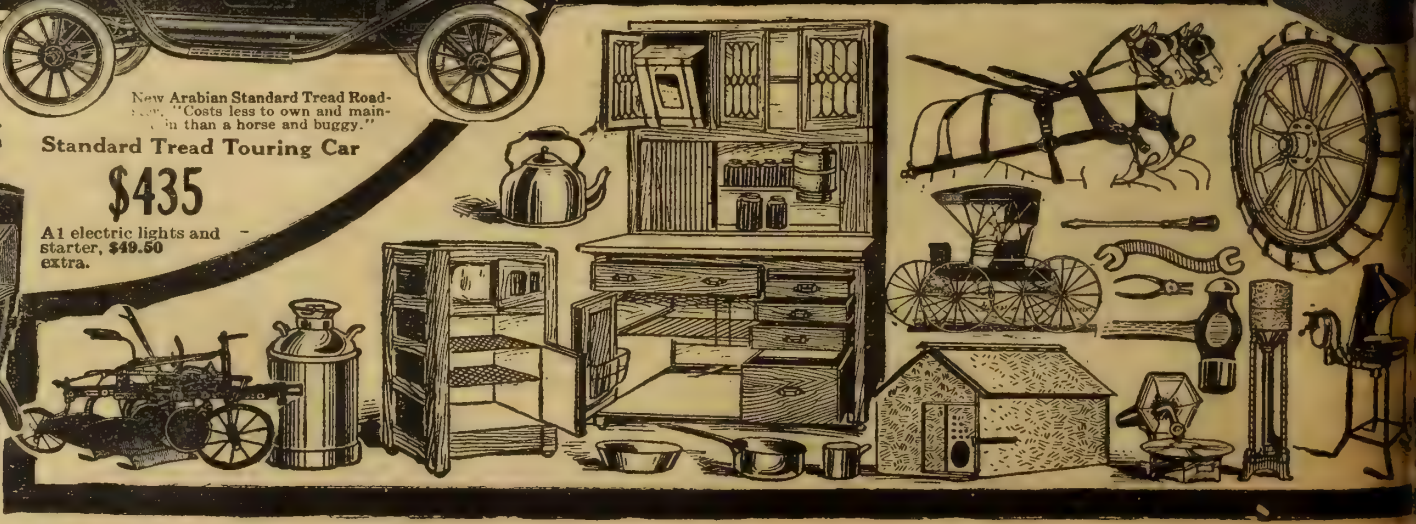
Standard Tread Roadster $385
A1 electric lights and starter $40.50 extra.

New Arabian Standard Tread Roadster. "Costs less to own and maintain than a horse and buggy."

Standard Tread Touring Car

$435

A1 electric lights and starter, $49.50 extra.



THEN WRITE
WONDERFUL BARGAINS

Travel 20,000 miles, look over every factory in the U. S. and all foreign countries. Look through every catalog published. Call on any one who sells the same articles. You won't find, you can't buy, from anyone, anywhere, on better terms, the exclusive patented, up-to-date articles at the bargain prices we make.
The four bargains below are representative of our entire line. Don't take my word for it. Satisfy yourself. Investigate. Compare. Test any or all of these four products of the Galloway factories with any other you ever saw or heard of. If they are not as claimed, exactly as represented, made of honest material, serviceable and satisfactory after 30 to 90 days' test on your own farm, return them and get your money back, including freight both ways. That's fair to you. It's satisfactory with me because my policy in dealing with farmers of the U. S. is satisfied customers at any cost.

10,000 CREAM SEPARATORS
NOW BEING COMPLETED IN THE GREAT GALLOWAY FACTORIES

These 10,000 to be sold between now and grass. They are so good, so satisfactory, such high quality, that one in a neighborhood sells more. To get more of them in new territory, to build up summer sales, I am making unusual 90-day proposition in addition to low prices already quoted. The separator I sell is equal to any separator made. My customers say they are better. The thing to do is find out for yourself. All I ask is, before you buy a separator of any kind, of any make, at any price, that you get my catalog. Read over the Separator section, then order one on 90 days' trial, which means using it 180 times before you need decide to keep it or not. If you keep it, do so on one of my six selling plans. A guarantee for 10 years against defective material and workmanship goes with each one and every sale backed by a $25,000 Bond. You have everything to gain, nothing to lose, because it's all up to you. You are the judge—the jury. The separator itself, the way it's made, are the evidence. It has big seamless pressed steel supply tank, high crank shaft, short crank, oil splash lubrication, high carbon steel gear shaft. The base is strong, well balanced, giving machine solid firm footing. Large worm-wheel. Sanitary drip pan, hinged cream pail shelf, strong sanitary bowl, high carbon steel bowl spindle, low speed crank, only 50 R.P.M. These special features alone worth price of separator.

SPECIAL PROPOSITION on 10,000 New Galloway No. 8 Manure Spreaders
FROM NOW UNTIL SEEDING TIME AND IT IS NOT FAR AWAY.

This special offer is made with the idea of getting ten or more in every township in the next few weeks, because one Galloway No. 8 always sells from one to a dozen more, and we can afford to make this special proposition to get as many as possible scattered into every locality as quickly as possible. Buy on terms! We sell the Galloway spreader on six different selling plans, including cash, half cash and half note, all note settlement, installment plan (no interest). If you haven't the money handy buy on the last plan and let the spreader pay for itself. Some new features: Wider spreading—finer spreading than ever; all steel, non warping, non-cracking, double pulverizing beater; lighter draft, low down, double chain drive, cut under front wheels, big capacity, channel steel frame, trussed like a steel bridge, steel tongue endless apron, force feed, folding seat, manure guards over drive chains.
"Galloway, how can you do it"? That's the question that is often asked when people come to Waterloo. Go into our sample room and look over our new V-rake steel beater, tongue and frame Galloway No. 8 Manure Spreader, which we sell lower than ever! It is a money-maker—a cash producer. The manure spreader section of my big 250 page book tells you by actual photographs in colors all about this spreader. It illustrates to you how on one of my farms last year I made an experiment with and without manure which made a difference to me on one field of $17.00 per acre. Figure it out for yourself on forty acres!

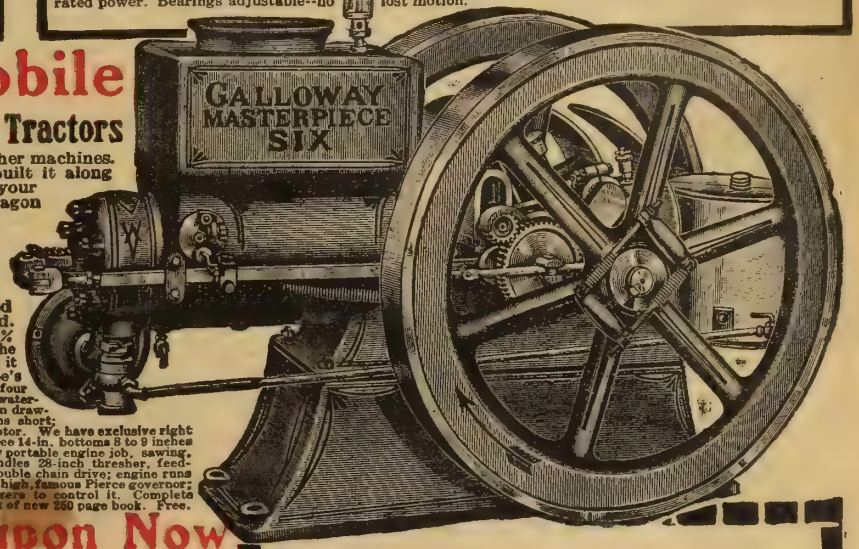
10,000 GALLOWAY ENGINES IN 90 DAYS
MY NEW SPECIAL PROPOSITION
Is ready for you today.

I want you to get it because this offer, in connection with my new lower than ever 1916 prices on Galloway Masterpiece engines from 1 3-4 h. p. to 16 h. p. will **save you money.** You can't buy a better engine than the Galloway Masterpiece. Tens of thousands of Galloway Masterpiece engine users have said so themselves! I build this engine right here in Waterloo in **my own factories** and build it **so good** that when it goes out into the hands of a customer, one Masterpiece engine sells from **one** to a **dozen** more. **Galloway Engines** sweep whole communities like **wildfire.** That's why I say

WAIT! DON'T DO A THING Until you have seen this wonderful 1916, 250-page book that tells all about Galloway engines and I explain my special advertising distribution offer! If you answered all the engine advertisements ever published you would not find an offer fairer, squarer or more in your favor. You owe it to your pocket-book and the satisfaction that you demand in the operation of the engine you buy to answer this advertisement and learn the particulars of this new 90-day offer to distribute 10,000 more Galloway Masterpiece engines from 1 3-4 h. p. to 16 h. p.! I know these 10,000 engines will speak for themselves and multiply my sales this year!
Our 1916 model is a mechanical master piece—a master stroke in engine design—built by master engine builders. Materials superior in quality —skilled workmanship — standardized -- develops away above rated power. Bearings adjustable--no lost motion.

Galloway's Efficiency Farmobile
The Wonder of All Farm Tractors

We call it the Farmobile because it is unlike other machines. We have eliminated unnecessary friction and built it along automobile lines. How far would you go in your automobile if it had an axle like your farm wagon or your mower?
The Galloway Efficiency Farmobile is built with anti-friction bearings, twenty-one sets of Hyatt Roller and Ball bearings in this Farmobile, which eliminates friction and reserves the power in the engine for the draw-bar and the pulley where it is really needed. By dynamometer test it only takes 15% of the motor's power to drive the tractor empty. On many tractors it takes from 50% to 75% of the engine's power to drive the tractor empty. Has four cylinders; valve in head, modern motor; water-cooled; working parts protected; 12 h. p. on draw-bar and 20 h. p. on pulley guaranteed; turns short; weighs 5200 lbs.; transmission a unit with motor. We have exclusive right on this patented transmission. Will pull three 14-in. bottoms 8 to 9 inches deep in clover or timothy sod; will do any portable engine job, sawing, silo-filling, corn shelling, shredding, handles 28-inch thresher, feed-grinder, pumping for irrigation, etc. Double chain drive; engine runs in tight oil-bath case; rear wheels 58 in. high, famous Pierce governor; engine never races. Only two levers to control it. Complete description in Farmobile department of new 250 page book. Free.



Mail Coupon Now

Get the Galloway 250-page catalog, look through the book carefully---Note the prices---Read the descriptions, and study the pictures; then send that trial order to get acquainted with Galloway Merchandise, and the Galloway method of saving you from $100 to $500 per year. Do it now, today.

A Powerful Light Tractor for Only

$550

Just see what we have to offer you for $550. Impossible? Not at all. The reason is merely this: All unnecessary parts have been eliminated from this new, remarkable tractor.

Happy Farmer Tractor

Frame all steel—light in weight—durable. Two-thirds the number of parts usually found on tractors of equal strength. Strain borne by wooden clutch shoes, pins and rollers—quickly and economically replaced. 88% weight on traction wheels—where it should be. Pulls anything that horses can draw. Greatest value in light tractors ever offered. Write us for full specifications.

DEALERS: The tractor you have been looking for. 1916 output extremely limited. Write immediately for terms and territory.

Happy Farmer Tractor Co.
330 Third Ave. North
Minneapolis, Minn.

It's All in the Spread

Two farmers using the same kind and amount of manure will produce varying crops. One spreads right and the other doesn't. Right spreading means prompt and even spreading, neither too thick nor too thin and without waste in either barn or field.

Manure has a fertilizing value of $8.00 to $10.00 profit per animal. The only way you can get this full value is by the use of a proper spreader. Such a machine is the reliable, guaranteed

NEW IDEA Registered U.S.Pat.Off.

the gearless spreader. Operates by strong chain. Conveyor gathers all the manure and does not race going up hill. Double cylinders insure thorough pulverization without clogging. The New Idea can be loaded full 35 inches high. Only 43 inches at highest point. Wheels track.

Spreads 7 ft. Wide Across 3 Corn Rows Spreads and Pulverizes a Load in 3 Minutes

The patented revolving distributor causes this remarkable spread. It goes beyond the wagon tracks so it is never necessary to drive over the spread manure. Variable spread from 3 to 18 loads per acre. Guaranteed against defective material and workmanship.

FARM MECHANICS

Auto, Farm Engine and Farm Machinery Ailments diagnosed and remedies suggested in this department

QUESTIONS AND ANSWERS.

To Recharge Dry Batteries.

I would like to know how to recharge small dry batteries.

Answer.—There is no satisfactory way to recharge dry cells. You can extend their life somewhat after they have become exhausted by punching a hole through the tar down into the black powder beneath and pouring in a little salt water.

Speed of Saw.

I have a four-horse-power engine and would like to know how fast to run a saw, thirty inches diameter. The saw has a pulley six inches in diameter, six-inch face. It has a ninety-five-pound flywheel.

Answer.—A thirty-inch saw should make about 1,000 revolutions per minute. About six horse power would be required. Your engine is suitable for a saw about twenty-two inches in diameter.

A Cycle Car.

Would a motorcycle engine, three-inch bore and three-inch stroke be practical for a small cycle car weighing about 200 pounds? I would use chain drive, two speeds ahead and one reverse. Would bicycle wheels be strong enough?

Answer.—Your engine would have power enough for a very light cycle car, using bicycle wheels. You should keep the weight less than 100 pounds if possible.

Lubricating Trouble.

I have a two-horse-power gasoline engine equipped with a double sight feed lubricator. The lubricator is located near the side of the cylinder, being supported by a pipe nipple and elbow. There is a pipe running from the lubricator to the crank case. In cold weather I have considerable trouble keeping the oil flowing through this pipe, as the oil thickens and stops flowing. Could differential grease be used successfully in the engine crank case by putting in a little every day or two?

Answer.—We would not advise the use of transmission grease in an engine crank case. There are some heavy motorcycle oils on the market that might be used as you suggest. It might be better for you to use a lighter oil in your lubricator during the winter months; or install a larger oil pipe between your lubricator and crank case.

Motorcycle Trouble.

I have a 1907 Indian motorcycle. It is ignited by three standard dry cells. The motor runs fine for a few miles and then begins to misfire. The spark is good at the start, but becomes very weak. I have a new piston, new cylinder, new carburetor and new batteries. Do you think the trouble is in the coils?

Answer.—The trouble is not in the coils, as coil trouble would prevent your engine from starting. It may be that when your engine is running dirty oil works into the timer case, causing short circuits that interfere with the ignition. It may also be that the contact points are too close together, drawing too much current from the batteries and rapidly exhausting them. As a rule, the contact points should be about one-thirty-second of an inch apart when entirely open.

Some Sawing Questions.

At what speed should a twenty-two-inch saw be driven by a three-horse-power gas engine? What size of pulley should be used on the engine, there being a five-inch pulley on the saw mandrel, if the engine makes 450 revolutions per minute? Which is the better, a sixty or a ninety-five-pound balance wheel? What size of canvas or rubber belt should be used? Should the engine stand well ahead of the frame, or close to the mandrel?

Answer.—A twenty-two-inch saw should make 1,200 to 1,400 revolutions per minute. Use a fourteen-inch pulley on the engine or a fifteen-inch pulley if you can obtain one. We believe the ninety-five-pound balance wheel would give the better results. However, that can be determined only by experiment. Use a four and one-half inch rubber belt. If your pulleys are wide enough use a five-inch belt. The engine should not set too close to the mandrel, as a very short belt does not drive as well as a long belt. A crossed belt drives better than a straight belt, but does not last as long.

Bosch Magneto for Lighting.

I own a Pope twin-cylinder motorcycle which is equipped with a Z. E. V. type Bosch magneto. Is there any way in which I could use this magneto for lighting, either direct or through storage batteries?

Answer.—There is not any practical way.

Batteries for Coils.

Will it injure a three-battery coil to connect six batteries to it, or a four-battery coil to connect it with eight batteries?

Answer.—There is danger of burning out the coils, ruining the condenser and burning the vibrator points. The coil might stand this excess for some time, but it is not advisable to risk it.

Speed of Auto Motors.

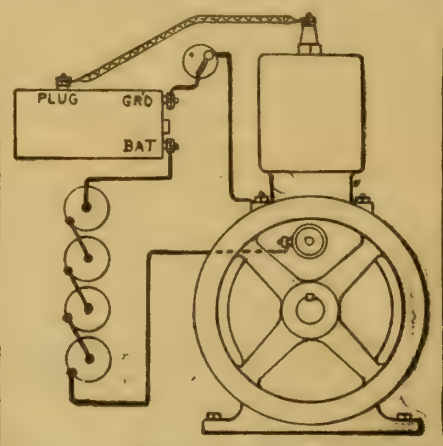
Why is it that the latest Chalmers has more revolutions per minute than other motors? I have read that the Chalmers engine can make 3,400 revolutions per minute and that many other motors can make only 2,600.

Answer.—The present tendency in automobile design is toward motors of very high speed in order to obtain as much power as possible from a given weight of engine, and also to give the car a more even motion. High speed motors have comparatively small, but perfectly balanced crankshafts, extremely light pistons and connecting rods and large valves.

Wiring Gas Engines.

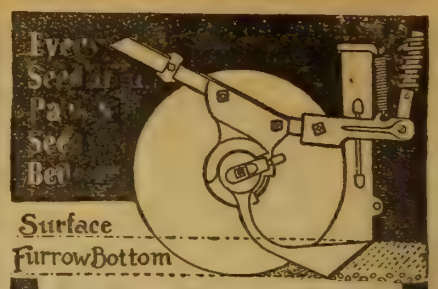
I would like to ask how to connect batteries and coils to gas engines. Should carbon or the zinc battery terminal be connected to the coil? Should the "ground" terminal on the coil be connected to the engine timer or grounded on the engine? In a make-and-break system, should the carbon or zinc battery terminal be connected to the coil?

Answer.—In either case it does not matter whether the coil is connected to the zinc terminal or the carbon terminal of the battery. It does not matter which direction the current flows. The figure shows the usual method of wiring a jump spark engine. Four or



five dry cells are connected carbon to zinc as shown. From one of the two remaining battery terminals run a wire to the battery terminal of the coil. From the ground terminal of the coil run a wire to the switch and from the switch to the engine. Or the switch may be placed in the line between the battery and the coil, thus avoiding the possibility of the battery running down due to a short circuit in the coil. Be sure that the ground wire makes good contact with the engine frame. From the other battery terminal run a wire to the engine timer. The coil terminal marked "ground" should not be connected to the timer, as the secondary as well as the primary current flows to this terminal, and the secondary current is injurious to the timer.

A make-and-break system is wired the same as a jump spark system, except that there is no spark plug wire. With a make-and-break coil it does not make any difference which coil terminal is connected to the battery.



Makes Every Acre Yield 10 Bushels More Oats

Drill your oats instead of seeding. It means more profits for you. With the New Peoria Drill you can give your yield per acre a good big boost. The disc shoe lays every seed in a packed bottom and *covers* it. No seed is left exposed to birds and weather. The

Peoria Drill

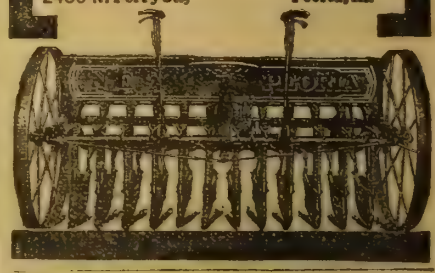
Starts the Crop Perfectly

Drills any of the small grain, or peas, beans and corn without injuring seed. Every seed counts. It's covered as it should be. All seed is planted at uniform depth—grows evenly—the whole field ripens uniformly—grain grades better in the market.

You can well afford to discard any other drill or any seeder for the New Peoria. Better crops pay back its cost quickly. Write for catalog featuring 18 sizes—big 48 inch wheels with long hub and wide tires.

Write for catalog—mailed FREE.

Peoria Drill & Seeder Co.
2480 N. Perry St., Peoria, Ill.



Your own right arm

on the lever of a "K" Stump Puller easily rips out any stump that can be pulled by any horse power machine. Develops a 48 ton pull—all an inch-steel cable will hold.

HAND POWER

K Stump Puller

Works by leverage—easy as rowing a boat. One man alone can pull from 50 to 100 stumps per day. Works equally well on hillsides or marsh land. Made of Krupp steel—weighs only 171 lbs. Guaranteed against breakage.

Ditching and Terracing Made Easy—Bigger crops—better farms with Martin Farm Ditcher & Road Grader

10 days' trial. Money-back guarantee. Cuts ditch to 4 ft. Grades roads. All Steel—Practical—Adjustable—Reversible Cleans ditches, cuts and works out dirt at same time. Does work of big machines. Soon pays for itself. Write for free booklet and introductory proposition. Owensboro Ditcher & Grader Co. Inc. Box 861, Owensboro, Ky.

UPPER WISCONSIN

UNDEVELOPED DAIRY OPPORTUNITIES.

[Editor's Note.—The following was prepared by E. J. Delwiche, director of the Ashland Junction, Wisconsin, Experiment Station.]

It is a trite statement to say that Wisconsin is a great dairy state, and yet the resources of the state from the standpoint of dairy farming have been scarcely more than half developed. The upper half of the state has from 9,000,000 to 10,000,000 acres of good farming land available for dairy farming. The estimate allows for waste land to be reserved for forest purposes and leaves out farm land not very well adapted for dairying or other agricultural pursuits. Upper Wisconsin possesses opportunities for dairying, demonstrated by the good dairy farms which are found in the upper section of the state. Wish to recall that some of the best records made by individual animals are located north of the line dividing the state into the northern and southern half.

In this discussion it is proposed to discuss the dairy opportunities largely from the standpoint of the possibilities of growing crops to feed to dairy animals. It should be remembered that after all the growing of crops to be utilized for feeding purposes is the foundation for successful dairying. In 1906 the experiment station established branch and substations in the northern region with a view to demonstrating the possibilities of crop production, soil management and farming in general. This work has been extended in recent years and today there are three branch experiment stations in the northern half of the state. At these stations problems affecting dairying and allied industries are studied. The improvement of crops for the north by breeding and selection is carried on. New varieties have been introduced and old ones improved by up-to-date breeding methods.

Clover grows bountifully throughout Upper Wisconsin and because of the fact that snow usually covers the ground during the winter months very little winter killing occurs. Medium red clover is the standard crop, although alsike and mammoth are also extensively grown. Medium red has given excellent results on nearly all classes of soil where tried. At the Ashland branch station and on the demonstration station at Superior yields of clover have ranged from two tons to over five tons in two cuttings. On sandy loam soil at the Spooner branch the yields have not averaged quite as high, yet yields of upwards of four tons in two cuttings have been secured. By sowing clover either alone or with oats and cutting the oats for hay if the season is dry good stands are assured. We have sown clover on corn land in May and cut over a ton of hay the same season as sown. Two cuttings are cut the following season. The sod is then plowed up and the land planted to corn. On Colby loam soil at the Marshfield station and on Kennan loam at the Rusk county demonstration farm medium red clover has given about the same results as on the red clays of the Lake Superior area. Alsike clover also gives good yields. It is particularly well adapted to rather wet land.

Alfalfa has been tried at the different stations in the northern section and also in co-operation with several hundred farmers. While the crop is not grown as readily as clover, it can be successfully raised providing the right care in soil preparation is given. On heavy clay soils at Superior and Ashland yields ranging from two to four tons in three cuttings have been secured. On the well-drained clay lands inoculation only is necessary. On the heavy soils of central Wisconsin and on the sandy soils of the northeastern section lime should be provided. At the Spooner station we have grown good alfalfa without liming. The indications are that liming will be required for best results. The feeding value of northern Wisconsin alfalfa is high. A Lincoln county farmer has found through experiments that increased production from his dairy herd resulted from changing his ration from bran and alfalfa to alfalfa alone; in other words, when fed in equal amounts, alfalfa gave better results than bran.

The soy bean is a crop of recent introduction in northern Wisconsin. Nevertheless, tests carried on at the different stations since 906 indicate that it is a splendid crop to substitute for clover to be cut for hay or to be grown for seed. It is particularly well suited to the sandy sections of northern and central Wisconsin. When the soil is well inoculated it is a certain crop and on sandy soil acid in character it has proven far superior to clover. Yields of cured hay have ranged from one to three tons per acre. It is, of course, an annual legume and hay is made from it the same year as planted. Soy bean hay is about equal in feeding value to alfalfa. Soy bean growing centers have been established in the neighborhood of Ellis Junction, in Marinette county; Stevens Point, in Portage county; Spooner, in Washburn county, and Tomahawk, in Lincoln county. Yields of seed range from twelve to twenty-eight bushels per acre. From what has been said it should be clear that legume crops for hay and pasturage can be grown abundantly in Upper Wisconsin.

Turning to nonleguminous roughage for cattle we find that this, too, can be grown in abundance. Corn for silage can be grown everywhere in the north and the yields, where proper care in growing the crops has been given, have been very satisfactory. On the substation near Superior we have grown eighteen tons of silage corn per acre and about as heavy yields at Iron River on the light type of soil. Equally as good yields have been obtained at the other stations. At the Spooner station we have grown seventy bushels of shelled corn per acre and about as much at Marshfield and Ellis Junction.

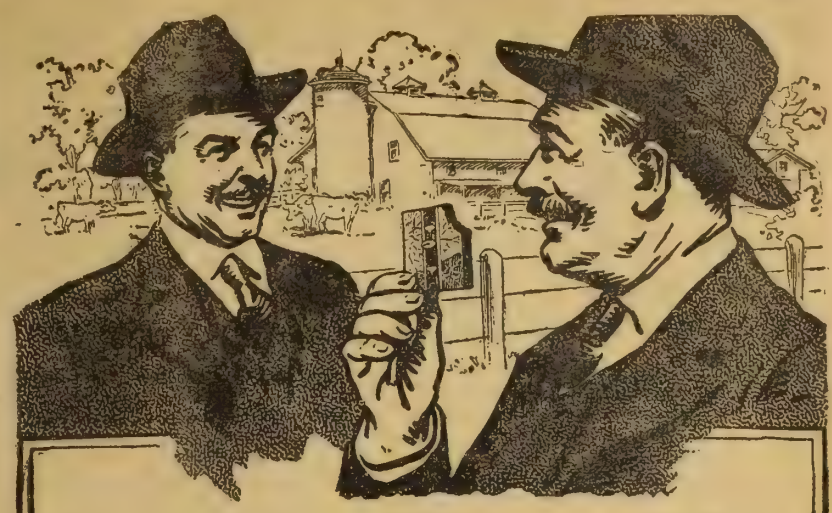
We have also found that peas and oats, when grown in double rows and cultivated, gave very good yields per acre. At the Superior station last year we grew nearly ten tons of peas and oats per acre. This combination makes good ensilage and when it is considered that the cost of production is much less than corn it can be seen that it is destined to be a good combination for making ensilage.

Root crops grow very readily in northern Wisconsin. They are particularly well adapted to the heavy clays and loams of the North. Rutabagas have given yields of over twenty-five tons per acre. These roots have given a little the best results of any of the root crop types we have tried. They are a very fine crop to supplement the clover, silage corn and other roughage, as feed for dairy animals. No northern Wisconsin farmer should neglect the growing of roots if he is to make the most of his opportunities.

The question as to whether it is possible to grow grain to supply at least a part of the concentrates for feeding dairy cattle is one that can be answered in the affirmative for most sections of the North. The clay belt adjoining Lake Superior is exceedingly well adapted to the production of small grains and peas. Barley, oats, wheat, rye and peas have given yields on our station farms much above the average. In 1915 on the demonstration station at Superior oats yielded eighty bushels per acre, barley forty-five bushels, spring wheat thirty-five bushels, and peas twenty-five bushels. At Ashland yields were fully as high. In central Wisconsin on the loam soils at Conrath and Marshfield barley and oats gave very good yields, nearly, but not quite, as high as was recorded for the red clay belt. The sandy and sandy loam types are not quite so well adapted to growing grains. On Plainfield sandy loam at Spooner, in 1915, our oats averaged over fifty bushels per acre for the best varieties. For the light types of soil our experimental work indicates that soy beans are exceedingly well adapted to be grown for concentrates for dairy cattle. On those types of soil it is possible to mature corn for the crib. Ear corn, when ground with soy beans, makes a fine concentrated feed for dairy cattle.

Pasturage grows on most soils of the North, and, owing to the fact that rainfall is a little more abundant during the summer months than is true in the regions farther south, pasturage holds out through the summer better than it does in more southerly localities. This is true on all except very light soils. Good pasturage is usually available from the middle of May to the first of June and lasts until November. The quality of the pasturage is usually good, since the legume plants are abundant and June grass is found everywhere. We do not wish to leave the impression that conditions as described are true for the entire acreage of undeveloped land in the North, but it holds for the greater part of it. With the facilities for growing legume crops of high feeding value, corn silage and roots, small grains, peas and soy beans for concentrates, and plenty of wild land available to develop into pastures, the conditions are favorable for dairying in the North.

This conclusion is not derived merely from the data procured during the ten years' work done at the different branch and demonstration stations, but to quite an extent from the results obtained by dairymen throughout the area described. Good dairy farms are found in practically all northern counties. Some of the finest and most productive herds in Wisconsin are located north of the forty-fifth parallel. Conditions are favorable for the production of high-class butter and cheese and it is a noteworthy fact that in recent years the cheese factory and the creamery have followed closely on the heels of the settler. The northern Wisconsin farmer has shown a disposition to co-operate with his neighbor. This is clearly indicated by the testing associations, live stock breeders' associations, bull clubs, potato warehouses and many other organizations requiring the right spirit of co-operation on the part of the farmer. Considering the fact that by far the greater number of settlers were men of very limited means and often of even more limited training as farmers, it is remarkable that such advance has been made. The future development of the dairy industry in northern Wisconsin will be greatly helped by an influx of settlers knowing something of farming. Cheap money on easy terms is also needed to help the settler clear the land and stock the farm with good stock. The northern half of the state, in common with all new regions, is lacking in available capital. Associations to remedy this condition have been established in certain counties, as in Marinette and Eau Claire, for instance. A system of rural credits, whether carried on under government, state or private direction, or combinations of these, is greatly needed to help towards a more rapid development of northern Wisconsin's latent agricultural resources.



Farmers are Tobacco-Wise

They know real quality in tobacco leaf when they chew it. That's why they always use PIPER HEIDSIECK chewing tobacco. The plug is convenient, handy, easy to carry—and this wonderfully mellow, rich White Burley leaf with the famous "champagne flavor" gives them a reliable *taste* and *satisfaction* they can get no other way.

PIPER Heidsieck
CHEWING TOBACCO (CHAMPAGNE FLAVOR)

is the favorite of thousands upon thousands of farmers, judges, lawyers, doctors—men prominent in all walks of life. Its use gives a man tobacco *enjoyment* in its supreme form. Begin using "PIPER" *this week;* you'll be a "PIPER" user always.

Buy "PIPER" by the Box and you'll always have a supply handy. For your convenience we pack "PIPER" in 2-lb. boxes of 36 separate foil-wrapped 5c Cuts; also in 2-lb. boxes of 18 ten-cent cuts.

Sold by dealers everywhere, in all size cuts from 5c up

Fruits and Garden

New Uses For the Potato.

Unless We Can Profit by Germany's Efficiency in Handling Crop, Big Crops in This Country Will Be Unprofitable.

A DISCOURAGING feature of potato growing is the occasional big crop which produces such an enormous quantity of potatoes, a big per cent of which go to waste or are sold at small profit. Dr. H. E. Horton discussed this phase of the potato industry at Madison, Farm and Home week. Facts presented in his address show that we have not as yet begun to realize the possibilities of the potato crop either from the standpoint of production or the uses to which the tubers may be put. The Germans have solved these problems better than any people in the world. Statistics given by Dr. Horton, show that the Germans waste only 10 per cent of the potato crop. The latest authentic figures on production in Germany show that about 1,500,000,000 bushels are grown annually on 8,151,000 acres. The acreage in this country in 1912 was 3,711,000 and the production 420,000,000 bushels in round figures. Thus in the matter of production we get about one quarter as many potatoes off the same acreage as the Germans get. But this is not our biggest potato problem now, as such crops as are raised in Germany would simply swamp our American markets. The following statement shows what distribution Germany makes of her tremendous crop:

440,000,000 bu. used on table.
91,833,333 bu. made into alcohol.
51,426,666 bu. made into starch.
191,013,333 bu. used for seed.
646,506,666 bu. used for feeding cattle.
157,953,333 bu. lost. (Only 10 per cent of total production.)

The potato furnishes 25 per cent of the food for the German Empire. In the families of German working people potatoes constitute 50 per cent of the food consumed. While the drying of potatoes into "potato flakes" is almost an unknown art in the United States, in Germany it is a profitable business. In Germany potato flour is in general use and other European countries also use it. Cook books are published showing how potato flour may be used. In 1913 we imported over 16,000,000 pounds of potato flour and starch for the use of people who come here from Europe. The war has cut off this supply, according to Dr. Horton, but the demand is still here, and there is no reason why Americans should not utilize potatoes for these purposes. Unsalable potatoes and culls might be thus turned into a good profit. Potato flakes, Dr. Horton says, may be turned almost instantaneously into mashed potatoes, the American national dish. Such flakes put up in cartons could be readily sold at all stores. Potato flakes would become indispensable in the army and navy. Potato flakes could also be made a very valuable food for farm animals. Horses, according to Dr. Horton, eat these flakes readily. Colic is less common and the feed agrees with horses. The same good effect of potato flakes might be found were they fed to swine. Potatoes lack protein and this substance must be supplied by one of the other ingredients of the ration. This is true of other starch foodstuffs.

Dr. Horton says that we must consider the matter of manufacturing potato flakes, starch, alcohol, etc., to get the best market for all grades of potatoes. In this manufacture of starch and alcohol there is a considerable pulp remaining which has a feeding value which should not be overlooked. When we get to the point where the potato is studied and its every product used as in Germany, our big potato crops will not give us such a scare as they do today.

LA CROSSE COUNTY GRAIN SHOW.

The annual Farmers' Course and Homemakers' Conference was held at La Crosse County School of Agriculture and Domestic Science, February 3d, 4th and 5th. There were over 800 people present during the three days. At the close of the session was held the first La Crosse County Country Life Conference, under the direction of Prof. C. J. Galpin, of Madison. The La Crosse county order of the agricultural experiment association held its annual corn and grain show at the same time and there was an exhibit of graded school sewing. A horse show added to the interest of the sessions. The homemakers' program was in charge of Mrs. Elizabeth Kelley, of Madison.

As usual, the La Crosse county exhibitors upheld their reputation as producers of prize-winning corn and small grain. It is doubtful whether any better display of farm products has been gathered in Wisconsin this year. Adverse season conditions seem to have made very little difference to the producers of prize-winning grains in La Crosse county. Alfalfa played a prominent part in the show and a special exhibit of legumes attracted attention. S. P. Markle, of La Crosse, swept the boards with his corn, which also won honors at the National Corn Show in St. Paul and the Wisconsin Grain Show at Madison. The sewing

CORN

High grade, high testing Wisconsin and Minnesota grown Seed Corn. The kinds that will surely ripen in 1916. We have lots and lots of it. Pedigree strains.

OATS, WHEAT, SPELTS, BARLEY

A quartette of giants! Great money makers! Bred to health, stooling qualities, stiff, strong straw, big yields—all registered pedigree varieties endorsed by Agricultural Stations. Largest Seed Potato grower in America!

ALFALFA, SWEET CLOVER, SUDAN AND BILLION $ GRASS

A quartette invincible. The first two made possible to grow and flourish on every farm in the United States, owing to Salzer's hardy strains—the last two growing 60 tons hay richer than Timothy in 10 weeks time on 10 acres!

SALZER'S SEED CATALOG (184 Pages)

For 43 years it has stood for quality in Farm and Vegetable Seeds. Brimful of good things! It's free for the asking. A postal will bring it to you. Send for it.

Olds' White Kherson

Best Bushel White Oats at International Dry Farming Congress, Wichita, Kan., 1914 and 1915, as Grown and Exhibited by H. E. Krueger, of Pedigree Barley Fame.

A new, early oat. Similar to Kherson but white instead of yellow. Mr. Krueger says, "2 weeks earlier than Wis. Pedigree No. 1 and yielded 20 bushels more." He reports a yield the past season of **108 bushels per acre, average for 30 acres.**

Others who have tried it say—
"Yielded double what most oats did."
"Stood up the best on rich soil."
"28 bushels ahead of Swedish Select."

exhibit was a great credit to the school and teachers of La Crosse county. Immediately following the La Crosse show the winning exhibits were forwarded to Madison.

In the corn classes S. P. Markle won first on Wisconsin No. 7; sweepstakes on ten ears any Dent variety; sweepstakes single ear, any Dent variety; first on best fifty ears of White Dent; largest ear of corn entered; sweepstakes best fifty ears Dent corn. John Van Loon won first on best ten ears Golden Glow; first on best single ear White Dent; first on best single ear Yellow Dent; first on best ten ears sweet corn. Gust Olson won first on best ten ears any other yellow variety. Otto Wolf won first on Wisconsin No. 6. Jippa Wielinga won special prize for first fifty ears of corn, any Yellow Dent variety. J. E. Hauser won first best ten ears Flint corn and first best ten ears sweet corn, early variety. J. Staples won first on ten ears pop corn.

Wm. Moos showed best peck Wisconsin pedigreed oats and Ed Peters best peck oats any other variety. Mr. Peters also won first on best peck Wisconsin pedigreed barley and Otto Wolf first on best peck barley any other variety. Otto Wolf also won first on barley in sheaf. Harry Pralle had best peck of rye any other than pedigreed variety. In the small grain classes Ed Peters won first on best rye in sheaf; first on best peck spring wheat; first on best wheat in sheaf. Harry Pralle won first on best peck winter wheat. The best bundle of alfalfa was shown by John Van Loon and the best peck of potatoes, any variety, both early and late, by Ed Peters. Peters also had the best display of farm products. The greatest amount of cash, as prizes on pure-bred corn, was won by S. P. Markle. Sweepstakes on small grains were, oats, Wm. Moos; barley, Wm. Moos, and rye, Harry Pralle.

YELLOW LEAF ON CHERRIES.

To the Editor:—I grow some fruit and take a great interest in the year book of the Wisconsin Horticultural Society, and also the society paper. We can grow very fine fruit of all kinds in this county, including apples, pears, plums and cherries. But it is hard to keep the insects away, especially with the cherries. The yellow leaf is killing them and already hundreds of trees are dead. There has been a good deal of spraying done, but our greatest trouble seems to be to find cut just the right time to spray, so that it will do any good. So far I have not made a great deal from my fruit. I started to plant an orchard twelve years ago. I planted a number of trees which had to be pulled out again and some died. If I had known twelve years ago what I know now I should have had a fine orchard by this time. Apples do fine here, especially the Dudley, Wealthy, Northwestern Greening, Duchess, Scott's Winter, Snow, McManus and the Wolf River.

Door Co., Wis. C. Saabye.

INSTITUTE A GRAND SUCCESS.

To the Editor:—Our institute was a grand success in every way. We had a fine attendance both days and at one time there were 325 ladies present by actual count in the women's institute.

There were thirty-one head of registered cattle on exhibit, 156 entries of corn, potatoes and grain and clover seed, fifty-six entries in the women's department or cooking school exhibits. We served about 800 people with a free lunch and provided free barn room for 182 horses.

Unusual interest was manifested by the farmers and we believe great good will come from this institute.

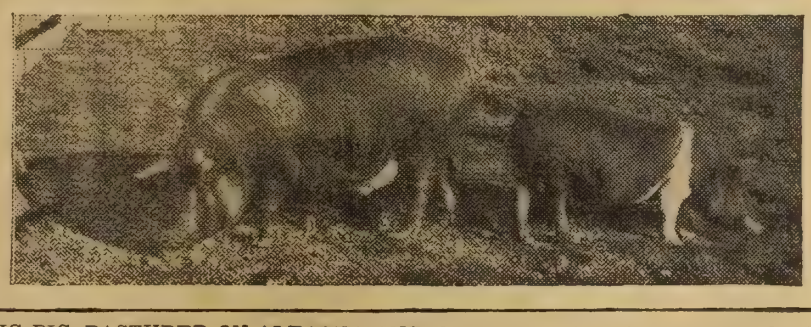
Wm. Drenk.

Waushara Co., Wisconsin.

CAFETERIA PLAN FOR HOGS.

(Continued from page 10.)

the hog does not consume the high-priced concentrates in such excessive quantities as to make his gains expensive, but, on the other hand, even with tankage at $50 a ton, the consumption of this food in quantities regulated wholly by the appetite of the hog means cheaper gains than can be made from corn alone or from corn and tankage mixed together in any fixed quantity. The conclusion is reached that the hog's ration varies slightly from day to day. Beginning at weaning time and ending when he is fit for market, there is a gradual, and it may be said daily, widening of the ration, and the series of experiments now being conducted by the Iowa station have already demonstrated that the hog, when left to his own resources, knows what is best for him, and fortunate it is that his natural appetite, when gratified, leads to the making of cheaper gains than can be put on by any other plan of feeding.



BIG PIG, PASTURED ON ALFALFA AND SELF-FED CORN, WEIGHS 185 AT SIX MONTHS, WHILE LITTLE PIG, PASTURED ON ALFALFA AND 1 PER CENT CORN RATION, WEIGHS 116 POUNDS AT SAME AGE.

Get Stumps Out With Less Work

Pulling stumps is slow and costly. "An explosive reduces the labor of clearing land to the minimum. It may be used by any intelligent man," says Minnesota Farmers' Bulletin 134. Get any stump out quickly, and at the same time split it into pieces easily handled, by using

Atlas Farm Powder
THE SAFEST EXPLOSIVE
The Original Farm Powder

Atlas Farm Powder is made especially for farm use. It is easy to use—no experience needed. Just bore a hole, load, fire, and work that otherwise would take hours or days is done instantly! Ask your dealer about Atlas Powder today.

You can save money and make money by using Atlas Farm Powder to blast out stumps and shatter boulders, break up hard-pan, do ditching and dig holes for trees or posts. It is the cheapest farm hand you can possibly find.

The Wheat Yield Tells the Story

of Western Canada's Rapid Progress

160 ACRE FARMS IN WESTERN CANADA FREE

The heavy crops in Western Canada have caused new records to be made in the handling of grains by railroads. For while the movement of these heavy shipments has been wonderfully rapid, the resources of the different roads, despite enlarged equipments and increased facilities, have been strained as never before, and previous records have thus been broken in all directions. The largest Canadian wheat shipments through New York ever known are reported for the period up to October 15th,

upwards of four and a quarter million bushels being exported in less than six weeks,

and this was but the overflow of shipments to Montreal, through which point shipments were much larger than to New York.

Yields as high as 60 bushels of wheat per acre are reported from all parts of the country; while yields of 45 bushels per acre are common.

Thousands of American farmers have taken part in this wonderful production. Land prices are still low and free homestead lands are easily secured in good localities, convenient to churches, schools, markets, railways, etc.

There is no war tax on land and no conscription.

Write for illustrated pamphlet, reduced railroad rates and other information to

POULTRY

THIS department is edited by a competent poultryman, who will be pleased to answer questions concerning diseases, poultry management, etc., when they can be answered through the department. Questions will not, however, as a rule, be answered by mail, and stamps need not, therefore, be inclosed with inquiries. Address all letters relating to poultry topics to this office.

LICE AND MITES.

One of our subscribers, Mrs M. L. Brend, of Calumet county, who is interested in giving her little chicks a start in life free from lice, writes The Wisconsin Farmer as follows:

I have been reading your paper with much interest and especially the poultry department, as I am anxious to succeed with my chickens. Last year I had considerable trouble with lice and mites and last many of my little chicks as a result. Can you advise me what is the best method to use in ridding them of these parasites this spring?

The experience of Mrs Brend with lice and mites has been the experience of hundreds of other poultry fanciers and farm women. These two parasites cause the death of many thousands of newly hatched chickens in Wisconsin every year and it is advisable at this time to rid the flock of them and give the little chicks a start in this world free from either. The farm woman should be on the alert now for these parasites as lice on baby chicks may sometimes be prevented by dusting the hens several times while the chicks are hatching, but even when these precautions are taken some of the eggs on the hen's body may hatch and thus the chicks become infested. Lice are not usually as harmful as mites, but many broods of chicks are often badly injured and some are killed by these pests. Not infrequently hens desert their nests and the eggs are spoiled because of the ravages of lice.

When the chicks are hatched and lice are noticed they may be eradicated by greasing the chicks on the top of the head, an old remedy known to most poultry raisers; by dusting the sitting hens at least three times during the hatching period; by using blue ointment or grease on all other hens and by providing a good dust wallow. Use insect powder for the dust, which method kills the lice by suffocating them, or knocks them off the body of the hen where they soon die. The liberal use of this powder at least three times is usually effective, while one dusting is not sufficient. Care should be taken that no powder gets into the eyes of the hen and be sure to fill her feathers with the powder. This done to the setting hen, the others should be treated and a louse paint fumigation of the henhouse and nests will help to rid the premises of them so the little chicks will not be infested.

The common chicken mite is the most common of all external parasites of poultry. Setting hens are frequently killed by mites while laying hens usually cease laying and become poor in flesh. They prove very deadly to the little chicks and they attack the chicks as soon as they are hatched and suck up so much of their blood that the chicks die. Most poultry fanciers realize the destructive habits of mites and are on the constant lookout for them. Once they have gotten a start in the henhouse or coops they are hard to eliminate and spraying or fumigating the house are the best methods. Unless the house can be tightly closed fumigation will not result successfully. Whitewash, crude oil, coal tar disinfectants, crude carbolic acid and various other mixtures are effective sprays. Also be careful to remove all litter in which they can hide and the poultry raiser who wishes to have the best results must combat these two common parasites. Hen-hatched chicks are more likely to be troubled with lice than incubator-hatched and artificially brooded chicks, but in every case precautions should be taken, as prevention is far better than cure.

LIKES OUR POULTRY COLUMNS.

To the Editor:—I wish to congratulate The Wisconsin Farmer for the excellent work they are doing for poultry. Many valuable lessons for us all have appeared in their columns which should be put into practice.

People say to me, "We have taken care of poultry since childhood and these things are good enough to read about, but they don't pay for the bother."

If you have not already, try some of these suggestions and see if it doesn't pay to have a year-around income from your chickens.

We are now on the last half of another cold winter, fraught with many disturbances because of the prevailing epidemic and the frailties of mankind to combat with atmospheric conditions; a winter long to be remembered by many of us to whom it has brought a full cup of sickness and death. But what of the poultry? Have they also been assailed by the la grippe and pneumonia? This has been a season to test the feasibility of the open-front poultry house and many a disbeliever in the fresh-air system must have been converted to the desirability of such a house as a means of rugged health for his birds.

If only we could contrive a head covering for the male to protect his comb and wattles and a drinking fountain that he could drink from and not drip water to freeze on his wattles

Appreciation of the Poultry Columns of The Wisconsin Farmer.

I WISH to congratulate The Wisconsin Farmer on the excellent work it is doing for poultry. Many valuable lessons for us all, which should be put into practice, have appeared in its columns.
Mrs. A. J. Schloerb,
Winnebago Poultry Yards, Omro, Wis.

Mrs. Schloerb is well known to Wisconsin farmer-poultry-raisers. She is acknowledged to be one of the best-posted poultry fanciers in the state and has taken a very active interest in her home community in organizing young people for raising better poultry.

Compound Incubators Get Bigger Hatches

Any Place—Any Time—Any Climate

These famous Metal covered machines make big money every year for poultry raisers. High quality material, superior construction, simplicity and ease of operation all combine to give the greatest hatching value.

Don't Pay Two Prices

In this incubator you get the greatest hatching value at the lowest possible price. Will last a life time.

C. P. Shirey, writes: I hatched 220 chicks from 222 fertile eggs. I have not done this with any other machine and I have tried a number.

Made in All Sizes

FREE 1916 Catalog FREE

Don't buy an incubator anywhere at any price until you get our new 1916 catalog and rock bottom prices. You owe it to yourself to know all about this wonderful incubator. Write today—sure.

WARSAW INCUBATOR CO.
Box 233, Warsaw, Ill.

these cold days when the temperature drops to 20 degrees below zero.

We have solved the question of freezing fountains—a small patent lamp, perfectly safe, that consumes but a mite of oil, does away with all dishes of frozen drinking water, but only with the utmost care do combs and wattles escape freezing in this cold climate.

There is no question but that the birds housed with open fronts and perfectly dry quarters are able to endure the cold and thrive to the best of advantage. All houses are not constructed just right for the open front to preserve the comb of the males from being frosted.

The question of proper ventilation for different styles of poultry houses should be carefully studied and I believe more attention should be given this subject in these agricultural institutes where "poultry for profit" is discussed, especially in these severe cold climates I believe ventilation should be better understood by poultry raisers.

I remember attending a poultry institute last winter in February when the topic of ventilation was brought up. At this institute there were over 100 birds on exhibition which had been brought in from the near-by farms. A part of the male birds shown here did not have frozen combs or wattles.

We tried to get these farmers to tell us about the construction of their houses or their plan of housing birds with these perfect combs, but we were unable to draw out this very valuable knowledge we all so much wished to know. We learned that some of these birds did not go out doors in the winter, having the run of large barns and stables. Others were allowed to go out of their feeding and roosting quarters when they pleased. All the farmers complained of no egg yield in the winter.

There's a science of housing and a science of feeding that has to come to the people who keep poultry and this intimate knowledge must be gained before the hen can possibly do her best.

The virus of good care, feeding and housing of cows has entered the very soul of the successful dairyman and he is getting results so far ahead of the old-time plan that the man who now holds to the ancient regime is scoffed at. Just this same revolution in poultry will bring about the greater profits and the hen will be able to do her share of the mortgage lifting.

Our poultry houses at the Winnebago yards were not all built for the best arrangement of the open front plan. We have always left windows open day and night, used curtains at night in cold weather to divert the drafts and cloth cover for windows in daytimes if weather is too severe.

One should have no trouble with colds whatever with the right number of birds in a dry, pure-air pen.

Sometimes a crowded condition will undo all other precautions. You should resolve never to overfill a pen. Better use the ax at once and have a few perfect specimens than to weaken the constitution of many.

We have been dissatisfied with several plans of ventilation which were suggested to us and which we tried out.

We are now following, so far as practicable, the ventilation system used in some of the houses of the experiment station at the state university at Madison, Wisconsin, and like it so much better than any other that we shall probably make no further changes. This system is not much unlike that used in the fool-proof poultry houses used at Mountain Grove, Missouri, experiment station.

This fool-proof house is one of the best and simplest style of a commonsense, inexpensive protection for poultry. In order to make it more comfortable up here in this frigid climate a little more lining back of the roosts and a cloth curtain over the lattice windows in front would improve it.

Judging from the questions some people ask, I am led to believe that there is a great lack of observation among those who raise poultry simply as a side issue, satisfied with just hens of any sort.

Careful attention to the condition of individual birds would prevent the inroad of any disease or of vermin that sap the life from an otherwise healthy flock of chickens.

You know the old adage about "An ounce of prevention, etc." Very often these serious troubles that come to poultry could be prevented by curbing the very beginnings of it, at which time, perhaps, it was scarcely noticeable.

Speaking of being observing reminds me of a story I read once.

"I think that children are not so observing as they used to be," said a member of the school board to a teacher whose class he was visiting.

"I hadn't noticed it," replied the teacher.

"Well, I'll prove it to you," answered the committeeman.

Turning to the class he said: "Someone give me a number."

'Forty-two," said a little girl eagerly.

He wrote "twenty-four" on the board. Nothing was said.

"Well, someone else give me a number."

"Eighty-three," said another child.

He wrote "thirty-eight" on the board and smiled knowingly at the teacher. When nothing was said he called for a third number and fairly gasped at the indignation manifested by a small, red-faced urchin, who said: "Eighty-eight, and see if you can change that." Mrs. A. J. Schloerb.

Omro, Wisconsin.

MENTHOL IN VASELINE FOR ROUP.

To the Editor:—I note so many poultry raisers have no sure cure for roup. I will give you one which has proved very successful. Mix enough menthol in vaseline to make it fairly strong and penetrating, then grease the head of the fowl, also give about five drops of common coal oil once a day. Keep your drinking vessels supplied with enough coal oil to cover the water and good night roup.

Remove all sick chickens and keep in a separate place. We wrap our roosts with burlap and keep it saturated with crude oil and when the chickens go to roost the lice crawl down on their legs and come in contact with the oil, which is sure death to mites and lice. This oil will also cure scaly legs with one or two applications. The surest way to get a good hatch is to paint the nests with crude oil a day or two before setting a hen and after hatching keep the hen and chicks in a box treated in like manner. I do not believe you could find a louse on any of our poultry. We have used this method for three years. A. C. Ladely.

Department of Agriculture chemists are examining samples of new foods from animal bone and blood invented since war began by a German scientist at Cologne. Bozivan is the name given to the blood food. The German ministry of trade and industry is investigating the scientist's claims that he has developed nourishing foods. Samples of the foods were sent to the United States by an American consul in Germany.

Stumps Out—Quick and Easy

Here at last is the land clearing device you have been looking for—the Kirstin One-Man Stump Puller—a simple, powerful, practical Puller that one can handle and operate with ease. No big, expensive, cumbersome outfit—no horses to drive—no extra work of any kind. With the Kirstin, one man *alone* clears land quickly, easily, economically. Costs little to begin with—nothing for upkeep—and costs far less to operate than any other hand or horse power puller on the market. In the

Kirstin One-Man Stump Puller

you get every quality needed for land clearing—*strength, power, speed.* The Kirstin is the only stump puller with variable speeds. This gives you a big advantage—saves much time. To start the tough stumps, you have enormous *power*: then when the stump breaks loose, a turn of a wrench gives *greaterspeed.* Any and all kinds of stumps—big, little, green, dry, tough—also trees and hedges—are pulled quick and easy. The Kirstin holds the record for lowest cost of operation. Prove our claims by

Ten Days Try-Out on *Your* Farm

With the Improved Double Leverage Kirstin you can clear over an acre from one anchor. Also no time wasted in frequent re-setting of puller. The Kirstin is designed to save time. When you get a Kirstin you get a complete, practical Stump Pulling Outfit *at little cost*—and you are protected by the *Kirstin Iron-Clad Guarantee.*

The Kirstin can be used anywhere—on hillsides, in swamps and on rough ground or in thick timber where no other puller could be used. The Government uses Kirstins—so do several of the State Experiment Stations—and thousands of land owners from Maine to California and from Canada to the Gulf are loyal boosters for the Kirstin because it has **demonstrated its superiority** as a land clearing device. If you have only a couple of acres of stump land you can't afford to let it lay idle. Get a Kirstin now—clear out those stumps—make your idle land pay you a profit.

Get the Kirstin Catalog—Today!

Any one having stump land should get this valuable **free** book at once. It tells all about the wonderful Kirstin One-Man Stump Puller, the Kirstin Service Bureau, the Payment Plans and fully explains easiest, best, cheapest way to clear your land.

Wisconsin Wins In Big Hatching Contests Every Year

Why Pay More

For only $10 you can get these two prize winning machines, delivered, freight paid east of the Rockies. You take no risk—money back if not satisfied. You can order direct from this ad. Ask the publisher about us.

Both Machines Freight Paid for Only $10

We also furnish 180 Egg Incubator and 180 Chick Brooder both for only $12

Wisconsin Incubators have long proved their wonderful hatching qualities. Competing with every make known, they won in the five big annual National Hatching Contests. Think of it. Five consecutive victories. That certainly proves you can't make a mistake. Shipped on **30 Days' FREE Trial**

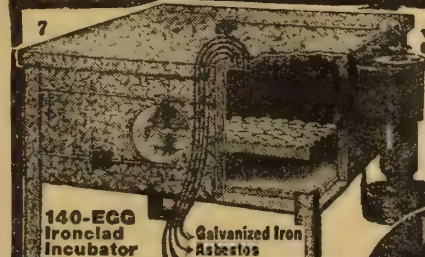
MONEY BACK IF NOT SATISFIED

10-YEAR GUARANTEE

Wisconsins have hot water heat, double walls, double glass doors, copper tanks and boilers, self-regulating. Nursery under egg tray. Made of finest, select, clear **CALIFORNIA REDWOOD,** not pine, paper or other flimsy material. Incubator finished in natural color—not painted to cover up cheap, shoddy material. Incubator and Brooder shipped complete with thermometers, egg tester, lamps, everything but the oil. This is the best outfit you can buy. If you don't find it satisfactory after 30 days' trial, send it back. Don't buy until you get our new 1916 catalog, fully describing this prize winning outfit. WRITE FOR IT TODAY. You can't make a mistake in buying a Wisconsin. On the market 15 years.

WISCONSIN INCUBATOR COMPANY, Box 102 Racine, Wis.

Ironclad TRADE MARK Wins in the Two BIGGEST HATCHING Contests Ever Held



Why take chances with untried machines when for only $10 we guarantee to deliver safely, all freight charges paid (East of Rockies) BOTH of these big prize winning machines fully equipped, set up ready for use? Why not own an **Ironclad**—the incubator that has for two years in succession won in the **greatest hatching contests ever held.** In the last contest conducted by Missouri Valley farmer and Nebraska Farm Journal, 2000 machines were entered, including practically every make, style and price. With 140 egg Ironclad—the same machine we offer with Brooder, freight paid, for only $10, Mrs. C. F. Merrick, Lockney, Texas, hatched 148 chicks from 148 eggs in the last contest.

140-EGG Ironclad Incubator

Don't class this big, all metal covered, dependable hatcher with cheaply constructed machines. Ironclads are not covered with cheap tin or other thin metal and painted like some do to cover up poor quality of material. Ironclads are shipped in the natural color—you can see exactly what you are getting. Don't buy any incubator until you know what it is made of. Note these Ironclad specifications. Genuine California Redwood, triple walls, asbestos lining, galvanized iron covering. Large egg tray, extra deep chick nursery—hot water top heat, copper tanks and boiler, self regulator, Tycos Thermometer, glass in door and many other special advantages fully explained in Free Catalog. Write for it TODAY or order direct from this advertisement.

HEPSEY BURKE--A Sister to David Harum

By G. N. Wescott, the Brother of the Author of "David Harum."

(Copyright 1915.)

SYNOPSIS.

Hepsey Burke with the Junior Warden met the new pastor, Donald Maxwell, at the depot, giving him a welcome to his new parish. During the ride out to Thunder Cliff, Hepsey's home, she gave Maxwell in her outspoken way a very clear idea of the requisites or, as she put it, what the "parish wanted in the shape of a pastor." Having arrived at Thunder Cliff, Maxwell settled himself in the room assigned to him and then while resting read a letter from "Betty." However, he decided not to tell Mrs. Burke of her just yet. The new pastor's first call was upon the Senior Warden, receiving a hearty welcome from Virginia Bascom, his daughter. Hepsey surmised that Maxwell was engaged and made a neighborly call upon Jonathan Jackson, the Junior Warder, to see what he thought about the matter.

CHAPTER VI—Continued.

Several segments of the circle giggled violently. The essayist, though very red, made a brave effort to ignore the highly indecorous interruption and so continued with trembling tones:

"What more beautiful and touching thing is there than the innocent, unsullied modesty of childhood? One might almost say——"

But she never said it, for here again she was forced to pause while another pair of immodest legs appeared over the eaves, much fatter and shorter than the preceding pair. These belonged to Nickey's boon companion, the gentle Oliver Wendell Jones. The rest of O. W. J. followed in due time; and, quite ignorant of what awaited him, he began his wriggling descent. Most unfortunately for him the hem of his nightshirt caught on a large nail in the eaves of the roof; and after a frantic, fruitless and fearful effort to disconnect himself, he hung suspended in the breeze for one awful moment, like a painted cherub on a Christmas tree, while his mother, recognizing her offspring, rose to go to his assistance.

Then there was a frantic yell, a terrible ripping sound and Oliver Wendell was seen to drop to the ground clad in the sleeves and the front breadth of his shirt, while the entire back of it, from the collar down, waved triumphantly aloft from the eaves. Oliver Wendell Jones picked himself up, unhurt, but much frightened and very angry, presenting much the aspect of a punctured tire. Then suddenly discovering the proximity of the missionary circle and missing the rear elevation of his shirt about the same time, in the horror and mortification of the moment, he lost his head entirely. Notwithstanding the protests of his pursuing mother, without waiting for his clothes, he fled "anywhere, anywhere out of the world," bawling with wrath and chagrin.

The entire circumference of the missionary circle now burst into roars of laughter. His mother quickly overtook and captured Oliver, tying her apron around his neck as a concession to the popular prejudice against "the altogether." The gravity of the missionary circle was so thoroughly demoralized that it was impossible to restore order; and Miss Bascom, in the excess of her mortification, stuffed the rest of her manuscript, its eloquent peroration undelivered, into her bag.

When the last guest had departed Mrs. Burke proceeded to hunt up Nickey, who was dressed and sitting on the corncrib whittling a stick. His mother began:

"Nicholas Burke, what in the name of conscience does all this idiotic performance mean; I'd like to know?"

Nickey closed his knife. Gazing serenely down at his mother, he replied:

"How'd I know the blamed missionary push was goin' to meet on the front porch, I'd like to know? Me and Oliver Wendell was just playin' the house was on fire. We'd gone to bed in the front room and then I told Ollie the fire was breakin' out all around us and the sparks was flyin', and the stairs was burned away, and there was no way of 'scapin' but to slide down the rope over the roof. I ain't to blame for his night shirt bein' caught on a nail and bein' ripped off him. Maybe the ladies was awful shocked, but they laughed fit to split their sides just the same. Mr. Maxwell laughed louder than 'em all."

Hepsey retired hastily, lest her face should relax its well-assumed severity.

Maxwell, in the meantime, felt it a part of his duty to console and soothe the ruffled feelings of his zealous and fluent parishioner and to Virginia's pride his offer to escort to Willow Bluff was ample reparation for the untoward interruption of her oratory. She delivered into his hands, with sensitive upward glance, the receptacle containing her manuscript and set a brisk pace, at which she insured the passing of the other guests along the road, making visible her triumph over circumstance and at the same time obviating untimely intrusion of a tete-a-tete conversation.

"You must have given a great deal of time and study to your subject," remarked Maxwell politely.

"It is very near to my heart," responded Virginia, in welling tones. "Home life is, to me, almost a religion. Do you not feel, with me, that it is the most valuable of human qualities, Mr. Maxwell?"

"I do, indeed, and one of the most difficult to reduce to a science,"—she glanced up at him apprehensively, whereupon, lest he seemed to have erred in fact, he added,—"as you made us realize in your paper."

"It is so nice to have your appreciation," she gurgled. "Often I feel it almost futile to try to influence our cold parish audiences; their attitude is so stolid, so unimaginative. As you must have realized, in the pulpit, they are so hard to lead into untrodden paths. Let us take the way home by the lane," she added coyly, leading off the road down a sheltered by-way.

The lane was rough, and the lady, tightly and slightly shod stumbled neatly and grasped her escort's arm for support—and retained it for comfort.

"What horizons your sermons have spread before us—and, yet,"—she hesitated—"I often wonder, as my eyes wander over the congregation, how many besides myself, really hear your message, really see what you see."

Her hand trembled on his arm and Maxwell was a little at a loss, though anxious not to seem unresponsive to Virginia's enthusiasm for spiritual vision.

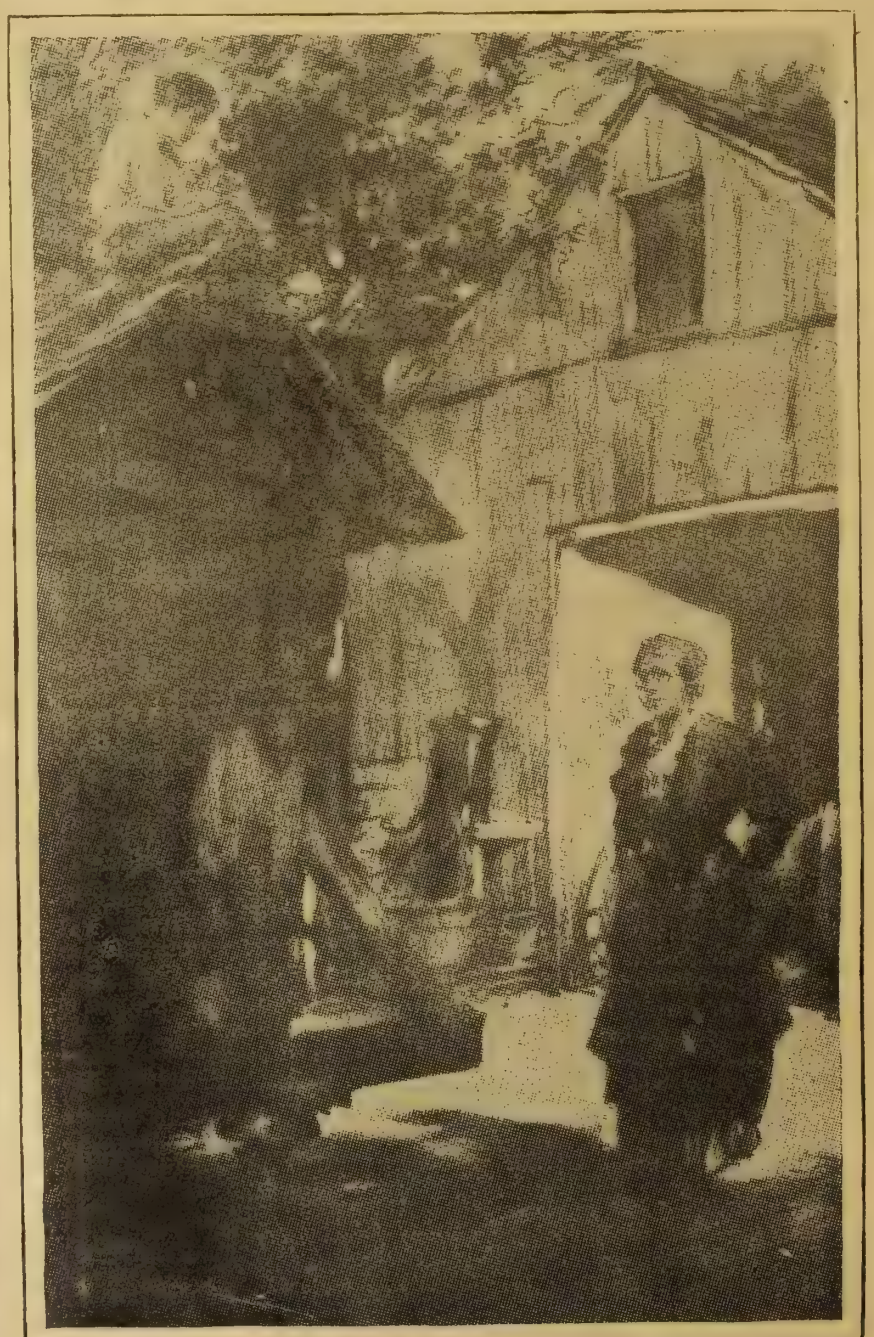
"I feel that my first attention has to be given to the simpler problems here in Durford," he replied. "But I am glad if I haven't been dull in the process."

"Dull? No indeed—how can you say that! To my life—you will understand?" (she glanced up with tremulous flutter of eyelids) "—you have brought so much helpfulness and—and warmth." She sighed eloquently.

Maxwell was no egotist and was always prone to see only an impersonal significance in parish compliments. A more self-conscious subject for confidences would have replied less openly.

"I am glad—very glad. But you must not think that the help has been one-sided. You have seconded my efforts so energetically—indeed I don't know what I could have accomplished without such whole-hearted help as you and Mrs. Burke and others have given."

To the optimistic Virginia the division of the loaves and fishes of his personal gratitude was scarcely heeded. She cherished her own portion and soon magnified it to a basketful—and soon, again, to a monopoly of the entire supply. As he gave her his hand at the door of Willow Bluff she was in fit state to invest that common act of friendliness with symbolic significance of a rosy future.



"NICHOLAS BURKE, WHAT IN THE NAME OF CONSCIENCE DOES ALL THIS IDIOTIC PERFORMANCE MEAN, I'D LIKE TO KNOW?"

CHAPTER VII.

Hepsey Goes A-Fishing.

MRS. BURKE seemed incapable of sitting still, with folded hands, for any length of time; and when the stress of her attention to household work, and her devotion to neighborly good deeds relaxed, she turned to knitting wash rags as a sportsman turns to his gun or a toper to his cups. She seemed to find more stimulus for thought and more helpful diversion in the production of one wash rag than most persons find in a trip abroad.

One day, not very long after the eventful missionary tea, she was sitting in her garden and knitting more

rapidly than usual as she said to Maxwell:

"What's been the matter with you these last few weeks? You've been lookin' altogether too sober and you don't eat nothin' to speak of. It must be either liver, or conscience, or heart."

Secretly she strongly suspected a cardiac affection of the romantic variety. She intended to investigate.

Donald laughed as he replied:

"Perhaps it's all three together, but I'm all right. There's nothing the matter with me. Every man has his blue days, you know."

"Yes, but the last month you've had too many and there must be some reason for it. There's nothin' so refreshin' as gettin' away from your best friends once in a while. I guess you need a change—pinin' for the city, maybe. Sakes alive! I don't see how folks can live that way—all crowded up together, like a lot of prisons."

"You don't care to visit in the city, then?"

"Not on your life!"

"But a change is good for everyone. Don't you ever get away from Durford for a few weeks?"

"Not very often. What with decidin' where to go and fussin' to get ready and shuttin' up the house, it's more trouble than its worth. Then there's so many things to 'tend to when you get home."

"But don't you ever visit relatives?"

"Not on your life, unless I'm subpoenaed by the coroner, though, of course, we do get together to celebrate a family funeral or a wedding now and then. Visitin' is no joke, I tell you. No sir, I'm old enough to know when I'm well off, and home's the best place for me. I want my own table and my own bed when it comes night." She paused and then remarked meditatively:

"I went down to visit in New York once."

"Didn't you enjoy your visit?" Maxwell inquired. "New York's my home city."

"Can't say I did, awful much. You see, I was visitin' Sally Ramsdale—Sally Greenway that was. They were livin' in an apartment, ninth floor up. In the first place, I didn't like goin' up stairs in the elevator. I was so scared I felt as if the end had come, and I was bein' jerked to my reward in an iron bird cage with a small kid dressed in brass buttons. When I got into the hall it was about two feet wide and darker than Pharoah's conscience. It had a string of cells along the side and one opened into a chimney and the rest into nothin' in particular. The middle cell was a dinin' room where we ate when we could find the way to our mouths. Near as I can recollect you got into the parlor through the pantry, back of the servant's room, by jumpin' over five trunks. You ought to have seen my room. It looked just like a parlor when you first went in. There was somethin' lookin' like a cross between an upright piano and a writin' desk. Sally gave it a twist and it tumbled out into a folding bed. The first night I laid awake with my eyes on the foot of that bed expectin' it to rise and stand me on my head, but it didn't. You took the book of poems off the center table, gave it a flop and it was a washstand. Everything seemed to shut up into something else it hadn't ought to. It was a 'now you see it and now you don't see it' kind of a room; and I seemed to be foldin' and unfoldin' most of the time. Then the ceilin' was so low that you could hardly get the cover off the soap dish. I felt all the while as if I should smother. My! but I was glad to get home and get a breath of real air."

"Yes," Maxwell replied, "people live more natural and healthful lives in the country. The advantages of the city aren't an unmixed blessing."

"That's true enough. That's no way to live. Just think of havin' no yard but a window box and a fire escape! I'd smother!

"We folks out here in the country ain't enjoyin' a lot of the refinements of city life; anyhow we get along, and the funny part about it is—it ain't hard to do, either. In the first place, we ain't so particular, which helps a lot, and besides, as Jonathan used to say—there's compensations. I had one look at Fifth Avenue and I'm not sayin' it wasn't all I had heard it was, but if I had to look at it three hundred and sixty-five days a year I wouldn't trade it for this.

"Why, some days it rains up here, but I can sit at my window and look down the valley to where the creek runs through and 'way up into the timber and the sight of all those green things, livin' and noddin' in the rain is a long ways from being disheartenin', and when the sun shines I can sit out here in my garden with my flowers and watch the boys playin' down in the meadow, Bascom's Holsteins grazin' over there on the hill, and the air full of the perfume of growin' things—they ain't got anything like that in New York."

For a time Mrs. Burke relapsed into silence, while Maxwell smoked his briar pipe as he lay on the grass near by. She realized that the parson had cleverly side-tracked her original subject of conversation and as she glanced down at him she shook her head with droll deprecation of his guile.

When she first accused him of the blues it was true that Maxwell's look had expressed glum depression. Now, he was smiling, and, balked of her prey, Mrs. Burke knitted briskly, contemplating other means drawing him from his covert. Her strategy had been too subtle. She would try a frontal attack.

"Ever think of gettin' married, Mr. Maxwell?" she inquired abruptly.

For an instant Maxwell colored, but he blew two or three rings of smoke in the air and then replied carelessly, as he plucked at the grass by his side:

"Oh, yes; every fellow of my age has fancied himself in love some time or other, I suppose."

"Yes, it's like measles, or whoopin' cough; every man has to have it some time, but you haven't answered my question."

"Well, suppose I was in love; a man must be conceited to imagine that he could make up to a girl for the sacrifice of bringing her to live in a place like Durford. That sounds horribly rude to Durford, but you won't misunderstand me."

"No; I know exactly how you feel, but the average girl is just dyin' to make a great sacrifice for some good-lookin' young fellow, all the same."

"Ah yes; the average girl, but——"

Maxwell's voice trailed off into silence, while he affected to gaze stonily into the blue deeps of the sky overhead.

Hepsey had thought herself a pretty clever fisherman in her day; evidently, she decided, this particular fish was not going to be easy to land.

"Don't you think a clergyman is better off married?" she asked, presently.

Donald knocked the ashes out of his pipe and put it in his pocket, clasped his hands across his knees and smiled thoughtfully for a moment. There was a light in his eyes which was good to see, and a light trembling of his lips before he ventured to speak. Then he sighed heavily.

"Yes, I do, on many accounts. But I think that any parson in a place like this ought to know and face all the difficulties of the situation before he comes to a definite decision and marries. Isn't that your own view? You've had experience of married parsons here. What do you think?"

"Well, you see the matter is just like this: Every parish wants an unmarried parson; the vestry 'cause he's cheap, every unmarried woman 'cause he may be a possible suitor; and it's easier to run him than it is a married man. He may be decent, well-bred and educated. And he comes to a parcel of ignoramuses who think they know ten times as much as he does. If he can't earn enough to marry on and has the good sense to keep out of matrimony the people talk about his bein' a selfish old bachelor who neglects his duty to society. He can't afford to run a tumble-down rectory like curs. If in the face of all this he marries he has to scrimp and stint until it is a question of buyin' one egg or two, and lettin' his wife worry and work until she's fit for a lunatic asylum. No business corporation, not even a milk-peddlin' trust, would treat its men so or expect good work from 'em. Then the average layman seldom thinks how he can help the parson. His one idea is to be a kicker as long as he can think of anything to kick about. The only man in this parish who never kicks is paralyzed in both legs. Yes sir, the parson of the country parish is the parish goat, as the sayin' is."

Mrs. Burke ceased her tirade and after awhile Maxwell remarked quietly:

"Mrs. Burke, I'm afraid you are a pessimist."

"I'm no such thing," she retorted hotly. "A pessimist's a man that sees nothin' but bad and says there's no help for it and won't raise a hand; he's a proper sour-belly. An optimist's a man that sees nothin' but good and says everything's all right; let's have a good time. Poor fool! The practical man—anyway, the practical woman—sees both the bad and the good and says we can make things a whole lot better if we try; let's take off our coats and hustle to beat the cars, and see what happens. The real pessimists are your Bascoms and that kind, and I guess I pity him more than blame him. He seems as lonesome as a toothpick in a cider barrel."

"But I thought that Bascom was a wealthy man. He ought to be able to help out and raise money enough so that the town could keep a parson and his wife comfortably."

"Sure thing! But the church isn't supported by tight-fisted wealthy people. It's the hard-workin' middle class who are willin' to turn in and spend their last cent for the church. And don't you get me started on Bascom if you value your life. Maybe I'll swear a blue streak before I get through. Not but what I suppose that even Bascom has his good points—like a porcupine. But a little emery paper on Bascom's good points wouldn't hurt 'em very much. They're awful rusty."

"Oh well! Money isn't all there is in life," soothed Maxwell, smiling.

"No, not quite, but it's a mighty good thing to have in the house. You'd think so if you had to wear the same hat three summers. I've got to that time in my life where I can get along very well without most of the necessities, but I must have a few luxuries to keep me goin'."

"Then you think that a clergyman ought not to marry and bring his wife to a place like Durford?"

"I didn't say anything of the sort. If you was to get married I'd see you through, if it broke my neck or Bascom's."

"Do you know, you seem to me a bit illogical?" remarked Maxwell mildly.

"Don't talk to me about logic! The strongest argument is often the biggest lie. There are times in your life when you have to take your fate in both hands and shut your eyes, and jump in the dark. Maybe you'll land on your feet and maybe you—won't. But you have got to jump just the same. That's matrimony—common sense, idiocy, or whatever you choose to call it. I never could tell which. It's the only thing to do; and any man with a backbone and a fist won't hesitate very long. If you marry I'll see you through, though, of course, you won't stay here long, anyhow."

"You're awfully kind, Mrs. Burke," Maxwell replied, "and I sha'n't forget your promise—when the time comes for me to take the momentous step. But I think it would be the wisest thing for me to keep my heart free for a while, or at any rate, not to get married."

Mrs. Burke looked down at her rector and smiled broadly at his clever evasion of the bait she had dangled before him so persistently.

"Well, do as you like, but that reminds me that when next you go to town you'll need to get a new glass for that miniature of your sister. You must have dozed off with it in your hands last night and dropped it. I found it this morning on the floor alongside of your chair with the glass broken."

She rose triumphantly, as she knitted the last stitch of the wash rag. "Excuse me—I must go and peel the potatoes for dinner."

"I'd offer to contribute to the menu, by catching some fish for you, but I don't think it's a very good day for fishing, is it, Mrs. Burke?" asked Maxwell innocently

(To be continued.)

Come to Detroit
The Automobile Center
And
LEARN THE AUTOMOBILE BUSINESS

Big opportunities everywhere for Detroit trained automobile men. Interesting, pleasant and money making business. Ambitious men needed to start garage and repair shops everywhere. Learn how. Chauffers, garage and repair men, testers, etc., have more than they can do. *Plenty of room for you.*

EARN $75 TO $300 A MONTH

Students have experience of building new cars from start to finish—factory training in block testing, etc.—all the leading types of starting, lighting and ignition systems in operation. New 6-cyl. Losier Touring Car and 8-cyl. King Car used for road instruction. Just purchased—new 8-cylinder Motor for block test dept. solely for students instruction. Just added 1916 Delco System as used in Buick, Hudson and Packard 12.

DETROIT IS THE PLACE TO LEARN

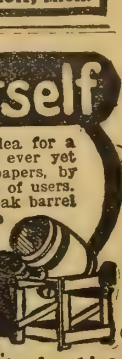
44 Automobile Factories. They all know and endorse our school. Students can go through them, including Detroit Electric Service Department, without extra charge. Remember, ours is the Old Reliable School, in the heart of the Automobile Industry. Start course anytime. Write for full particulars, guarantee and copy of "Auto School News" and new pictorial catalog—just out—ALL FREE. Or better still, jump on a train and come to Detroit, as hundreds have done.

Learn the automobile business in Detroit and learn it right.

MICHIGAN STATE AUTO SCHOOL, 14020 Auto Bldg., 11-19 Selden Ave., DETROIT, MICH.

Build It Yourself

Here is the first real, practical idea for a perfect home-made concrete mixer ever yet produced. Endorsed by all farm papers, by concrete engineers and by hundreds of users. You make it with a few 2x6's, an oak barrel and a few castings. Send your name and get full instructions and



Blue Print PLANS FREE

It will mix 2½ cu. ft. at a batch, has self-tilting dump, runs by hand or 1 h. p. engine. Will keep from 2 to 6 men busy. Does finest work, equal to any $200 machine—and costs you almost nothing in comparison. Just drop me your name on a post-card today. Full instructions and blue print plans will come at once. FREE.

SHELDON MANUFACTURING CO., Box 4493 Sheboygan, Wis.

Mix Your Own Concrete

A Successful Alfalfa Grinder

The Letz outfit (Grinder and Alfalfa Cutter attachment) grinds 400 to 600 lbs. alfalfa meal per hour with a 4 h. p. engine. Also grinds clover hay, all kinds grain, snap corn (corn, cob, husks) kaffir corn in the head, etc. Grinds oat hulls or screenings to flour. Silent running, self-aligning, self-sharpening—uses 25% less gas. Pays for self by saving in cost of grinding plates.

LETZ FEED MILL Self-Sharpening Silent-Duty

World's Best Feed Grinders

Ten Days Trial. Money back if not satisfactory.

THE HOME

Letters intended for publication should be accompanied by the name and address of the writer, not necessarily for publication, but as a matter of good faith. All communications intended for this department should be addressed to Editor Home Dept., Wisconsin Farmer, Madison, Wis.

WOMEN SHOULD MAKE WILL.

It is considered the proper and usual thing for a man to make a will, but not often does a woman even think of such a thing. It is just as important for the mother to provide for the children she may have to leave as for the father to do so.

For instance, if you have property or money in your own name, a will makes your wishes in regard to it binding and every penny, without delay or cost, will go to those you intend shall have it.

If you are a widow failure to make a will involves not only a loss of time in getting the estate settled up as well as unnecessary expenditure of money which may be needed for the children you want to provide for, but it means also that you will have nothing to say about who shall look after your children.

If you have minor children and have not indicated in a will who shall be their guardian the court will appoint one and it might not be the person you think would do the best by them. Moreover, the guardian appointed by the court may charge commissions, counsel fees and premiums, all of which will come out of the children's share of the estate, be it large or small, and many a time commissions and fees eat up all of a small legacy and the little ones are left in want.

That is putting the matter in a different light isn't it? It doesn't make much difference who looks after your property so far as the property goes, but when the conduct of such affairs so vitally affects the welfare of your little ones it is quite a different matter.

If you should leave real estate and no will it could not be sold without the appointment of an administrator and an order of the court, and that would mean a long and expensive proceeding. If there are minor children their share cannot be sold until they are of age, no matter how badly they may need it. All this costs money and yet all these requirements must be complied with in order that good title may be given to the real estate. In no case can a clear title to the property be given for at least two years after your death.

The failure to make a will means a lot of worry and expense and trouble for the children, which is the very thing you want to save them from and every woman who has the welfare of her children at heart should see to it that all these things are provided for in a will so that that which she wishes to leave to her children is not eaten up in court fees and that the proper person is selected to look after them until they are of age.

PROGRESS OF BABY WEEK CAMPAIGN.

There are 1,727 communities considering some preparation for Baby Week, according to the inquiries received by the children's bureau of the United States Department of Labor. This number does not include those of whose interest in the campaign word has come to the bureau directly.

The letters about Baby Week are still coming in from every state in the Union and from every type of community, such as a Colorado settlement forty miles from a railroad, a club of women on one of the government reclamation projects, a Montana coal mining town with a large foreign population, a southern mill village and a club of farm women in a middle western state.

Texas has its own Baby Week slogan—Baby Health is Texas Wealth—and Mississippi has started a competition to secure a slogan for that state. North Dakota reports plans for a statewide essay contest in the public schools. In a few state campaigns the state federation of women's clubs, the state university extension department, the state health officials and those who are especially interested in education are all co-operating in the Baby Week campaign.

In its suggestions for Baby Week observance the children's bureau lays special emphasis on the opportunity it affords for extending permanent work for infant welfare, such as infant welfare stations, visiting nursing, special nursing and instruction for prospective mothers, city inspection of milk, special work for the prevention of blindness and little mothers' classes and home nursing instruction for school girls in the upper grades.

GIVES SOME GOOD ADVICE.

To the Editor:—I have long been an interested reader of this department, but have never written before. When I saw the inquiry from "Constant Reader" I felt I should write now.

She wanted to know why one who is a good, moral person is not a Christian. Let me tell her to read the New Testament as a child would read, believing, and she will soon see the necessity of belonging to the church Christ established. Read Mark 16:16. To be Christians we must be like Christ and he was baptized.

There are many scriptures to prove the necessity as well as the pleasure of being a Christian, but one-half Christian is no better than a sinner. Read the Bible and then do just what it says, regardless of creeds. The Bible is the true creed. Then find the church that endeavors to live up to the whole gospel and you will find peace to your soul, both here and hereafter.

I think the prayers for children that you have been printing are very good. "Train a child in the way he should go and when he is old he will not depart from it." I have three bright little children, the oldest not quite five, and none of them have had any sickness to speak of. I believe in giving children fresh air and sunlight. How they do enjoy the sunlight when they have been kept in a few days!. I believe coddling makes sickly babies. Take them out and make "hardy plants" of them.

One thing I want to speak of, I don't think parents should tease their children and tell them things that are not so, even if it is only in fun, for the child does not see the difference between "only joking" and lying, and so we might unconsciously teach them to tell untruths.

I should like to hear from mothers who are able to train their children as they should be. I find it a hard problem. Mrs. M. A. Whisler.

LETTERS FROM OTHERS HAVE HELPED HER.

To the Editor:—I have been noticing pictures of fresh-air babies in the Home Department, so I am sending you a picture of our baby. His name is Donald Lee, age six months, weight forty-eight and one-half pounds. He is a happy, healthy boy and I think his fresh air rides have made a part of his happiness. He is our only child.

I have been a reader of your paper for a long time, but never have written before. Your articles have sure been a help to me. I took the advice

SIX-MONTHS-OLD DONALD LEE QUIVEY.

of what some of the mothers had to say in your paper before I was a mother and since, too, and I have never been sorry that I did.

Mrs. L. J. Quivey.

Lorena, Guy, Gladys and W. M. Bridges, children of Mr. and Mrs. Geo. C. Bridges. The oldest girl is eight, the next younger girl and the boy are twins, age four, and the baby is five months. Mrs. Bridges says they are all healthy and happy and she is justly proud of her family.

CHRIST ESTABLISHED BUT ONE CHURCH.

To the Editor:—In the Home Department of the February 3d issue "Constant Reader" asks a question or two, to which I wish to make answer in part, concerning denominational creeds and how they may affect one in the Christian life.

I want to say, first, that the various creeds, of which there are hundreds, do not cut any figure whatever under the New Testament covenant in the salvation of the soul.

"Constant Reader" asks: "Why is one a Christian and more likely to be saved after uniting with a church than when living an honest, conscientious life out of the church?"

Notice how this question is worded, viz., "a church" would signify more than one, while "the church" would signify a particular one, or only one. Christ established but one church, one Lord, one faith.

Let me say to "Constant Reader" you cannot be a Christian out of the church and the only way to get into that church is through Christ, the Door. Jesus told Nicodemus that he must be born again, born of the spirit. "Marvel not," he says, "ye must be born again," which birth puts one into the church. Jesus said, "I am at the door, if any man enters in by me he shall be saved, and he that climbeth up any other way the same is a thief and a robber." That "any other way" would be joining a church with man and man-made creeds as the door. The Bible does not authorize anything of the kind.

As a rule, one creed has just as good a foundation to build on as another, but just think, Constant Reader, what a conglomerated mess it would be to undertake to blend them all and try to live a conscientious Christian life thereby. Subscriber.

THE BIBLE IS THE CHRISTIAN'S CREED.

To the Editor:—I have been a subscriber of your paper for years and have read the Home Department with much help and interest.

I would like to say to "Constant Reader" who wants to know the difference in creeds, why have any creed but God's Word or the Bible? I am a member of the Christian church, and,

while we do not claim to be the only Christians, we claim to be Christians only and our creed is the Bible. I find no mention of the necessity of a creed more than the Bible. It should be our guide and it teaches us that we should repent and be buried in baptism, also not to neglect the "assembling of ourselves together "(in His house, as I understand it.)

We are required to do these things because Christ commands us to do these things and we must obey God and keep his commandments. I think we all should read and study the Word of God and follow its exact teachings, for it says in Revelations, the last chapter and almost the last verse:

For I testify unto every man that heareth the words of the prophecy of this book, if any man shall add unto these things God shall add unto him the plagues that are written in this book.
And if any man shall take away from the words of the book of this prophecy, God shall take away his part out of the book of life and out of the holy city and from the things which are written in this book.

A Christian Only.

EATS AND SLEEPS REGULARLY.

To the Editor:—As I have seen so many mothers sending pictures of their babies I thought I would send mine. This picture was taken when she was thirteen months old. Her name is Nellie Elizabeth and she is

NELLIE ELIZABETH JEPPESEN.

now two years and nine months old. She has never been sick except having a slight cold in her nose, which only lasted a few days.

At birth she weighed seven and a half pounds, at three months twelve and a half pounds, at five months seventeen pounds and at nine months twenty-one pounds.

The first year and a half she had a bath twice a day and now she has one each week. I nursed her until she was about a year old. I am very careful with her food. She sleeps and eats regularly. I never take her out in damp or stormy weather.

Mrs. J. Jeppesen.

WANTS MORE INFORMATION ABOUT SAUSAGE.

To the Editor:—I saw Mrs. H. A. M.'s suggestion for packing sausage and I wish she would tell us how she makes her sausage.

As I believe one good turn deserves another I will send a recipe for making green tomato mince meat. It may be a help to someone when canning season comes again. I think it is fine.

Chop fine one peck of green tomatoes, drain off the juice, measure, put in as much water as there was juice and add five pounds of brown sugar and three pounds of raisins. Boil slowly until the tomatoes are done. Add two tablespoonfuls each of allspice, cloves, cinnamon and salt and one cupful of vinegar. Cook until thick enough for pies. Then add fifteen sour apples chopped fine. Cook until the apples are done, then can.

Do not use the juice off the tomatoes. Mrs. L. M. G.

INTERESTED IN SAUSAGE.

To the Editor:—I am a reader of the Home Department and I have seen a suggestion for keeping sausage in jars. I wish the lady who sent in that letter would tell us if she fries the sausage before she puts it in the jar and if there would be any danger of poison if the jar should be cracked.

A Reader.

[Editor's Note.—We suggest that Mrs. H. A. M. or anyone else who has had good success keeping sausage in this way write a letter to the Home Department explaining the process in detail for the benefit of those who have not tried it heretofore.]

ENJOYS THE MOTHERS' LETTERS.

To the Editor:—I have been much interested in reading the mothers' letters. I am sending a picture of my boy, Harry Lee, taken at the age of ten months, when his weight was thirty pounds. He has always been healthy and had plenty of fresh air

HARRY LEE SLATTEN AT TEN MONTHS OF AGE.

and exercise, and now, at the age of three years, he weighs forty-five pounds and is strong and healthy—and mischievous, too. I send the picture because he has always been considered unusually large and strong for his age.

Let us have more photographs and "baby talk." Mrs. O. L. Slatten.

BREAD "STARTERS."

To the Editor:—Will some of the readers of the Home page send in recipes for "starters" for bread and give instructions for using? I have seen these recipes before, but I have mislaid them and I would like to know what other housewives use.

A Reader.

HOUSEHOLD SUGGESTIONS.

Up-to-date cooks add the baking powder to cake and batter mixtures after everything else has been added. The older method of sifting it in with the flour is easier, but the new method insures the full strength of the baking powder, for it begins to work as soon as it is moist.

When you have a little beefsteak left over chop it fine, mix it with cooked rice, season with butter, salt and pepper and a little onion. This makes a delicious filling for stuffed peppers. Cut off the small end of the pepper, clean out the seeds and fill. Bake until the peppers are soft.

White cotton crepe affords an excellent material for tea towels. After being washed to take out the stiffness it is absorbent, non-linty, and is sufficiently rough to give a high polish to glassware. Also, it is much more easily laundered than ordinary glass toweling.

A common 10-cent currycomb will be found convenient in cleaning the brush of a carpet sweeper of threads, hairs, etc.

When croquettes or other fried food is removed from the fat it should be thoroughly drained on paper. A roll of paper toweling is a conveniences for this purpose.

Try taking a nap in the afternoon if you are going to be out late in the evening.

Sweet oil rubbed on shoes when they are dry will soften the leather and will also remove a reddish or musty color from black shoes.

VEGETABLE PEACHES—GROW IN 80 DAYS.

Something new for your garden. A real wonder. Size of peaches, perfectly delicious. Nothing like them under the sun. Of easiest culture, succeed everywhere and produce enormous crops in 80 days. I send full directions. Large Packet and big 25c Flower Collection for your wife—for **one dime** to introduce. 3 Packets and 3 Flower Collections for 25 cents. Seed Catalog and Premium List with all orders. Name this paper. Address, A. D. COOK, Seedsman, Hyde Park, N. Y.—Adv.

RECIPES.

Pork Cake.—One pound of fat salt pork, one pint of boiling water, two cups of sugar, one cup of molasses, one teaspoonful of soda, one teaspoonful of cloves, two teaspoonfuls of cinnamon, one pound of currants, one pound of raisins, one-fourth pound of citron, flour. Wash and dry the currants. Wash, seed and chop the raisins. Shred the citron. Have the pork entirely free from lean and rind and chop very fine or put through the food chopper, using the finest cutter. Pour the boiling water over the chopped pork, add the sugar, mix the soda with the molasses and add the molasses. Mix the spices with part of the flour and stir into the mixture. Add the fruit and then the rest of the flour. No definite amount of flour is given, but the batter should be as thick as one can stir. It is well to try a sample cake, as one seldom uses enough flour the first time. Bake in a moderate oven from three to four hours, or steam three hours and bake one hour.

Corn Bread.—Three cupfuls corn meal, three-fourths cupful flour, one-fourth cupful sugar (light brown), three-fourths cupful sour cream, two cupfuls sour milk, one teaspoonful soda dissolved in a little milk, a little salt.—Mrs. H. H.

Cabbage With Cream Sauce.—One medium-sized cabbage, one cupful of cream sauce, one tablespoonful of dried celery top, one teaspoonful of salt. Cut the cabbage into quarters, cover with cold water for thirty minutes, drain, cover with boiling water, boil for forty-five minutes in an uncovered boiler, and drain again. Lay in a shallow dish, cut side up, dust with salt, cover with one tablespoonful of dried celery. The sauce may be flavored with nutmeg or onion.

Fruit Juice Pie.—One and one-half cups sweetened fruit juice, two and one-half level tablespoonfuls cornstarch, two eggs (whites for meringue), one teaspoonful butter, one-fourth cupful sugar, a pinch of salt. Heat the sweetened fruit juice, canned or fresh, grape, cherry or anything with a tart flavor. Then mix together the sugar, salt, cornstarch and beaten yolk. Add a little cold water. Stir this slowly into the boiling juice and cook seven minutes. Pour into baked crust, cover with merinque and brown.

Ginger Cookies.—One cupful of sugar, one heaping cupful of lard, one cupful of dark sirup, two eggs, three level teaspoonfuls of soda in three large spoonfuls of water, two tablespoonfuls of ginger. Mix very, very stiff and bake fast.—M. C.

Prune Cream.—Remove stones from stewed prunes and cut fruit in small pieces—there should be two-thirds of

a cupful. Soak one tablespoonful of gelatine in one-fourth cupful of cold water, and dissolve in one-fourth cupful of scalded milk; then add one-half cupful of sugar. Strain into a pan, set in larger pan containing ice water, and stir constantly until mixture begins to thicken, then add whites of two eggs, beaten until stiff, one-half pint heavy cream diluted with one-third cupful milk, beaten until stiff, and prunes. Turn into a mold, first dipped in cold water, and chill.

All letters from boys and girls to this department should be sent to office of The Wisconsin Farmer, Madison, Wisconsin.

LIVES ON AN UP-TO-DATE FARM.

Dear Young Folks:—May I join your circle? I have read the stories on the Young Folks' page and enjoy them very much.

I live on a farm near the Buffalo river. We have sixteen horses, twenty-two head of cattle and about 280 chickens. We keep the chickens in a concrete building. We also have a concrete silo, so that the cattle get silage all the year around. We have electric light in our house, furnished by water power.

Two of my sisters and I go to a consolidated school. My sisters are in the fourth year high school and I am in the eighth grade. I take domestic science and agriculture besides my other subjects. —From A Friend.

A GOOD RECORD AT SCHOOL.

Dear Young Folks:—This is my first letter and I hope you will enjoy reading it. I am a little girl seven years old. I live close to school and I have gone five months without missing a day. My teacher's name is Miss Lelah and I love her and my little schoolmates. Sister tells me to learn so I can go to high school like she does. Sister says she loves high school.

I am always so glad when sister comes home Friday evenings. We have such nice times reading and spelling. I don't get to see her very often now, for it has been too bad for grandpa to run his car.

I haven't any pets to tell you about, but I have four dolls. Their names are Rosey, Sadie, Dinah and Leon.

I will write a longer letter the next time. If grandma sees my letter on the Young Folks' page she won't be able to read any more without laughing. —Reitha.

FIDO HAS A SLEIGH RIDE, TOO.

Dear Young Folks:—I have been reading your letters these last few months and I am so interested in them. This is the first time I have ever written.

We live two miles from town and four rods from the schoolhouse. On the farm we have nineteen head of cattle and six head of horses besides eighteen hogs. I do a little work before and after school. I get wood in the house and milk two cows and then I have some fun with my dog, Fido.

I hitched Fido up to my sled and went sleighing. He is a good little puller and took me everywhere. After he pulled me a while I stopped him and put him on the sled and gave him a sleigh ride. He sat there just as nice and quiet as a child.

When I go to school poor Fido is so lonesome he will come to the schoolhouse door and sit there and wait for me to start home.

I like to go to school. I am in the fourth grade.

I have a rabbit trap that my brother fixed for me. I caught quite a few rabbits. In the morning the first thing I do is to take Fido and go out and look at my trap and if there is a rabbit in the trap I set the trap on my sled and haul it to the barn. Then I shut the doors and open the trap and let Fido catch the rabbit. I tell you that is some fun for my little Fido. He is a hunting dog and his color is brown and his ears are long. —Edward.

A BOY WORTH WHILE.

Dear Young Folks:—I enjoy reading the letters and stories in the Young Folks' page very much. I am thirteen years old and am in the seventh grade. My school is half a mile from home.

I live on a large farm ten miles from a little town. I live with my grandparents. I have no brothers nor sisters.

My grandpa owns five head of fine horses, three cows and calves and a large number of yearlings.

We have an organ and I can play a few pieces. I have a little bantam hen and rooster and also a pet cat. I can do some needlework and I can milk the cows and sweep and do most any kind of work, also cook.

I like to ride horseback and do often. —Jimmie.

OUR FASHION DEPARTMENT.

ALL PATTERNS, 10 Cents Each.

THIS department is prepared especially for The Wisconsin Farmer. We can supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10 cents each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering, all you have to do is to write your name and address plainly, tell us the correct number and size of each pattern you want and inclose 10 cents for each number. We agree to fill all orders promptly and guarantee safe delivery. Address all orders to The Wisconsin Farmer, Madison, Wis.

7606 Ladies' Waist.—Cut in sizes 36 to 44 inches bust measure. This pretty waist is very full in both front and back the fronts opening over a soft little vest. There is a high, flare collar at the back of the open neck and the sleeves are quite full from the shoulder to the wrist.

6464 Boys' Blouse.—Cut in sizes 4, 6, 8, 10 and 12 years. Percale, madras, flannel, serge and similar materials can be used to make this blouse. The blouse may be made with or without the back yoke facing and with permanent or removable collar.

7588 Ladies' Corset Cover.—Cut in sizes 34 to 42 inches bust measure. This dainty garment may be made of plain material or of embroidered flouncing as shown. It is made without shoulder seams and a single length of embroidery is used, crossing over in front and back in surplice style.

7620 Children's Rompers.—Cut in sizes 2, 4, 6 and 8 years. These rompers are to be worn without skirts under them. They have either a front or a back opening as preferred, but in either case there is an opening across the waistline in the back. The neck is high, with flat collar and the sleeves are long with band cuff.

7604 Girls' Dress.—Cut in sizes 4, 6, 8, 10 and 12 years. Blouse and skirt are joined to this dress. It has a side front closing, with either a high neck and standing collar, or round neck and flat collar. The sleeves are plain and either long or short with fancy cuff finish. The skirt has four gores.

7625 Ladies' Apron.—Cut in sizes small, medium and large. This natty apron is for use when engaged in light work only. It is often sufficient except on cleaning days. It has a bib in front with cross straps in the back and the skirt is in two parts, sloped up at the lower edges of the side seams.

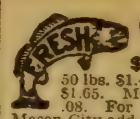
7624 Ladies' Skirt.—Cut in sizes 22 to 34 inches waist measure. This skirt has three gores, with closing in the center of the front. It fits neatly at the top and widens at the lower edge to 2⅜ yards in the medium size. At the top there is a fancy belt, with long side tabs, but this may be omitted.

7621 Misses' Dress.—Cut in sizes 14, 16, 18 and 20 years. Girlish and simple this dress has a plain blouse with center front closing. The neck is open with wide collar and the sleeves are either long or short. The skirt has a yoke of moderate depth and below this the three-gored lower portion is full and gathered.

7607 Ladies' Skirt.—Cut in sizes 22 to 34 inches waist measure. This design offers a novelty in a four-gore model. There is a seam down the center of both front and back and down the lower part of each side, but the upper part of each side is filled in with a sharply pointed gore.

7593 Ladies' Dress.—Cut in sizes 34 to 42 inches bust measure. Plain and practical this dress has a side front closing, with a high, flare collar at the sides and back of the plain, high neck. The long sleeves are fitted and finished without a cuff unless shortened. The skirt has a deep yoke below which are three gores.

Price of any of these patterns 10 cents each.



CHOICE LAKE HERRING

STRICTLY fresh weather frozen fish. Herring $3.00 per 100 lb. sack; $3.25 per 100 lb. box. Pike $9.25, Pickerel $6.25, Salted Herring 100 lb. keg $3.25, Salted Lake Trout $7.50 per 100 lb. keg. Star Fish Co., Box 167, Duluth, Minn. Ref.–Am. Ex. Nat'l. Bank. Discount on 500 lb. lots.

International Sunday School Lesson

Lesson for February 27, 1916
(By E. O. SELLERS, Acting Director of Sunday School Course.)

THE SEVEN HELPERS.

LESSON TEXT—Acts 6.

GOLDEN TEXT—Bear ye one another's burdens and so fulfill the law of Christ.—Gal, 6:2.

It would be a source of great blessing if every teacher and scholar would read through the book of Acts several times during the year. Such reading will give vision, inspiration and a more comprehensive idea of the continuation of what Jesus "began" and which record is not yet fully written. The time of this lesson is about A. D. 35, though Ramsey places it at 32, 33; and the place, the city of Jerusalem.

I. The Occasion, vv. 1-2. For a time the preaching of the Gospel of Jesus continued in Jerusalem, but soon the pressure of circumstances thrust it forth as prophesied (1:8). There were two groups of men in the early church: Those who had been born in Judea who spoke Hebrew (Aramaic), and those born in foreign cities and who spoke the Greek language. Trouble arose over the distribution of funds among certain of the dependent widows—the text suggests "secret displeasure." There was imperfection, selfishness, suspicion and jealousy in that early church.

II. The Method, vv. 3, 4. It does not appear that God gave the church a cut and dried program according to which it must act. Certainly the church had no precedent to follow, and step by step God was developing it. This lesson gives us a suggestion of those steps : (1) As the occasion demanded, (2) The Apostles refused to diminish their praying and preaching, literally it was not pleasing to God for the Apostles to "serve tables." such work must be done, certainly, but it was not to be done by these God-appointed and selected leaders, their duty was clearly stated. The minister's business is praying and ministering the word. These things should fully engage his attention, and in them he is "to continue steadfastly." The minister cannot manifestly "know more about books than the school-teacher; more about politics than the politician; more about medicine than the doctor; more about psychology than the college professor." No, that is out of the question, though he should be intelligent in these lines. But he should be preeminent in prayer and in the minis-

try of the word, and, furthermore, he should preach that word pre-eminently. (3) The church, not the apostles, must needs select these new officials. (4) The qualffications of these men, who were thus to care for these temporal affairs, were (a) "men of good report," not those bearing doubtful reputations, nor chosen because they were rich or shrewd in business. (b) "full of the spirit." It demands the Spirit-filled man to look after financial affairs as certainly as it does to teach or preach the word. (c) "full of wisdom." Men of common sense, a quality often sadly lacking among spiritually-minded men. Men meeting such qualifications will be men of "the spirit of power, of love and of a sound mind" (literally sound sense). (II Tim. 1:7).

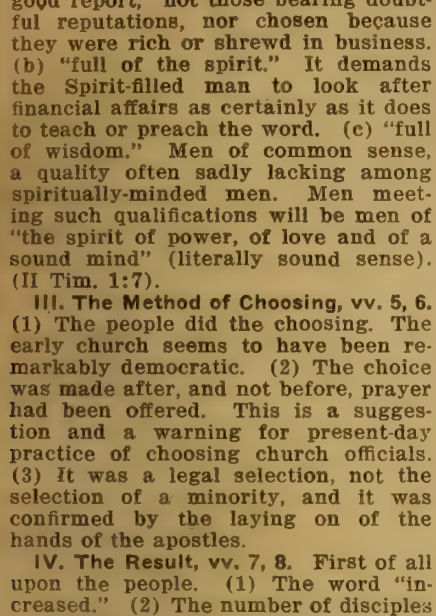
III. The Method of Choosing, vv. 5, 6. (1) The people did the choosing. The early church seems to have been remarkably democratic. (2) The choice was made after, and not before, prayer had been offered. This is a suggestion and a warning for present-day practice of choosing church officials. (3) It was a legal selection, not the selection of a minority, and it was confirmed by the laying on of the hands of the apostles.

IV. The Result, vv. 7, 8. First of all upon the people. (1) The word "increased." (2) The number of disciples "multiplied greatly," and (3) Some of the priests of the Jews were "obedient to the faith." Secondly, the result in the lives of the thus chosen and Spirit-anointed men gave evidence of the good hand of God. They were "full of grace" (Eph. 4:9, Acts 15:15); they were "full of power" (1:8). The first two of them soon became great and mighty preachers as well. Indeed as far as we can read they even outstripped the apostles themselves in real achievement for God. Stephen, of course, stands out pre-eminently. His character is suggested in verse eight. He was (a) "full of faith," (b) "full of the Holy Spirit," (c) "full of grace" (R. V.), (d) "full of power." How sad it is that so frequently our churches fail to make a wise and spirit-led choice of its leaders, and are content with few, or perhaps none, being added to its membership.

No man is fit to be an officer in the church of Christ unless he is filled with the Holy Spirit, (Acts 1:8, Luke 24:49).

Such a man will always stir up opposition of the powers of evil, even as did Stephen.

Those who opposed Stephen were moral and religious men (v. 9). Frequently the opposition a Spirit-filled man encounters is not from the immoral, the worldly, or the utterly ungodly; but those who stand out against him, and reason against him (v. 10), and often seek to kill him, are moral and religious men.



Health First

If a cow is well—if her organs of production are doing their duty—she will yield well. Time was when the cow that became sluggish and seemed to be going backward was promptly sold to the butcher.

Thousands of cow owners have found that in most cases proper treatment will save them the difference between the price of a beef cow and a vigorous milch cow.

Most dairy cow ailments are simple if the source of the trouble is reached. If the organs of production or reproduction are not doing their duty, try Kow-Kure—the medicine for run-down cows. It has worked wonders in many herds, and is especially recommended for the prevention and cure of Abortion, Barrenness, Milk Fever, Scouring, Lost Appetite, Bunches, Retained Afterbirth, etc.

Keep Kow-Kure on hand constantly. Sold in 50c. and $1.00 packages by feed dealers and druggists.

Write us for copy of our free book, "The Home Cow Doctor."

Dairy Association Co.

VETERINARY MATTERS

PROFESSIONAL Veterinary advice through this department to regular subscribers only. We do not answer veterinary inquiries for the benefit of "neighbors." Parties desiring information will be required to send their names in full with their address. No question will be answered by mail unless accompanied by a fee of one dollar. In order that correct information may be given, the symptoms should be accurately described, stating of how long standing, together with color and age of animal, and what treatment, if any, has been resorted to. All veterinary inquiries should be addressed to this office.

AILING ANIMALS.

Retention of Afterbirth.

I have a cow that lost her calf seven months before time and she did not clean. It is nearly four months since she lost her calf. What can I do for her?

It often happens that when cows abort early the afterbirth is retained. This should be removed at that time if possible. If left, it putrifies and usually comes away later piecemeal. You should not have let this cow go so long without treatment. If there is a discharge from her the vagina and uterus should be irrigated daily for a few days with a ½ per cent lysol solution or 1-3000 permanganas solution. It may be that you will need the services of a veterinarian to carry on this work and also to prescribe a suitable tonic.

Infected Stifle.

I had a three-year-old mare which I had shod in front, but three weeks ago when I had her hitched up to a load she slipped with one of her hind feet toward the inside and fell down, hurting her stifle. At first she did not dare to rest on her foot nor hardly put any weight on it in walking. It is a little better now. Her stifle seems to be in place, but it pains her. Could it be that her stifle is broken? If so, is there a remedy?

It is possible your animal has suffered a severe strain of tendons and ligaments in the region of the stifle. You should have had a competent veterinarian attend this animal when it was first injured. Give the animal complete rest for a few days and in the meantime bathe affected parts several times with alterations of hot and cold water. Later massage the parts with the hand, at same time applying chloroform or turpentine liniment, and give the animal some gentle exercise.

Excessive Perspiration in Cow.

I wish you would tell me what makes my cow sweat. She is a large cow of heavy milking power and is kept in a well-ventilated barn, with a ration of corn silage, bran and clover hay.

This condition of a cow sweating noticeably is of very uncommon occurrence. It would be very hard to say just what is the cause of this trouble without a thorough examination of the animal. It is possible that the other eliminative organs are overtaxed from some cause, and, therefore, cause the sweat glands to work excessively. Would advise that you give this cow plenty of exercise daily and also give about one ounce of potassium nitrate dissolved in her drinking water. If she does not improve in a week you should have a competent veterinarian make a thorough examination of the cow and her feed, etc., and he may be able to find the cause of the trouble.

Intestinal Worms.

I would like to have a good remedy for a four-year-old bay mare that seems to be wormy. Was in good shape and smooth last spring. In August, while driving her she passed a big bunch of worms about six inches long. Now her hair looks rough and her actions are slower. I tried smoking tobacco but haven't seen her pass any worms.

Your mare is probably infested with intestinal worms. For treatment give twice daily for three or four days a drench composed of oil of turpentine or creolin, one ounce, and linseed oil, two or three ounces, to be followed on the fourth day by a physic of Barbadoes aloes, one ounce in water used as drench. This last dose should not be repeated and should be followed in six or eight hours by one-half to one quart of raw linseed oil. After above treatment the use of tonics should be instituted. Try the following. Powdered nux vomica, two ounces; powdered ginger, two ounces; powdered gentian, two ounces; powdered Fenugreek, two ounces. Mix and divide into sixteen powders, one to be given with each feed. In drenching a horse a large metal syringe is best. Place fluid far back and toward roof of mouth.

Injury to Ligaments, Tendons or Their Sheaths.

I have a big Percheron stallion coming two years old that got hurt in his gamble joint. It seems to be on the inside and on the cords and it is swollen quite badly. He is not lame. I painted it with tincture of iodine, but it seemed to make it swell more. What can I put on it to reduce the swelling?

In regard to this stallion would say that the case by now is past the acute stage and is of a chronic nature. The treatment should be directed toward hastening the absorption of inflammatory exudate. Try the use of blue ointment and green soap, equal parts, with double the amount of vaseline. Massage parts well with this every day. These thickenings are sometimes very troublesome to remove and sometimes even impossible to remove.

Dental Fistula.

I have a six-year-old mule that got hurt about two years ago on a nail or something in the stable. The wound was in the jaw. When I first noticed it there was a small hole there and a little blood. I did not pay much attention to it, because I thought it would not amount to much, but after a year I had a veterinarian look at it. He split the place open and there was a hole in the jaw bone and he rasped around in the bone and washed it out and gave me some oil to put in it. But it did not do any good. The jaw bone at that place is a little thicker than on the other side and the hide is tight to the bone around the small hole. There is thick matter that comes out all the time and sticks to the hair and at times it smells some. It has been over two years since it was hurt. Please tell me what to do for it.

From your description we would be lead to believe that your mule is troubled with a dental fistula instead of some trouble caused by a nail. The trouble has probably come from some diseased condition of one or more of the teeth. Would advise you to have the teeth examined thoroughly and have the cause removed. This is your only possible show to get results.

Urinary Trouble.

I have a thirteen-year-old bay horse which has trouble with his water. He seems to try to pass water at times and can't. Sometimes only a little, then at other times quite a good deal. He seems to be in good spirits, works well, but does not gain in flesh as he should. He had an attack of the same last winter but seemed much better during the summer. What can be done for him?

There are so many causes of urinary disorders that it would be next to impossible to state just what the trouble is in the case you mention without a thorough examination of the animal. This can best be done by a competent veterinarian. It is possible that more than one examination may be necessary.

?

Ask Yourself—

What have I lost through Abortion

—in calves?
—in milk?
—in injury to cows and heifers?

Is it not time for me to clean up my herd, when I can give the treatment myself at small cost?

Cow Abortion Driven Out

Here's the evidence of men in the livestock business. It covers nearly twenty years. You can do what they did if you do as I tell you to do.—*Roberts.*

What is lost on one good calf would pay for the treatment of an average herd.

1898 "My herd of twenty-two cows was afflicted with Infectious Abortion in 1898. After losing a number of calves I began treating them with DR. ROBERTS' ANTI-ABORTION TREATMENT. I feel that they were permanently cured, for I have not lost any calves since that time, five years ago."—(J. A. Griswold, Duplainville, Wis.) "My herd of cows, eleven in number, was troubled with Infectious Abortion. I tried various remedies, without any relief; then I began treating my herd with ROBERTS' ANTI-ABORTION. I had ten live, strong, healthy calves come that year and have not lost a calf since that time—over three years ago."—(Sworn statement of Herman Shirley, deceased, Waukesha, Wis.)

1902 "My herd of twenty-two cows being afflicted with Abortion in 1902, I decided to try DR. ROBERTS' ANTI-ABORTION TREATMENT, which I did with results satisfactory, and I believe if used according to directions is a sure cure every time."—(I. Vandeburg, Kingston, Ill.)

1913-14-15 "In 1913 I applied your ANTI-ABORTION TREATMENT to my herd of forty-two head, and hereby wish to state that I cured my herd entirely and that I haven't had a single case of abortion since that time."—(Jos. F. Jira, Cary Sta., Ill.) "Several years ago we had Contagious Abortion in our herd and with your treatment completely eradicated it."—(Connecticut. Name on request.) "I am well pleased with your TREATMENT FOR ABORTION. I have nine fine calves and one cow left to calve yet. Two of the calves are from cows that aborted last year. I finished your treatment July 15, 1915, two months ago, and have seen no signs of disease since then."—(Iowa. Name on request.)

If your herd is afflicted with Contagious Abortion, and is free from tuberculosis, you can, with the Dr. Roberts treatment, clean up your herd and wipe out abortion. All Abortion Treatments are shipped direct from our laboratories at Waukesha.

A LAMP WITHOUT A WICK

The Sunshine Safety Lamp Co., 827 Factory Bldg., Kansas City, Mo., has a new portable gasoline lamp which gives the most powerful home light in the world—a blessing to every home not equipped with gas or electricity. 300 Candle Power at one cent per night. This remarkable lamp has no wick and no chimney, is absolutely safe and gives such universal satisfaction they are sending it on Free Trial. They want one person in each locality to whom they can refer new customers. Take advantage of their free trial offer. Agents wanted. Write them today.—Adv.

MAKING ROOM FOR MORE CROPS.

(Continued from page 17.)

clearing stump land—all more or less successful and popular. It is possible to grub stumps out and to burn them out—those are the old-fashioned, slow and laborious methods which many people think of first when considering clearing. The stumps can be blown out—usually with dynamite, too—or pulled out by a tractor or with a good stump puller. A well-made stump puller is said to combine in operation the good features of all the other methods, without exhibiting any features urged as disadvantages against some other methods.

It is possible to entirely clear land with a good, modern stump puller—to put it into shape for cultivation immediately the stumps and roots are removed or burned. It is a practical means of getting all the stumps and big roots out at one operation.

With a good stump puller—one of the modern steel machines—all the stumps can be pulled out. These pullers are enormously strong and by an arrangement of pulleys will double, triple and even quadruple the power of the direct pull. Generally speaking, no stump is big enough and tough enough to resist them.

The expense of clearing with a modern, perfected stump puller is not a fixed item, but the fact has been established on the experience of thousands that it is a very cheap method of clearing. Pulling stumps with a puller gets them out of the ground at minimum expense. The actual cost of clearing in any section depends, of course, on local conditions and is never the same in two localities. The number of stumps per acr , kind of stumps, kind of soil and condition the soil is in and various minor considerations all have to do with clearing cost.

This much is true—given good, fertile soil, the cost of clearing it cannot be anywhere near half the added value the clearing gives it. Here in Wisconsin and the neighboring states there are great areas of land which can be actually increased in value from $50 to $75 an acre with a stump puller.

The stump puller method of clearing is a safe one. The perfected modern machines for pulling stumps are so safeguarded as to be practically accident proof and are no more dangerous to use than a farm wagon. They are under control all the time.

It may seem strange to the reader that the writer urges the consideration of a good stump puller for clearing as a matter of economy. It has been proven many times that the modern stump puller will actually get stumps out at the very lowest possible expense.

The largest stump pullers now on the market require for successful operation under the hardest condition only four men and three horses and the average outfit only three men and two horses. Aside from the labor of the men and teams the only expense for operating the stump puller is the small item of a little axle grease on the machine.

The speed at which a good, dependable stump puller can be operated depends on the size and kind of stumps and the condition of the ground. In this and adjoining states the average day's work seems to vary from 100 to 300 stumps. Frequently 400 to 500 are pulled in a day and seldom, if ever, as few as fifty. Now, if you stump land owners have any idea as to the number of stumps to the acre on your land you can compute roughly the time required to do your clearing.

One advantage a good stump puller possesses is worthy of special mention here. It practically puts the lands in condition for cultivation at once. It gets out the big roots near the surface that interfere with the plow and saves a lot of extra work that way. That's one of the reasons why pulling stumps is less expensive—it leaves less work to be done after the stumps are out. Any farmer who has attempted to plow in a field where a lot of big roots lie just under the ground will appreciate the advantage of a clearing method that gets stumps out, root and all.

The accompanying illustrations show clearing scenes and will serve to give those unused to such work an idea of its nature. All these views show clearing done by means of stump pullers.

THE STUMP PULLER "FIRST-AID" TO THE SETTLER.

The first two views shown herewith show how big roots are pulled out with the stumps. One was taken near Weirgor, Wisconsin, and the other on a farm owned by Drs. Enger and Homrick near Ladysmith, Wisconsin.

Now, the big thing and the important thing, of course, is the clearing itself, rather than the methods. It is important to the country at large, the state and every individual community that the stump land be cleared and put to crop producing.

The sooner this land is cleared of stumps and given a chance to grow crops the better. There is no danger of overproduction in this country and there will not be. We need this land for crops today and we will need it more and more every succeeding year.

The states which have large areas of cut-over land cannot hope to take their proper economic position in the Union until this stump land is cleared and producing crops. Therefore, it is incumbent upon us here in Wisconsin to "boost" for land clearing, regardless of the methods used, if we are interested in the future of our state and feel some pride in seeing her take the place among the great food-producing states that should be hers by reason of natural advantages.

We have spoken here particularly of land clearing as applied to raw land. What we have said applies equally well to the land that is partly cleared and is being cropped with insufficient cultivation because dotted with standing stumps which interfere with the proper operation of farm machinery those stumps are a losing proposition to the farmer—hinder production every season. They should be gotten rid of by the best available means, be what it may.

Clear your land, neighbor. Get rid of the stumps. Dig them out, burn them out, blow them out or pull them out—any way you prefer—but get rid of them. It's the first step in developing your own farm, your community, your state and your nation.

Fifty counties are now organized under the Wisconsin Agricultural Experiment Station and the other counties should fall in line until there is not a single one missing from the list.

Although the dairy business is increasing throughout the country, there is at present no sign of overproduction. The consumption of dairy products is increasing very rapidly and people are learning to make much greater use of these products than in former years.

A PREMO CAMERA

Is a Necessity--Not a Luxury

This camera is made by the Eastman Kodak Co., is of the box type, with universal focus lens, the simplest instrument for picture-making that can be devised. It will produce excellent results in the hands of anyone; no experience necessary. Film pack used, daylight loading. Pictures 2 1-4 x 3 1-4. Booklet of instructions included with each camera.

HAVE YOU ALWAYS REGARDED A CAMERA AS MERELY A "PLAY-THING?"

What do you raise?

Fruits? Livestock? Grain? Flowers?

It doesn't matter--whatever it is, you raise it to sell, don't you? Now, how much better than "telling" distant prospective customers what you have, is ***showing*** them! You can't bring them to your farm, but pictures will get practically the same result. One picture tells more than pages of words.

What better way of keeping a record of growth, than by pictures?

A Picture of old Dobbin with Baby on his back, will be priceless twenty years from now.

HERE'S HOW YOU CAN GET A CAMERA--

Given with The Housewife for one year at $1.80. Cameras sent postpaid, delivery guaranteed.

Remit by P. O. Money Order or Registered Letter. Address

The HOUSEWIFE, 30 Irving Place, New York City

Live Stock Items and Commercial Notes

Gathered by Representatives of The Wisconsin Farmer

Plymouth Holstein Sale.

THE third annual sale of high-grade and registered Holstein cattle held by Plymouth breeders, will be the largest ever held. The sale this year extends over three days, viz.: on Wednesday, March 8th, F. W. Traxler sells ten head of registered heifers, one registered six months old bull and thirty-four high grades; Thursday, March 9th, the Plymouth Canning Co., sell thirty-eight high grades; Friday, March 10th, George Buelke sells sixteen choice high-grade Holsteins, the registered bull, Electa De Kol Burke and a number of registered heifer calves. The offering of F. W. Traxler is especially attractive. The registered heifers are choice individuals backed by heavy producing ancestry. They are well grown, of good type and well bred. The high grades are for all useful purposes, the equal of pure breds. They are well marked, have big udders and are of good type. They were selected from some of the best herds in the country and are not culls in any sense of the word. The canning companies' consignment is also one of merit and the majority of the animals cannot be told from pure breds either in markings, type or production ability. Mr. George Buelke is dispersing his entire herd of high grades, as he now has a full herd of registered cattle. Here will be an opportunity to get the best grades in his herd. On Wednesday, March 9th, the Plymouth Brewing Company will sell four span of heavy horses and one span of mules. The horses are match teams five and six years old and gray and black in color. Terms of the sale are six to eight months' time on approved notes at 6 per cent. See page 39.—Adv.

A Two-Year-Old Percheron Bargain.

WHEN a farmer has only one or two registered mares that he maintains for breeding purposes and farm work, a prospective buyer can generally find their colts well grown and cared for and the dealers are glad to buy such colts. Archie H. Cook, Baraboo, Wis., has one registered mare that has proven valuable to him as a breeding matron and her two-year-old stallion colt is now being offered for sale. He is a seal brown, a very rich color, a colt with exceptional quality, and bone that horsemen like. He has good lines, a fine crest and is one that should make a valuable sire at maturity. He is just turned two and will weigh right at 1,700 pounds. His sire, imported Gibus, is a grandson of old Brilliant and his dam is by a son of Theudis he by Brilliant. His second, third and fourth dams are all Brilliant bred mares. This colt will suit any dealer, for he can go into any sale barn without any special fitting. Some farmer that wants a horse for the coming season can well afford to get in touch with the owner of this good colt. We would suggest that you write for the price at once, for he is a bargain and will be picked up soon. Don't forget to mention The Wisconsin Farmer, when writing. See page 38.—Adv.

155-Egg Incubator Only $7.85.

NO poultry raiser can afford to be without the advantages of an incubator when they can get a Progressive with 155-egg capacity for only $7.85. They are splendidly built of the best materials and have all the latest improvements. The eggs are protected against sudden changes by hundreds of dead air cells and 100 per cent hatches are said to be no unusual thing for them. The Progressive incubator and brooder sell for $9.85 and freight is prepaid east of the Rockies. If you are not satisfied with them your money will be returned with 8 per cent interest. In their advertisement on page 27 the makers are offering to send you free their big poultry book, together with their special new combination offer. All that you need to do is to drop them a line, addressing Progressive Incubator Co., Box 128, Racine, Wis., and mention their advertisement in this paper.—Adv.

A Cheap Farm Hand.

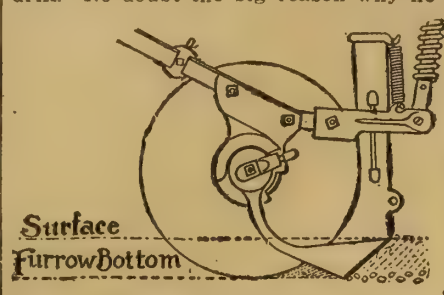
ATLAS farm powder is made especially for farm use in blasting out stumps, shattering boulders, breaking up hard pan, digging ditches, post holes, etc. For that reason "safety first" has been considered in its manufacture, so that the makers claim that it is the safest explosive known. It can be used without any danger by any ordinarily intelligent man and will prove one of the cheapest and most effective helps to better farming that any farmer can secure. It is called "the cheapest farm hand." In their advertisement on page 25 the Atlas Powder Co. offers to send free to anyone filling out the attached coupon their valuable seventy-four-page booklet, "Better Farming." In writing for it address Atlas Powder Co., Wilmington, Del., and kindly mention The Wisconsin Farmer.—Adv.

"Famous Collection" Seed Offer.

IN the Great Northern Seed Co.,'s advertisement on page 25, is described their special dollar offer, comprising one of their famous collections which will be mailed to you postpaid on receipt of order. For 10 cents' additional postage they will mail you their new instructive Garden Guide, containing good advice for every gardener and planter. In writing address Great Northern Seed Co., 307 Rose St., Rockford, Ill.—Adv.

Grain Drill Increased This Crop.

ONE day season before last a farmer named Rummens, living near Pomeroy, Wash., had his team run away with his grain drill while he was working along the railroad right of way. The team tore across the tracks, hopelessly smashing the drill. As it was impossible for him to get the necessary repair parts without sending to Portland he discarded the broken drill and got himself a New Peoria Disk Shoe Drill from a Pomeroy dealer and took it out and started in to work again where he had left off with the other drill. No doubt the big reason why he



chose the Peoria was because of the famous disk shoe, here illustrated: This is a combination disk and shoe that has all the merits of the single disk for cutting the trash and hard ground and opening the furrow plus the power of the shoe for forming the furrow and depositing the grain. The forward end of shoe being pivoted to disk bearing, works independently of the disk. The disk opens the furrow, Then, the shoe follows directly behind and deposits the seed on a packed seed bottom. This insures for the seed the three essential requirements to make small grain grow: Heat, air and moisture. The shoe always travels the same depth as the disk. No loose dirt can fall into the furrow until after the seed is deposited. No seed can ever come in contact with disk. The merits of this unique device were certainly appreciated by Mr. Rummens, for, in a letter, he says: "I was perfectly astonished at the results. When the grain was grown, the point where I had begun with the Peoria could be easily marked with the eye. The grain sowed by the Peoria was about four inches higher and at least 15 to 20 per cent thicker. The Peoria did perfect work and to say that I was highly pleased with the results is stating it mildly." Those wishing further details in regard to this remarkable drill can obtain same by writing to the Peoria Drill and Seeder Co., Peoria, Ill., who will be glad to send catalog to all who wish one.—Adv.

A SON of the thirty-one-pound bull, King Pontiac Champion, heads the herd of Wm. Fenner, Sheboygan Falls, Wis. See advertisement on page 39.

Edgewater Percherons.

THE Edgewater Stock Farms, Ft. Atkinson, Wis., are advertising twenty pure-bred Percherons for sale on page 38. The offering consists of mares, fillies and stud colts of various ages. The foundation stock were selected from some of the best Percheron breeding establishments in Wisconsin and the present offering is one of much credit. The mares are big, broody, drafty workers that will prove a profitable investment for farmers and breeders. The younger animals are a promising lot that were sired by Mattice, a stallion weighing over 2,050 pounds. The mares weigh from 1,600 to 1,800 pounds and are of dapple gray and black color. For breeding and further information in regard to these animals write to the above address.—Adv.

"Game Farming for Pleasure and Profit."

IT IS seldom that pleasure and profit can be combined on the farm to such a degree as that afforded in the breeding of game birds. It is profitable because the demand for eggs and breeding stock is far greater than the supply, with consequent high prices. For example pheasant eggs sell for from $20 to $25 a hundred and live birds bring from $5 to $7 a pair. They can be raised with very little trouble and expense, as can wild turkeys, quail, grouse and other birds. Game farming can be done as a side issue and the profits from it are just that much clear gain for the farmer or his wife. At the same time he is supplying game for the market he can have all that he needs for his own table. The Hercules Powder Co. is performing a public service in calling attention to the opportunities along this line in their very interesting advertisement on page 15, and in offering to send their interesting and instructive booklet, "Game Farming for Pleasure and Profit," to anyone filling out and mailing the attached coupon. We advise all our readers to send for a copy of this book. In doing so address Hercules Powder Co., Game Breeding Dept., Room 195, Wilmington, Del., and kindly mention The Wisconsin Farmer.—Adv.

A Logical Clean-Cut Proposition.

ON page 2 is an advertisement worth the attention of every reader of this paper. It graphically portrays the tremendous advantages of tractor farming, showing how one man and an Eagle tractor can do the work of three men and nine horses in plowing. It also illustrates the adaptation of the Eagle tractor to belt work. In the body of this convincing advertisement are given seven logical and powerful reasons why every farmer should buy a tractor on general principles and seven strong claims of the Eagle tractor in particular. A tractor will do the work that a horse will and many things that a horse cannot do and it will do them quicker and cheaper. Eagle tractors are built with special reference to the needs of the medium-sized farms and farming conditions in Wisconsin. They are powerful, economical and reliable and are giving splendid satisfaction to users everywhere. If you want to know more about tractor farming in general and Eagle tractors in particular fill out the coupon attached to their advertisement and mail it to Eagle Mfg. Co., 671 Winnebago St., Appleton, Wis., mentioning The Wisconsin Farmer, and you will receive free an interesting book from their.—Adv.

PART of the Holstein herd of Frank Holt & Son, Pleasant Prairie, Wis.

Pullman Automobile for $740 a Beauty.

ON page 8 are set out the specifications of the Pullman automobile for $740, that has attracted so much favorable attention and proven its worth as a farmer's car. The Pullman is built for comfort, as well as wear, and its ample lines are appreciated by anyone who has ever been compelled to ride in cars where they were cramped for room. It rides smoothly and easily and is like an easy chair. A glance at the picture shown in the advertisement will convince anyone of its beauty of design, while a ride in one will leave no doubt that the makers have succeeded in their ambition of building an ideal machine for town and country use. If you have not known these facts it will pay you to send for their beautiful catalog, addressing Pullman Motor Car Co., York, Pa.—Adv.

Get This Incubator Book.

YOU can depend implicitly on the value which Wisconsin incubators will give you, because they are shipped on thirty days' trial, with freight prepaid east of the Rocky mountains, and if not perfectly satisfactory you can get your money back. They are also guaranteed for ten years by a firm whose guarantee is absolutely good. Their 130-egg incubators and brooders, which have proven their worth as result getters in many a contest, sell for $10 for the two. They are made of finest select California redwood, with hot water heater, double walls, double glass doors, copper tanks and boilers and they are self-regulating. They are complete as shipped and operate at a minimum of cost and bother. Their 1916 catalog is a book that poultry raisers will find valuable and interesting. It tells of many "Wisconsin" merits and triumphs. When writing for your copy address Wisconsin Incubator Co., Box 102, Racine, Wis., and kindly mention their advertisement on page 27.—Adv.

James Sanitary Stalls Only $4.75.

SANITARY barn equipment lessens farm work and increases farm profits. It will pay for itself many times over both in saving labor and in helping keep your cows healthy. On page 8 the James Mfg. Co. is advertising sanitary stalls for as low as $4.75, which are the same as the higher priced stalls, excepting that the latter have some extra features. The James line of barn equipment has long been a standard and has proven its value, practicability and durability wherever used. If you are thinking of building a new barn or of remodeling the old one it will pay you to write them, telling how many cows you keep, and they will send you their valuable booklet entitled, "The James Way," showing how to build and equip an up-to-date dairy barn. In writing them address James Mfg. Co., DU63 Cane St., Ft. Atkinson, Wis., and please mention The Wisconsin Farmer.—Adv.

"Velvet for Dairymen."

THE Sharples Separator Co. is authority for the startling statement that the loss from imperfect cream separation on the average farm is $47 every year and on many farms it is more than $100. One of the causes of this loss is said to be inability to turn the separator at just the right speed all the time. The new suction feed on Sharples separators enables the bowl to take in just the right quantity of milk to insure the closest skimming, no matter how fast or how slow you turn. You get cream of smooth, even quantity no matter at what speed, which means extra profit for dairymen. You can learn all about this new patent device by replying to their advertisement on page 19, and asking for their free book, "Velvet for Dairymen." In writing address The Sharples Separator Co., Dept. 44, West Chester, Pa. Mention of this paper will be appreciated.—Adv.

Cream Separators From $15.95 Up.

THE American Separator Co., has cream separators that are guaranteed to do your work satisfactorily at prices of from $15.95 up. The bowl is easily kept clean, the mechanism simple and along the most approved scientific lines and they are sold on your approval after a careful test. For a handsome free catalog, showing you American separators adapted to any size dairy, address American Separator Co., Box 4126, Bainbridge, N. Y., and kindly refer to their advertisement on page 18.—Adv.

Percheron and Belgian Stallions for Sale.

THE advertisement of Champlin Brothers, Clinton, Iowa, offering imported and home-bred Percheron and Belgian stallions for sale will be found on page 38 of this issue. These animals have size, bone, quality and action and range in age from yearlings to six year olds. They will be sold at reasonable prices on terms to suit the purchaser. Every horse will be guaranteed.—Adv.

Justice's Percherons and Belgians.

SOME imported Percheron and Belgian stallions are for sale by J. R. Justice, Union Hotel, Galesburg, Ill., who has also some good, rugged Belgian mares. The horses are all in good shape, with quality, size and conformation and will be priced worth the money. Mr. Justice has an announcement on page 38.—Adv.

Easy Terms on Edison Phonographs.

YOU can get one of the new Edison phonographs, with your choice of records, on trial and if not satisfied

Field Men for The Wisconsin Farmer.

can return them, or if you desire to keep this wonderful home entertainer you can pay for it at the rate of only $1 down and the balance at the rate of a few cents a day. If you have not seen the new Edison book you can get one without any obligation on your part by addressing F. K. Babson, 4482 Edison Block, Chicago, Ill., and mentioning the advertisement on page 15. —Adv.

Stump Land Means Money Wasted.

STUMP land means, to a large extent, unproductive land and unproductive land means smaller profits than you should be getting. No good business man will allow part of his capital to die idle when it might just as well be paying him good profits and every farmer with stump land should get it cleared and set it to work for him with a crop this spring. One of the easiest, quickest and cheapest ways to do this is to blast out the stumps with Du Pont Red Cross farm powder, as thousands of farmer users have learned to their advantage. There are many things which this farm explosive can be used for that will save time, work and money for every farmer. There is a constantly growing use of powder on the farm and the up-to-date man will want to know all about its advantages. By writing for the Hand Book of Explosives No. 35F, mentioned in the Du Pont advertisement on page 14, our readers will receive free complete and reliable information on this subject. Address E. I. Du Pont De Nemours & Co., Wilmington, Del., and kindly mention this paper.—Adv.

Liberal Service a Velie Feature.

ONE of the greatest considerations in buying an automobile these days is the kind of service which goes with it after you have paid for the machine. The Velie Motor Vehicle Co., Moline, Ill., do not believe that their interest in a customer ends when the sale is made. They are fortunately located in the heart of the grain belt where they can furnish factory service to their large circle of customers among our readers. In dealing with them you are dealing with old friends who have been tried and found worthy and on whose liberal treatment you can rely. In their advertisement on page 13 is shown a picture of their famous new model 22 with detachable winter top and a summer top for $1,240. If you will write for their fine catalog you will find it interesting and instructive. Address Velie Motor Vehicle Co., 118 Velie Place, Moline, Ill. Mention of their advertisement in this paper will be appreciated.—Adv.

NEWS OF THE SALE RING

Hetts' Holstein Sale.

One of the greatest, if not the greatest, Holstein sales in the middle West was staged at Fort Atkinson, Wis., Tuesday, February 15th, in the dispersion sale of the herd of George Hetts & Son. This highly successful sale demonstrated the high reputation which this excellent herd had established. It also demonstrated that the farmers still hold great confidence in the breeding of pure-bred Holsteins. As one breeder expressed it, "If reasonable care is used you can't help but win," and that this belief is stronger than ever is plainly demonstarted at this sale, five animals selling consecutively in twenty minutes' time for $14,000. The top-price female, Crescent Beauty Butter Maid, sold for $3,200 to R. E. Haeger, Algonquin, Ill. The top-price male sold for $2,600 to Henry Anthes, Jefferson, Wis. Mrs. K. H. Miller, owner of The Barrington Farms, Barrington, Ill., was present and judiciously selected a number, purchasing fourteen of the best. C. De Voise, Jacksonville, Fla., who recently closed out 150 head of high-grade Holsteins, purchased a goodly number. There were a great many buyers from out of the state present, who bought a few and will spend the balance of the week visiting various parts of the state, picking up enough more to make out a carload each. Wisconsin buyers from every part of the state were present and took home the major part of the offering, demonstrating that Wisconsin is still a heavy buyer of pure-bred dairy cattle. A detailed list of the sale is given below:

MALES.

Crescent Beauty Butter, Jan. 24, 1912; W. H. Wilson, Ft. Atkinson, Wis.	$825
Crescent Beauty Segis Pontiac, May 3, 1914; H. Anthes, Jefferson, Wis.	2,600
No. 3½, bull calf, Oct. 21, 1915; R. E. Haeger, Algonquin, Ill.	400
No. 4¾, bull calf, Jan. 1, 1915; R. Royce	330
No. 15½, bull calf, Aug. 12, 1915; J. C. DeVoise	120
No. 18¾, bull calf, one year old; Jens Thorstad, Derfield, Wis.	75
No. 21¾, bull calf, Dec. 15, 1915; Edgewater Stock Farm	95
No. 28½, bull calf, May 3, 1915; O. H. Hanson, Cambridge Wis.	135
No. 31½, bull calf, Dec. 17, 1915; Edgewater Stock Farm	55
No. 34½, bull calf, Dec. 13, 1915; C. W. Hodge, Milton Jct., Wis.	50
No. 35½, bull calf, Dec. 13, 1915; R. E. Haeger	130
No. 39½, bull calf, Nov. 7, 1915; H. Yandry, Ft. Atkinson, Wis.	60
No. 40, Sept. 2, 1914; Fred C. Westphal, Bonduel, Wis.	110
No. 49, bull calf, October 15, 1915; Edgewater Stock Farm	60
No. 50, bull, Dec. 15, 1915; Edgewater Stock Farm	55

FEMALES.

Star Belle De Kol, Sept. 20, 1902; Otto Toepfer, Madison, Wis.	165
No. 1½, heifer, Dec. 25, 1915; C. De Voise, Jacksonville, Fla.	295
Beryle Queen, April 6, 1904; Otto Toepfer	165
Lucy De Kol Wayne, Oct. 2, 1903; R. E. Haeger	500
Crescent Beauty Canary, Dec. 13, 1907; H. S. Royce, Seattle, Wash.	450
No. 4½, Jan. 13, 1914; H. S. Royce	345
Madrigal Johanna Aaggie, Jan. 18, 1907; Edgewater Stock Farm, Ft. Atkinson, Wis.	540
No. 5½, heifer, Sept. 1, 1914; Barrington Farms, Barrington, Ill.	275
Agatha Netherland De Kol Pietertje, Dec. 2, 1904; Edgewater Stock Farm	300
No. 6½, heifer calf, Nov. 29, 1914; Harold Ward, Avalon, Wis.	200
No. 41, Nov. 29, 1914; M. H. Meagher, Chippewa Falls, Wis.	250
Grace of Portage De Kol, Nov. 14, 1904; Edgewater Stock Farm	2,250
Sadie Vale Madrigal, Feb. 4, 1906; Mrs. K. H. Miller, Barrington Farms	425
No. 45, heifer, two years old; Barrington Farms	300
No. 8¾, heifer calf, Jan. 30, 1916; Barrington Farms	185
Crescent Beauty Butter, Sept. 13, 1909; R. E. Haeger	3,200
Canary Duplicate Butter Girl, Nov. 28, 1908; Roy Hetts, Ft. Atkinson, Wis.	800
Canary Dpulicate Pride, Jan. 3, 1910; F. E. Daniels, Ft. Atkinson, Wis.	1,325
Crescent Beauty Canary, Geo. Linsley & Son, Manawa, Wis.	190
Crescent Beauty Butter Girl, Oct. 31, 1908; W. H. Wilson, Ft. Atkinson, Wis.	410
Crescent Beauty Butter Girl 2d, yearling heifer; W. H. Wilson, Ft. Atkinson, Wis.	305
Heilo Abbekerk Hengerveld, Oct. 8, 1909; Barrington Farms	320
Salma Pontiac Johanna, May 1, 1910; K. Olaus Finseth, Kenyon, Minn.	470
Ollie Johanna Hengerveld, Nov. 20, 1910; Barrington Farms	500
No. 17¾, heifer calf, Dec. 10, 1915; J. C. De Voise	200
No. 17½, heifer calf, Dec. 7, 1914; M. H. Meager	225
Star Belle De Kol Pontiac, Oct. 15, 1910; Barrington Farms	510
No. 18½, heifer calf; Barrington Farms	230
Grace of Portage Hengerveld, Oct. 20, 1910; Wm. Kittleson, Mt. Horeb, Wis.	275
No. 19½, heifer calf, Dec. 13, 1915; Wm. Kittleson	125
Grace of Portage De Kol Lyons, Feb. 11, 1911; R. E. Haeger	1,225
No. 20½, heifer calf, Jan. 16, 1915; R. E. Haeger	250
Sadie Vale Netherland Johanna, Feb. 7, 1911; Barrington Farms	580
No. 21½, heifer calf, H. S. Royce	385
Elzevere Crescent Beauty Canary, Dec. 1, 1911; T. E. Getzelman, Hampshire, Ill.	280
No. 23½, heifer Calf; T. E. Getzelman	185

Heilo Abbekerk Butter Maid, Apr. 20, 1914; Barrington Farms	285
Madrigal Johanna Aaggie 2d, Feb. 22, 1913; E. Benson, Milwaukee, Wis.	290
No. 48, R. Hetts	340
No. 41	250

SUMMARY.

15 males ... $5,100; average	$340.00
54 females..$25,930; average	$480.18
69 animals..$31,030; average	$449.77

THE MARKETS.

Union Stockyards, Chicago, Ill., February 19th.—Last week's severe raid on cattle values had the expected effect of curtailing the marketward movement this week, and prices have been pushed upward almost as fast as they declined the week previous. While a supply at six western points the first five days of the week aggregating 32,000 less than like period last week was the chief influence in the improvement of the trade, the reopening of the stocker outlet at this market, closed November 1, 1914, on account of foot-and-mouth disease, has been a price-boosting factor of some importance. The stocker outlet so far has been narrow owing to the delinquincy of eastern states in lifting the embargo, Ohio and Indiana, as well as some other states which ordinarily receive liberal supplies of stockers and feeders from this market at this time of the year as yet refusing to accept Chicago shipments, but the outlet is expected to broaden gradually with the relaxation of existing state embargos which will give the lighter-fleshed cattle a competitive market right along.

Advances in the steer trade during the week are mostly 25@40c and some sales show a 50c gain. The bulge restores prices on the general run of offerings to within 10@25c of the year's high point. It will be well, however, for the country to display caution, as it is easy to get a few too many cattle. Lent begins March 8th and buyers usually use that effectively as a bear argument. This is always a period of liquidation, but the fact must not be overlooked that liquidation has been on a free scale for three months past and that in many sections where feed lots are normally full at this time cattle are now scarce. March and April ought to develop a good set of markets.

Barring five head of prime steers fed experimently at the Illinois University and selling at $10.25, the top this week has been $9.65, but choice heavy beeves have been scarce and comparatively few have passed the $9 mark. Much of the steer run sold at $7.50@8.75, with a much smaller proportion under the $7 line than last week. The advance has been rather more pronounced on steers selling from $7.25@8.75 than in the top or lower registers of the market. Feeder competition has developed below the $7.25 line and the bulk of the stockers going to the country sold from $6.50@7.00 with choice toppy yearlings at $7.25 and a few common off-colored thin stockers down to $5.50 @6.00. A good demand, especially for stocker grades to throw on grass in the spring is expected to develop.

Desirable killing classes of cows and heifers have recovered their decline of last week, 25@40c advances being general and some good tidy heifers being quoted 50c higher. Common kinds have not shared fully in the advance, but barring Holstein stuff which is getting strong price discrimination, most of the cows selling below $5.25 are 10@15c higher. Bulls are 15@25c higher for the week, barring big weight beef bulls and choice calves are about steady, while plain, light veals show about a 25c decline. Most of the butcher cows are selling at $5.50@6.50 with choice koshery corn fed cows up to $7 and above and common long-haired kinds at $5@5.25, some Illinois Holsteins of butchery class going down to $4.75 and below. Most of the good to choice fat heifers are selling at $6.65@7.40 and choice corn-fed yearlings are worth $8 and better. Heifers now selling at $5.50@6.00 are on the stocker order and a trashy off-colored kind goes down around $5. Bologna bulls are on a $5.75@6.15 basis for the bulk, and good to choice handy weight butchers sell at $6.25@7.00, but $6.25 is hard to pass for a 1,700-pound or heavier fat bull no matter how ripe. It is largely a $10.50@11.00 market for good to choice veal calves, with a plain light kind around $10, underweights from $7.00@7.50. Most of the heavy calves are going at $6.50@7.50, choice 300-pound weights up to $8.50 and common rough heavies down to $5 and under. Quotations follow:

NATIVE BEEF STEERS.

Ch. to pr. 1,500-1,600 lbs.	$9.00@10.00
Gd. to ch., 1,300-1,450 lbs.	8.50@ 9.00
Med. to gd., 1,250-1,350 lbs.	7.50@ 8.35
Plain short-fed	6.25@ 7.25
Poor to plain steers	5.50@ 6.25
Choice to prime yearlings	9.00@10.00
Good to choice yearlings	8.25@ 9.00
Medium to good yearlings	7.25@ 8.00
Plain to fair yearlings	6.25@ 7.00
Common yearlings	5.25@ 6.00

STOCKERS AND FEEDERS.

Good to choice	$6.85@7.40
Fair to good	6.35@6.85
Common to fair	5.85@6.35
Inferior, off-colored stockers	5.25@5.75

HEIFERS.

Extra fancy yearlings	$8.25@8.00
Good to choice yearlings	6.75@8.00
Good to choice heifers	6.50@7.25
Fair to good heifers	6.00@6.50
Common to plain heifers	4.75@5.75

COWS.

Choice to prime	$6.75@7.50
Good to choice	6.00@6.50
Plain to good	5.25@6.00
Fair to good cutters	4.50@5.15
Fair to good canners	3.90@4.25
Common canners	3.00@3.75

BULLS.

Good to prime butcher	$6.50@7.00
Plain to medium butcher	6.15@6.35
Good to choice heavy	6.10@6.50
Good to choice bolognas	5.85@6.25
Plain to medium light	5.00@5.75

CALVES.

Prime vealers	$10.75@11.25
Good to choice vealers	10.25@10.50
Poor to fair vealers	7.50@ 9.50
Good to choice heavy	6.50@ 8.50
Poor to fair heavy	4.50@ 6.25

While closing 5@10c lower than a week ago, the hog market showed the best levels of the season during the week, an $8.50 top being recorded on the high spot Thursday and the bulk selling on that session at $8.15@8.40. A 5@10c decline Friday carried the general average price down to $8.23, which is $1.75 per cwt. higher than the corresponding day last year. Bulk sold Friday at $8.05@8.35 with few hogs, other than common underweight stuff and rough, heavy packers, below the 8c line. Pige of good class were on a $6.75@7.25 basis. The coming week will doubtless attract a generous run of March 1st contract and renters' hogs, but much of the liquidation that under ordinary circumstances will occur at this juncture has already been effected and confident prediction of $9 top hogs in March is made. Given proper encouragement, however, the tail end of a big winter crop, such as that of this winter, usually results in a more liberal supply of good fat hogs at the windup than most traders figure on, and the rapid advance in the market the last forty days in the face of unusually heavy receipts, has doubtless persuaded some farmers and feeders to hold back even under the high price of corn, and feed hogs to a heavier weight than originally intended, the lure of the $9 hog during the early spring being a magnet of strong drawing power. The range in prices has widened out somewhat this week, owing to the presence of more light stuff in the run, but it is still comparatively narrow. Receipts for the first five days of the week at eleven leading markets totaled 714,000, as compared with 779,000 same period last week and 565,000 a year ago. Since January 1st, these eleven points have received 6,211,000, against 4,982,000 same period of 1915.

HORSES.

IMPORTERS AND BREEDERS OF

PERCHERON, BELGIAN AND CLYDESDALE STALLIONS AND MARES

WE now have in our barns more big-boned, rugged draft colts, from yearlings to 4 and 5 years, of the different breeds than ever before. We have two-year-olds that weigh over a ton—herd headers and show propositions.

Five farms over 1,000 acres devoted to the horse business. We do all our own buying and selling, grow all our own feed. Our economical way of handling stallions saves money for the purchaser. We guarantee all horses sold and can sell you a high-class stallion cheaper than any other firm in America.

We are located in North Central Iowa, 20 miles from the Minnesota line, on the C. M. & St. P. Ry., midway between Mason City and McGregor.

Send 20c in stamps for large Horse Hanger which shows our Main Farm and sales stables. Correspondence a pleasure. **We have a horse for every purse.**

FRANK P. SHEKLETON & SONS, LAWLER, CHICKASAW CO., IOWA

PERCHERONS AND BELGIANS

I HAVE just a few imported Percheron and Belgian stallions, and they are extra good. Also a number of big, rugged, imported Belgian mares. All will be priced to sell. Bell phone 237 or Union Hotel.

Willys Knight

Sleeve-Valve Motor

For Better, More Constant, Longer Service

Let the city man have his poppet-valve motor if he wants one.

His garage around the corner will take care of it for him—"tune it up" frequently and remove the carbon and re-seat the valves every few thousand miles!

But you probably have no such nearby facilities.

You have to be without your car for days—maybe weeks—when engine repairs are necessary.

The great Daimler—England's best known motor car builder,—says: "if there is no repair shop within miles, own a Knight Motored Car."

It will give you far the most constant service—far the greatest total mileage.

For instead of getting noisy and losing power and flexibility, as all other types of motor must, from the very nature of their construction,—

The sleeve-valve motor will steadily improve with use without any attention beyond oiling.

Carbon in the sleeve-valve motor only makes it run the smoother and quieter—only gives it greater power and flexibility.

And it will serve you more and more efficiently for literally thousands of miles beyond the life of any other type of motor.

We believe the Willys-Knight is the most economical car, in the long run, which a farmer can buy.

It will give him oetter, more constant, longer service than any other car at anywhere near the price.

See the Overland dealer now and talk it over with him.

Catalog on request. Please address Dept. 368.

Fence Your Farm The "APEX WAY"

Save Work and Money

THESE two books will tell you how you can save work and money and have better looking fence the "Apex Way." Let us send them to you free. They show how easily you can put up APEX fence — how the "swinging joint" lets it fit hilly ground as readily as level stretches, and how it keeps its shape and always looks neat.

Save Post Hole Digging
By Using
APEX Steel Drive Posts

They cost less to use than wood posts and outlast a generation. Can be driven into any soil, gravel or soft shale rock. Made of elastic carbon angle steel—the strongest and toughest post material known. Use Apex Posts for your next fence—save work—save 8 to 10 cents in setting each post—have better looking fence—burn fence rows clean—ground the lightning and protect stock.

Write for Free Books
Read the helpful hints on fence building that save money, time and hard work.

CURRENT EVENTS

ENGLAND is not ready even to consider the possibilities of peace, according to Premier Asquith, who delivered a ringing speech on the subject in parliament. The only terms the fighting premier offered to the enemy countries were contained in this utterance: "We shall never sheath the sword, which we have not lightly drawn, until Belgium—and, I will add, Serbia—recover in full measure all and more than they have sacrificed; until the rights of the small nations of Europe are based upon an unassailable foundation, and until the military domination of Prussia is wholly and finally destroyed." The announcement of the premier was brought about by a peace talk made by one of the members of the house of commons, a talk which the other members showed they had but little sympathy for. While this discussion was going on in the British parliament the French and the Germans were renewing activities, the Germans beginning a terrific drive with 240,000 men, against the French stronghold of Verdun. This is the most formidable move since the Champagne campaign last September and is for the purpose of trying out the two lines, to see which is the stronger. There is plenty of evidence that the hard fighting will be resumed very soon now, for but little has been accomplished by either side during the winter months.

NATIONAL preparedness legislation took a long step forward in congress last week when the house military committee reached a practical agreement on the outline of the army bill it will unanimously present for passage. Complete federalization of the national guard will be substituted for the proposed continental army. A total peace strength of 575,000 men in the standing army and the guard combined will be provided for, with reserve systems to more than double the force in war. The expense for the whole establishment this year is roughly estimated at $174,000,000 exclusive of Panama canal defenses. To complete the committee's compromise with President Wilson on the continental army, the bill will authorize the increase of the regular army to a total peace strength of 147,000 by adding ten regiments of infantry, four regiments of field artillery, fifty-two companies of coast artillery, fifteen companies of engineers and four aero squadrons. It will provide also for doubling the cadet corps at West Point and creation of thirty cadet companies to be attached to regular regiments to be trained for entry into an officers' reserve corps. Congress is making more rapid headway on this matter than had been anticipated, party lines being well-nigh obliterated in the discussions so far.

THE war has cost Great Britain over $10,000,000,000 to date and last week the house of commons passed an additional credit bill for $2,000,000,000. This is expected to carry the war to the end of May. In Premier Asquith's speech to the house it developed that the war is costing England $25,000,000 a day, a figure which the premier declared to be very reasonable. The chancellor of the exchequer praised England's unimpaired credit, saying: "It is an absolute marvel that after eighteen months of war we are still an open gold country. Our paper can be exchanged for gold at the bank. Every sovereign in paper money has gold back of it. It would never have been believed two years ago that British credit could stand the extraordinary test to which it has been subjected. Notwithstanding the gigantic expenditures we have maintained our credit. We have great resources, but must husband them with prudence. I have no doubt that a year hence I shall be able to show that our credit is still unimpaired." With the end not yet in sight England alone, among the half dozen great powers involved, has already spent a fabulous sum, which, as Premier Asquith rightly says, is "not only beyond precedent but actually beyond the imagination of any financier of this or any other country."

THE proposal to amend the income tax law so as to include smaller incomes is certain to be abandoned in favor of an increased rate on those already taxed. Sentiment against lowering the exemption limit ($3,000 for the unmarried and $4,000 for the married) in order to provide additional revenue for the preparedness program has crystallized in congress within the last few days. Leaders now declare that virtually the entire preparedness revenue burden will be met with income taxes. One of the democratic leaders who will be active in framing the administration bill said he would suggest doubling the present 1 per cent rate on incomes below $20,000 and possibly make the tax on incomes above that amount as high as 8 per cent. He also might suggest lowering the minimum income subject to the 1 per cent rates to $15,000, he said. Married men, he said, according to the plan, would be given the advantage of an additional $1,000 exemption as in the present law.

AN INTERESTING interview with King Peter, of Serbia, was printed in the daily newspapers recently. King Peter is literally a man without a country, for he escaped from fire and disease-stricken Serbia only by disguising himself and riding in an ox wagon and is now forced to take refuge on Greek soil. Notwithstanding the fact that the enemy has almost complete possession of his land and his people are either killed or scattered far and wide, the king remains hopeful of the day when Serbia will again be for the Serbs and the Serbian cause will triumph. He expressed this hope in these earnest words: "I believe in the liberty of Serbia as I believe in God. It was the dream of my youth. It was for that I fought throughout my manhood. It has become the faith of the twilight of my life. I only live to see Serbia free. I pray God to let me live until the day of the redemption of my people. That day I am ready to die if the Lord wills. I have struggled a great deal in my life and am tired, bruised and broken from it." Serbia has suffered even more in the war than Belgium, for it was decimated by disease epidemics and then fearfully harrowed by the Teutonic armies, but despite all this King Peter continues hopeful of the dawn of a better day.

SEN. ROBERT M. LaFOLLETTE, of Wisconsin, has announced his candidacy for the republican nomination for president. The announcement came at a conference of the progressive element of his party, the primary vote of Wisconsin and North Dakota being pledged to him. If these pledges are fulfilled Senator LaFollette will go into the Chicago nominating convention with at least thirty-six votes, a strength to be seriously reckoned with in the final analysis. The list of "favorite sons" in the grain belt is now quite formidable, including Senator LaFollette, of Wisconsin; Senator Cummins, of Iowa, and Senator Sherman, of Illinois, in the republican ranks. There is no avowed candidate against President Wilson in the democratic party, so that the main contest here in the middle West will be in the republican ranks.

ANOTHER SHORT-HORIN HERD BOOK.

Vol. 86 of the American Short-horn herd book is now ready for distribution. It contains 20,000 pedigrees, of wihch 9,000 are bulls numbered from 412,001 to 421,000, and 11,000 cows numbered from 182,001 to 193,000. This volume sells to non-members for $2, charges prepaid, and those interested should write American Shorthorn Breeders' Association, 3 Dexter Park Ave., Chicago.

Chicago STEEL FENCE POSTS

Can't Help But Save You Money
They cost less to install—last a lifetime without repair. They guard your crops from insects that live in wood posts and fence-line weeds. With them you can burn clean through your fence, kill the insects and gain more tillable land. Build your new fence and replace rotting wood posts with Chicago Steel Posts. *Made from same material used in old black wire.*

Guard Your Cattle With These Posts
A wood post wire fence exposes your cattle to lightning. *Wood posts will not ground lightning—Chicago Steel Posts absolutely will.* Let us tell you more about these posts and explain how you can save the price of an automobile.

The Wisconsin Farmer

THURSDAY, MARCH 2, 1916.

FAMILY CIRCLE TALKS
BY THE PUBLISHER

PRESIDENTIAL PRIMARY DATES.

I AM in receipt of a number of letters from farmer friends asking me what the situation is in regard to presidential primaries in their states. Perhaps the best way to answer them will be a general article setting forth conditions throughout the grain belt generally.

I am delighted to be able to state that in seven out of the ten grain-belt states direct presidential primaries will be held this spring, giving farmers the right to vote directly for the men whom they want to head the national tickets. Altogether, presidential primaries will be held in nineteen states. It will thus be seen that the movement to give the people, rather than the bosses, the deciding voice and vote has gained greater headway here in the middle West than in any other section of the country, for over two-thirds of the states enjoy the privilege here, while in the United States as a whole the proportion is only two-fifths.

For the convenience of my readers I print herewith a table showing the dates when presidential primaries will be held in the grain-belt states, together with the number of delegates to which each state is entitled. I will arrange the states in the order of their primaries:

State	Date of primary	No. of delegates
Minnesota	March 14	24
North Dakota	March 21	10
Wisconsin	April 4	26
Iowa	April 10	26
Illinois	April 11	58
Nebraska	April 18	16
South Dakota	May 23	10
		170

It will thus be seen that with 170 delegates to both the republican and the democratic national conventions, elected by their direct votes, the farmers of the grain belt will have a bigger part to play in naming party leaders and deciding party policies than they have ever enjoyed before. I rejoice that this is so. It marks a new day in our political life.

The candidates duly placed in nomination in these seven states of the grain belt are rather numerous and include a number of "favorite sons." From reports which have reached me from all of the states I am able to say that President Wilson seems to have a clear field in his party, while the republicans have a large field from which to choose, the most prominent candidates in that party whose names are sure to go on the ballots in these seven states being Theodore Roosevelt, Albert B. Cummins, Robert M. LaFollette, Laurence I. Sherman, Henry G. Estabrook and William G. Webster. With the exception of Mr. Estabrook, who is a New York lawyer, and Mr. Webster, who is a Chicago lawyer, all of these men are doubtless known to my readers. Three "favorite sons" are included in the list (LaFollette, of Wisconsin; Cummins, of Iowa, and Sherman, of Illinois), so that the grain-belt vote may confidently be expected to be quite scattering.

There is only one thing that mars the view as we survey the situation in the grain belt, and that is that while Illinois is listed as a "suffrage" state the supreme court has ruled that Illinois women are not entitled to vote for national delegates. I sincerely hope that this situation will have been corrected long before the next national campaign. Iowa, in all probability, will have adopted equal suffrage before the 1920 campaign, so that the women of the Hawkeye state may content themselves this year with the thought that this is the last presidential campaign in which their voice, vote and influence will not be directly heard and felt.

It is not my intention to enter upon a discussion of the merits and qualifications of the various candidates at this time. I am simply setting forth facts which may help you in measuring up to the full stature of citizenship. No man should fail to exercise the prerogative of suffrage because there is work to be done in the field, the feed lot or the office on primary day. I earnestly hope that every one of the farmers of Wisconsin, Iowa, Minnesota, North Dakota, South Dakota, Nebraska and Illinois will go to the polls on the days their primaries are held and exercise the right which progressive legislatures have granted to them. It is a boon which all who enjoy should exercise without fail. Only by getting down to the very foundations of our political life can we hope to bring nearer to hand the ideal government, which depends, in the last analysis, fairly and squarely upon the vote of the individual, the farmer fully as much as the city man.

SAFETY AT THE WHEEL.

I AM in receipt of a letter from a subscriber urging me to support a proposed law making it a misdemeanor for an intoxicated person to attempt to drive an automobile. I replied that I proposed such a law, in these columns, some months ago, and that I shall be only too glad to do what I can to see that such a measure is placed upon the statute books not merely of one state but of all our states.

The same mail which brought me this letter brought another telling of how justice had been meted out to a speeding automobilist who struck and seriously injured a young farmer. Now, ordinarily, the guilty driver would have been sued for damages and, if the victim had a good lawyer and the case was clear, he might have been compelled to pay a few hundred or a few thousand dollars damages. But this money, nine cases out of ten, would not come out of his pocket, for most city drivers carry liability insurance protecting them against such contingencies. Therefore, the damage suit and the verdict would not be much of a lesson or a deterrent to future speeding. But in the case just reported to me the speeding driver was arrested, was charged with attempted manslaughter, was convicted of assault with intent to commit great bodily injury and was sentenced to the state reformatory. I do not know the driver; he may have a family dependent upon him; I know none of the outside circumstances. I do believe, however, that a few such instances, with the law invoked summarily and severely, will tend to make all automobilists more careful and to think twice before they drink intoxicating liquors (as this driver had done) and then go out upon the public highway with their minds so befogged they cannot, in an emergency, tell the brake from the clutch or reverse from high speed forward.

Automobile driving is really less hazardous and dangerous to life, limb and property than might be thought. I have seen it figured out, and apparently quite logically, that there are fewer accidents, per mile traveled, by automobile communication than by any other method of getting about. When we consider that there are something like 2,000,000 or 2,500,000 motor cars in the country and each one travels about 5,000 miles a year, it is easy to see what an immense mileage is covered by horseless carriages in a year. Looked at in this way the number of accidents is small. But, small as it is, it is still too large.

Motor accidents are sometimes unavoidable, but when they are caused by drink or reckless speeding the driver should be summarily haled before a court of justice and dealt with promptly and without leniency. I hope my friend will be successful in getting his proposed law put upon the statute books of his state. Whatever views we may have on "personal liberty" as applied to prohibition, the fact remains that whisky and gasoline do not mix well. With from 25,000 to 200,000 automobiles in each of the ten states of the grain belt, dashing back and forth along country roads and city pavements at breakneck speed, it is high time we all resolved to see that more caution and common sense were put into our motor driving.

FREE SEED GRAFT AND THE R.F.D.

LETTERS setting forth the deplorable condition in regard to the R. F. D. service continue to pour in upon me. Some twenty or more came in one mail today. Two of the writers had gone to the trouble to figure out how far they are obliged to travel, now that the department has "reorganized" the service, in the interests of bogus economy, compelling the carriers to attempt to cover fifty miles every day, rain or shine, snow or storm. Both the writers state that under the old plan the mail was brought to their front door; today one has to travel 383 miles a year, the other 480 miles a year to obtain his mail. One writer tells of three neighbors who are obliged to go from one-half to three-quarters of a mile each to get their mail, while the carrier doubles back on his tracks a mile in order to serve only two patrons, leaving the three to obtain their mail as best they can. All this is manifestly unfair and unnecessary. All the farmers who complain ask is that the routes be put back on the old basis; they were perfectly satisfied before the order came out from Washington doubling routes and vexing practically everybody, patrons and carriers alike.

One of the best and most practical suggestions I have seen comes to me from Mr. W. P. Adams, proprietor of Elk View Farm, near Edgewood, Iowa, who says that the combining of routes in his neighborhood makes it necessary for some farmer patrons to travel a mile for their mail and deprives others of the R. F. D. service altogether. Mr. Adams then continues:

> I think every farmer ought to have his mail brought to the door. Why should some farmers have their mail left at their door and others have to go a mile or more when they don't pay any more for the service than the man a mile away?
>
> One inspector that was here last spring said a farmer ought to be satisfied to get his mail within a mile. We might just as well have it left at the postoffice—we would get it just as often.
>
> I received a package of garden seeds the other day, from our congressman, G. M. Haugen. When I got it the thought came to me—if congress would cut out this seed graft and use the thousands of dollars spent for seeds to improve the R. F. D. service the farmer would appreciate it a thousand times more than getting a few seeds, which he is able to buy himself, and I would rather pay some for the service, if Uncle Sam isn't able, than to go a half-mile for my mail.
>
> The farmer that does not get his mail every day gets behind reading his papers and some will not be read. Yours for better R. F. D. service,
>
> W. P. ADAMS.

Mr. Adams does well, indeed, to bring up this matter of the government seed graft in this connection. If the officials at Washington were in earnest in their attempts at reform they would start somewhere else than with the R. F. D. service. They could not make a better beginning than with the perquisites enjoyed by our congressmen, from free seeds to excessive traveling expenses. There is no reason whatever why congressmen should be allowed to burden the mails with cumbersome packages of free seeds which the farmer neither asks for, wants nor is able (in many cases) to make germinate and grow. The farmers of America are not suppliants for charity, especially in the form of mislabeled seeds. If congress and the postoffice department really need and want to save money let them cut out the seed graft, limit the free use of the mails by those officials who now abuse their franking privileges flagrantly and otherwise curtail useless and unjustified expenses. But continue to give the farmer the right to receive his daily mail the same as the city man, to the end that our high percentage of literacy and our widespread average prosperity and progressiveness may be maintained in our rural sections, unimpaired.

SWOLLEN WAR FORTUNES.

I WANT to leave just one little thought with you this week, in regard to the great hue and cry about "preparedness." One of the many gun companies located on our eastern seaboard reports its gross earnings for the past year to be $20,309,085. This was twenty times its capital stock, which is $1,000,000. Now the thought I have in mind is this: Here is simply one of the many munition companies making as much in one year as 7,158 farmers in Wisconsin made in the same time, for government figures show the average annual farm revenue in Wisconsin to be $2,836. And how much greater was the investment demanded of these 7,158 farmers than of the one munition manufacturer. It is conservative to estimate that each and every one of those Wisconsin farmers has $15,000 invested in his farm, a total for the entire 7,158 of $85,896,000, eighty-five times the capital stock of the one munition factory.

Is it any wonder that we find a sentiment in favor of war, and of "preparedness" on a vast and expensive scale, in that part of our country where the arms and munition factories are located and where a few men are becoming immensely rich through the slaughter of millions of their brothers? Should we not eliminate from all consideration the immense effect which war is having upon the already swollen fortunes of these munition magnates and allow the calm, unprejudiced reflection of the producer here in the middle West to decide the issue, rather than the cupidity of those who have already fattened far too much on war's demands for things that maim and kill?

James M. Pierce

THE WISCONSIN FARMER

A WEEKLY JOURNAL OF AGRICULTURE, HORTICULTURE, STOCK RAISING AND ALLIED INDUSTRIES

BY JAMES M. PIERCE

JAMES ATKINSON, Editor-In-Chief

ESTABLISHED IN 1848

Entered at Des Moines Postoffice as second-class matter

PUBLISHED EVERY THURSDAY

1912 Grand Ave. Des Moines, Ia. | 201 Washington Bldg. Madison, Wis.

To either of which communications relating to subscription or advertising may be addressed.

MEMBER AGRICULTURAL PUBLISHERS' ASSOCIATION
MEMBER AUDIT BUREAU OF CIRCULATIONS

SUBSCRIPTION RATES—Single subscriptions, $1.00 a year. In clubs of ten, 75 cents a year and an extra copy to getter up of club. In clubs of fifty or more, 25 cents a year. Single subscription three years in advance, $1.50; five years in advance, $2.25; ten years in advance, $4.00. Subscription prices in Canada, $1.50 a year. Remit by draft, registered letter, postoffice or express money order. In changing address, send both the old and new addresses. In renewing, give the same name and initials as you gave before or state both the old and new names, and explain why you make the change. In case of errors or failure to receive the paper within two weeks. promptly notify the publisher. Address WISCONSIN FARMER, MADISON, WISCONSIN

Seasonable Information For Wisconsin Farmer Folks.

MANY instructive articles will be found in this week's issue of The Wisconsin Farmer relating to the orchard and garden. Seeding time is near at hand and the fruitfulness of the season depends largely upon the wisdom we display in the selection of crops as well as upon the skill we exercise in getting the soil prepared. No theorist will be found in the list of contributors to this week's issue of The Wisconsin Farmer because each and every writer has become known because of his success in practical, everyday affairs.

Mr. W. H. Hanchett, of Monroe county, the same Hanchett who has had such a prominent part in developing the Fruit Growers' Co-operative Society at Sparta, sounds a warning against Wisconsin people shipping away much of their good seed corn this year. His statement in this regard will be found on this page, and it should be gone over carefully by every reader.

It is possible not only to add to the beauty and comfort of the farm home by improving the home grounds, but also to add to the value of the farm place. There is no better way of giving the prospective customer a good impression of the farm home place than to have a good, wide, sweeping lawn, with a proper setting of plants and shrubs. Mr. E. H. Niles, of Oconomowoc, Wisconsin, in an excellent article on page 6, tells how this can be economically done on the Wisconsin farm.

An article has been provided in this issue which will be of special interest to the women. Miss E. M. Goelzer, of Oakwood, tells how every farm woman can have shrubbery and perennial flowers at small expense. Miss Goelzer has had practical experience along this line and her interesting advice will be appreciated by all our farm women. Her article will be found on page 9.

One of our best posted horticulturists in Wisconsin is Mr. C. L. Richardson, of Eau Claire. Mr. Richardson knows from practical experience the value of various varieties, and his suggestions on "How to get the most out of the farm fruit patch," on page 10, will be found of great interest to every Wisconsin Farmer reader.

A number of special articles along horticultural lines appear this week under the Fruits and Garden department heading, and these are all on practical subjects of interest to Wisconsin farmers.

A new grass, with which some experiments have been made in Wisconsin, is known as Sudan grass. Mr. George B. Mortimer, of the Wisconsin station, is perhaps better equipped to write on this subject than any man in the state, and for this reason we direct special attention to his very interesting article on page 16 of this issue.

There is a good deal of powder used in blasting in Wisconsin for the elimination of stumps and also for sub-soiling and drainage ditches. The question arises on the Wisconsin farm occasionally how to ignite a series of blasts at one time, using dry cells and a coil instead of a fuse. In response to an inquiry on this subject our Farm Mechanics editor answers this question on page 19.

Paul Johnson, of Stoughton, Dane county, is a farmer-poultryman who has had wide experience and great success. The Wisconsin Farmer has published a number of letters from farmer poultry-raisers. Many of these letters have contained fine suggestions. Mr. Johnson writes us a good, long letter which certainly covers the poultry field, so far as the farm is concerned, and which discusses rations and diseases in a very practical way. No one who raises poultry should fail to read Mr. Johnson's letter this week in the poultry department.

Most of our readers know about the great success which Mr. S. P. Markle, of La Crosse county, has had in raising pure-bred seed corn. Mr. Markle won The Wisconsin Farmer cup at Madison at the recent grain show for the best fifty ears of White Dent corn grown in Wisconsin. On page 13 of this issue will be found a picture of these fifty ears, and they are well worth considerable study.

These special features of this week's issue are provided in addition to the regular departments, which are complete as usual, and which make this one of the best issues of The Wisconsin Farmer.

Keep Wisconsin's Best Seed Corn at Home.

MR. W. H. HANCHETT, a practical and progressive farmer of Monroe county, Wisconsin, has been making a little study of the seed-corn situation, and gave some of his ideas recently at Madison. He says that the farmers of Wisconsin have two important problems to face this season, namely, where is good seed corn to be gotten, and what is the safest variety for 1916. Mr. Hanchett has considered these problems so carefully and answers them so well from his own experience that we quote his own words:

The progressive farmer will have very little difficulty in deciding what variety or varieties he wishes to secure, for that is a matter that he has carefully worked out in past years and he will be guided in the matter by the lamp of his own experience. The corn that he wants is the corn that will give him the maximum yield, and that is reasonably sure to mature in his latitude and particularly on his individual farm. It will not matter to him who originated the variety, whether the catalog man or the agricultural college professor, as performance in the field is the point on which he bases his decision. Neither is he in need of advice in the matter, for he well knows that his own carefully worked out knowledge of the adaptability of varieties to his particular environment is the safest guide in the matter and the chances are that he is among the 25 per cent who have been able to secure their own supply of seed corn and possibly a supply to furnish the unfortunate ones in his own neighborhood.

In my own case there are two varieties that I shall tie to, i. e., the Golden Glow and Silver King. The Golden Glow for crib corn and the Silver King for silage. In my choice of these two varieties there is no admixture of sentiment. They were tried on our farms with the same caution that we try out new introductions and have won out hands down over every other variety that has ever been raised in our community for the purposes for which I plant them. The Golden Glow on my farm on the average season is ready to shock by September 1st and gives us the maximum yield of good sound crib corn. The Silver King on the average season is mature enough for the silo by September 15th and will produce several tons per acre more good silage than any other variety we have ever tried.

In the matter of where to get seed corn the Wisconsin farmer is indeed the most fortunate of all farmers on the northern edge of the corn belt—thanks to the Wisconsin Experimental Association and its co-operative work in grasping the situation early last autumn and saving a large amount of seed by the members fortunate enough to have crops of corn mature enough to produce good seed. Had it not been for the good team work done in this line last fall by this association it would take Wisconsin at least two years to get back on the map as a corn state. As it is, Wisconsin farmers should be prompt to take advantage of the situation and secure their seed at once and not wait till the Wisconsin supply has been exhausted, for acclimated seed is of just as much importance as variety, and if the Wisconsin supply is allowed to go to other states and Wisconsin farmers through neglect are forced to plant southern grown seed the loss in next year's corn crop is likely to be considerable.

Now, just a few words about seed corn in general and I am through. In the corn exhibits which came under my observation during two years of work with the farm institutes, it became very apparent to me that the average farmer has very little idea as to proper type in the selection of seed corn and that there is very great need of education along this line among farmers. Even Silver King with its well-established type had lost its identity entirely after a few years' selection of his own seed by the average farmer. In summarizing the seed corn situation I have this to say, that many farmers will be forced to plant pure-bred seed corn next year that would not otherwise have done so, for the very simple reason that the scrub farmer and his scrub corn lost out last season on the corn crop and the progressive, practical farmer will supply the seed that he plants, for the simple reason that the pure-bred won the race to maturity in a trying season. The practical farmer either has seed corn of his own raising of known germination quality or else has his order placed with reliable parties who have what he wants and is not taking a long chance by waiting till planting time before he orders.

Good Work by Dunn County School.

WHAT an agricultural school may mean to a county was illustrated this winter in Dunn county by the Dunn County School of Agriculture at Menomonie. Some criticism of these county schools, of which there are seven, has been heard in Wisconsin, but they are gradually proving their value to the counties, from an agricultural standpoint, and the extension meetings held in Dunn county in January and February under the direction of Mr. Theodore Sexauer, superintendent, will, without question, result to the advantage of every resident of that county.

Two extension tours were held and approximately 5,000 farmers and interested business men were reached on those two tours. The first tour late in January took in the southern half of the county and reached about 2,700 persons and the second tour, the third week in February, took in the northern half of the county and reached by actual count 2,007 persons. Twelve meetings were held during the February tour, four at Colfax, and one each at Boyceville, Downing, Connorsville, Ridgeland, Sand Creek, Grant town hall, Rusk and Cedar Falls. Mr. C. E. Lee, of the dairy and food commission at Madison, assisted the school faculty on the February tour and told The Wisconsin Farmer that it was one of the greatest weeks of extension work he had ever participated in in the sixteen years he has been working for improved dairying conditions.

The entire faculty of the county school assisted in the meetings and sang and entertained the visitors as well as addressed them. Miss Hermine Knapp, of the domestic science department, talked on farm home conveniences, hair dressing, home making, etc.; Mr. H. F. Good, of the farm mechanics department, on silo construction; Mr. A. H. Pickford, of the animal husbandry department, on the raising of calves and young stock, as well as feeding and feeds; Mr. Lee on the responsibility of the farmer to the creamery operator in the production of good butter, and Mr. Sexauer, when time permitted, on canning clubs and general farm topics.

These meetings carried the work of the county school directly to the farmers. They gave the farmers the chance to get in touch with the simple things that will aid them; that will tend to increase their prosperity and improve conditions in general. That so many farmers took advantage of this opportunity indicates a willingness and a desire to receive tips on the newer things in agriculture, and the Dunn county school has certainly done a lasting service to the county by this extension work, which is an important part of the work of every county school, as only a small percentage of those to be benefited can attend school.

More Money For Dairy Farmer.

HIGH prices for cheese during the past two months have raised the prices for whole milk, all of which is a benefit to farmers of Wisconsin, especially if they are patrons of cheese factories or city milk dealers which are paying on a cheese basis. Cheese prices are around the high-water mark and with a heavy demand from abroad because of the war many dealers are making the prediction that cheese will go higher. Cheese has already reached 18½ cents on the Plymouth board; some has sold as high as 19 cents, and in consequence the factories are paying higher prices now for milk than is the rule.

The result has been that many of the large condenseries in the state have been forced to boost their milk prices to keep their trade, as the farmers in the neighborhood of cheese factories began to deliver to them and quit the condenseries. City milk prices to the farmers in many communities have gone up, and in Fond du Lac, for instance, where one dealer contracted for his milk, agreeing to pay on either a butter or cheese basis, depending on which was higher, paid $1.79 during January for 4 per cent milk. During January the cheese market ruled the higher, and this Fond du Lac dealer paid the following prices, which we are giving here that our readers, selling whole milk, may make their own comparisons:

3.0 per cent milk	$1.31	4.1 per cent milk	$1.79
3.1 per cent milk	1.36	4.2 per cent milk	1.84
3.2 per cent milk	1.40	4.3 per cent milk	1.88
3.3 per cent milk	1.44	4.4 per cent milk	1.93
3.4 per cent milk	1.49	4.5 per cent milk	1.97
3.5 per cent milk	1.53	4.6 per cent milk	2.01
3.6 per cent milk	1.58	4.7 per cent milk	2.06
3.7 per cent milk	1.62	4.8 per cent milk	3.10
3.8 per cent milk	1.66	4.9 per cent milk	2.15
3.9 per cent milk	1.71	5.0 per cent milk	2.19
4.0 per cent milk	1.75		

As Wisconsin produces about 200,000,000 pounds, or more than half the nation's cheese, it can readily be figured how the farmers are to be benefited by the ruling high prices for cheese which are raising the value of the farmer's milk. If the prices remain up, as many cheese dealers expect, it means that this spring the dairy farmers will get more for their product. When the cheese factories pay more it forces the city dealers and condenseries to raise their wholesale prices to meet competition and also gives the butter market an upward tendency. It will mean more money for new and better equipped barns; more silos; more automobiles; more equipment on the farms and better contented and more prosperous farmers.

A Strong Believer in Alfalfa.

JAMES B. CHEESMAN, of Racine county, is president of the Wisconsin Alfalfa Order and a student of live stock and feeding problems. He says the unusual economic conditions caused by the war in Europe have created an inviting and fascinating situation for every stockman. He believes that Europe's needs will continue to be greater as the years roll by and that the demands on the United States will increase heavily. He calls attention to the awful destruction of meat and dairy animals and to the corresponding decreased production of meat and milk. It is Mr. Cheesman's idea that there must soon be an enormous demand from Europe for a supply of field tools which have been destroyed. Farm tractors will be needed to hasten the work so long delayed by war's destruction.

The latest reports gathered do not indicate a very large increase in live stock in this country, and Mr. Cheesman says it remains to be seen whether he can do very much in the export business after the close of the war. If we cannot all find enough pure breds then we can do the next best thing and use good grades. First of all, we

must learn to feed well before we can mold and fashion animals to conform to the best type and style. The effect of judicious feeding, according to Mr. Cheesman, will go a long way toward producing desirable animals for breeding. And further, by an early use of well-selected, leafy alfalfa, the animal's stomach may be appreciably enlarged and its digestive capacity increased.

Mr. Cheesman regards alfalfa as the most profitable farm plant. He says a more liberal use of alfalfa will aid the Wisconsin farmer in preparing himself for better husbandry.

Celebrating the Community Spirit.

RICHLAND CENTER, Richland county, held a booster celebration on February 17th, 18th and 19th, which was one of the best examples of co-operation between business men and country folk that has come to the attention of The Wisconsin Farmer. The business men styled it "Get Together Week" and it was correctly so-called, for it seemed that every man, woman and child in the county visited Richland Center during those three days, and hundreds came from adjoining counties. They traveled by train, by auto, in bobsleds, cutters, wagons and even afoot, and it was in every sense a get-acquainted week for the merchants and the farmers.

After bringing the farmers and their families to town the merchants proceeded to entertain them. Merely getting them to town was not enough. They wished them to enjoy themselves, have a good time, and, if they had any money to spend, well and good. If not, it was just the same, because it was "Get Together Week," and the merchants realized the value of getting acquainted; of making the country folk feel at home so that they would have a warm spot in their hearts for Richland Center and then return later in the spring when they had some trading to do. The merchants wished the farmers to know that Richland Center wanted their trade, wanted them to come to town and was willing to co-operate with them to any extent which would increase the farmer's prosperity and make life more interesting, for the prosperity of the country merchant depends entirely upon the prosperity of the farmers.

Hundreds of dollars were given away in cash prizes and premiums for most everything—from the largest load of farmers that came to town to the largest number of automobiles from any one township. One of the editors of The Wisconsin Farmer was in the city on the first day, and the streets and stores were taxed to take care of the crowd, despite the fact that the roads were thawing and not in the best condition. The two succeeding days were much better and crowds were larger.

A grain show was held, for which $75 in cash was given away as prizes; general demonstrations of farm machinery, engines, automobiles, etc., were held; a baby show and a horse show were features of one afternooon. On the second evening a lecture on soil culture was given free by W. E. Taylor, of Moline, Ill. Among the entertainment features were dancing, style show and entertainment, roller skating exhibitions, etc., all in addition to the regular picture shows, etc. There was also held a dairy exhibit of Richland county butter and cheese for which $45 was given away as prizes. These were only a few of the hundred and one features of the week, and the prizes ranging from $50 down, which were given from the largest loads of visitors; those coming from great distances, etc., did much to swell the crowds.

Richland Center has found that this co-operation between merchants and country folk is a paying proposition. If it pays in Richland Center it will pay in any other town.

Handling Corn Land in Wisconsin.

THE United States Department of Agriculture has made surveys in twenty-one representative corn-growing regions for the purpose of studying farm practice in the cultivation of corn. In the central western division, or corn-belt territory, tillage methods were studied in a representative county in each of eight states. The land is level or gently rolling.

Heavy teams are employed for breaking and preparing the land; gang plows, two-horse check-row planters, and two-horse, six-shovel cultivators are generally used. Corn is usually planted level and in checks.

Using the data obtained as a basis for calculating the average farm practice in this division, it is found that 21.1 per cent of the farmers plow in the fall to an average depth of 6.1 inches, while 78.9 per cent plow in the spring to an average depth of 5.9 inches. The average depth of plowing for all divisions is 6.8 inches in the fall and 6 inches in the spring. The cultivations after plowing and before planting in this division average 2.9; the average after planting is 4.8. Corresponding averages for all areas studied are 2.3 and 4.6. The average normal yield per acre is forty-five bushels, as compared with 36.3 for all the regions studied.

One section of the report deals with a survey of Waushara county, Wisconsin. It was found that about half the corn land in this county is broken in the fall and half in the spring with two-horse and three-horse plows. Before planting, the land is harrowed twice, first with a disk and then with a spike-tooth harrow. About half the planting is done in checks 3½ feet apart each way, with two stalks to the hill, and about half is planted in drills 3½ feet apart with one stalk every ten or twelve inches in the drill. Most of the check planting is done with a two-horse, two-row planter, but some farmers plant by hand. After planting the field is gone over once with a spike-tooth harrow, and again with a weeder. Most of the cultivating is done with a two-horse, six-shovel cultivator. The two-horse, eight-shovel; the two-horse, ten-shovel, spring-tooth; and the five-shovel, one-horse cultivators are used by a few farmers. Corn land is plowed on the average to a depth of 5½ inches. After plowing and before planting, the average number of workings is 1.8, and after planting 5.4 workings are given. The average normal yield per acre is estimated at 30.4 bushels.

Clean Up the Hog Yards.

PRACTICALLY all hog diseases are due to germs. If all pathogenic—disease-producing germs, could be kept out of hog houses and hog yards we would have but very little disease to contend with among our hogs. Cholera, pneumonia, tuberculosis, swine plagues, and many other hog ailments are brought about through the action of germs and they cannot come into existence without the presence of the germs producing them. In other words, it is not possible, as many people think, for a person or one of the lower animals contracting a severe cold, to have the cold "run into" tuberculosis. If the germs of tuberculosis are not present there is absolutely no danger for a cold, no matter how severe, or any other disease for that matter, to end in tuberculosis, pneumonia or cholera. This is just as impossible as it is for iron to turn to stone.

We mention these things simply to impress upon those of our readers who may not fully understand the nature of germ diseases, just what sanitation means and what it may do toward preventing disease. Manifestly, if we can keep the germs of cholera or all other swine diseases away from our hogs we need not dread those diseases. It is true that keeping them away is not always an easy matter, because they may be carried to our farms in a great many ways; yet if we keep our hog lots clean, use disinfectants frequently, permit no standing water in the hog lots to become putrid, but keep everything well drained and as dry as possible, there is comparatively little danger of disease.

Clean out the lots as soon as weather conditions will permit, and don't allow manure to accumulate till farrowing time, when you will be too busy with other duties to clean up. Keep them clean right along. Use lime on the floors in the hog house. See to it that the troughs are kept clean and that the immediate surroundings are kept dry and sprinkled with lime or other disinfectant from time to time. If there are any low places in your lots that should be drained have this done as soon as possible, because low places, especially during wet seasons, are a menace to the health of the hogs.

Test Every Ear of Seed Corn.

IT IS not only important that seed corn be tested in Wisconsin this year but it is doubly important that every ear intended for planting be tested. The unfavorable season of 1915 not only caused a scarcity of good seed corn but many ears ripened that look all right, feel all right and appear to be good seed but which lack germination qualities. The Wisconsin corn grower cannot afford to take any chances this year even on the ear that looks good. It is impossible to tell with the eye whether a kernel will germinate. To be safe every ear which is to be planted should be tested.

As illustrating the need of testing we might refer to an incident at Madison, Farm and Home Week. A farmer who had several samples which looked like winners, was showing his seed. He was conscientious and believed his corn first class, but after a test of several ears which he made at the college it was found that the germination was less than 2 per cent. This farmer was greatly surprised and went home determined to make an ear test of all his seed. Unless others follow his example and test there will be considerable disappointment when the corn fails to show up at the proper time.

The Wisconsin Farmer is informed more testing is being done in Wisconsin this year than ever before. This is proof that the need is imperative, but there are always some who believe they can pick good seed with the eye. The aim should be to get 100 per cent corn. Eighty per cent is not good enough; neither is 90 per cent. Planting 80 per cent corn means the planter loses the equivalent of one row out of five.

Two tests must be given each ear—the eye test and the germination test. With the eye test the best candidates for the germination test are picked. The general maturity and vitality can usually be told by close inspection. But that is not enough, and to be certain make a germination test. Ears well filled out, kernels plump and sound, not chaffy, and firmly attached to a firm, well-colored cob are signs of quality in corn. Cobs which are damp and soft mean low vitality, and ears with kernels loose on the cob and weak in color should be rejected immediately without further testing. After the best ears have been chosen by the eye the germination test may be begun.

Don't give your seed a bulk test. That is, don't shell off the ears, mix all the corn together, and then pick out a few hundred kernels for the test. Test each ear separately before shelling. Take six kernels from each ear—two from near the top, two from near the butt, and two from near the center, and from different rows on the ear—so that the sample will represent the ear as completely as possible. Unless the six kernels all germinate and show vigorous sprouts, discard the ear from which they were taken. Aim to get 100 per cent seed corn. The better the seed, of course, the more perfect the stand, and the better the stand, other things being equal, the higher the yield will be. Even by exercising the greatest care in seed testing the loss due to imperfections in the stand will still be heavy enough, but that is no argument against planting the very best seed obtainable.

Now in regard to the amount of work, one man can easily test one bushel of seed corn in two hours or five bushels in ten hours; hence, in a day's time he can test enough corn to plant thirty acres, so the job is really a comparatively small one and especially so when it is done during the slack part of the season when perhaps nothing else could be done anyway.

If you haven't a tester buy one; if you don't feel like buying, make one. The testers on the market are very convenient and worth the money they cost. When people have the right kind of tools with which to do a job they can do better work than when they improvise something that may answer the purpose. This is why we think it is a good plan for the farmer to get one of the standard and reliable makes of seed testers.

Two Prominent Wisconsin Men Dead.

TWO prominent Wisconsin men, each one of whom had a special part in developing Wisconsin, have recently died. They are A. L. Hatch, of Sturgeon Bay, and Dr. Harry B. Favill, of Chicago, formerly a resident of Wisconsin. Mr. Hatch has been called the father of the cherry business in Door county. He had been intimately connected with the development of horticulture both in the Kickapoo Valley district and in the Door county peninsula. Dr. Harry B. Favill could not be called the father of the dairy business in Jefferson county, but his father and uncles, residents of that county, and two or three old settlers had a great part in developing the interest in Holstein cattle in the "greatest Holstein county in America." Sketches of both of these prominent men, and their pictures will be found in other columns of this issue.

The Rotting of Straw.

SOIL experts are diligent in season and out of season preaching the necessity and importance of conserving as much humus-making material as possible on every farm. Experiments conducted at the various stations indicate that many types of soil have an abundant supply of mineral constituents for crops if conditions could only be made favorable for their liberation. To this end great importance is attached to the matter of conserving the farm-yard manure, while even the cornstalks and all the straw produced on the farm should find its way back to the soil, according to those who have studied the matter.

In this connection we beg leave to refer to a communication received from a subscriber, Mr. S. P. Thomas, relating to the straw problem. Mr. Thomas writes:

> I would like to hear from you in regard to the best plan of rotting down a straw stack. The particular stack in question is close to the barn and I therefore cannot carry out the suggestion that some have made of adding lime to the straw in order to bring about its decomposition. I want to utilize this material on the soil but confess that it is difficult for me to decide what is the best method of getting this straw back onto the land. Possibly you or some of your readers can help me out on this point.

In former times the notion was quite strongly adhered to that straw must be rotted before applying it to the soil. We have known many instances where the daily custom prevailed of throwing a certain part of the stack into the yard, so that it could be tramped down by the cattle and hogs, later to be hauled to the fields in the form of manure. Indeed, there is much to recommend this method in the case of those who have live stock enough to utilize all the straw in this way, but we recognize the fact that there are thousands of instances in the corn belt where this plant cannot be followed. In such cases, it is entirely practicable to haul the straw directly to the field, scattering it thinly over the surface. Manufacturers have even recognized the need for providing some practical means of scattering dry straw and, as a result, machines are now on the market that efficiently perform this task. Those who do not have live stock enough to convert their straw into manure should remember the fact that the straw is worth saving. While it contains a relatively small proportion of fertility, yet its humus value is sufficient to justify the labor of transferring the straw from the yards to the field.

PLANNING FARM HOME GROUNDS.

Money Properly Expended on Farm Home Grounds Is Well Spent—By E. H. Niles, Oconomowoc, Wis.

THE American farmer, especially the Wisconsin farmer, if you please, is beginning to come into his own. He is receiving a larger proportion of the wealth his labor produces and with this increased prosperity he is letting up from the strain of subduing a continent long enough to consider the attractiveness of his surroundings. The natural result of this is the present wave of interest in the landscape work because no other form of decoration can be applied so naturally and so effectively to the farm home. He has plenty of out doors which is the main feature. He can get many of the materials near by and he has the training to give the proper care. The only part that worries him is how to proceed and to aid in this is the object of the following suggestions.

The general principles of landscape gardening apply to the country home as well as to any other. These general principles have been repeated so often they will not be dwelt upon here, but will be briefly outlined as follows: Open up and accentuate all the attractive views and screen unsightly ones; soften the harsh lines of the house and lessen the change from the natural to the artificial by planting at the angles; set off the house to the best advantage by making framework, that is, group the planting to the sides and the rear, leaving the lawn open, save for a few trees. The background should be as high or higher than the house with the sides decreasing in height to the front. Plant naturally, that is, avoid straight lines or geometrical figures, unless artificial conditions necessitate, or make excuse for them. Arrange the planting to bring out the special beauties of each season, from the crocus and snowdrops of early spring to the profusion of May with its lilacs and apple blossoms; from the gorgeous peonies and poppies to the soft purple and orange shades of late summer; from the rich coloring of foliage and fruits of the fall to the cheerful contrast of red, yellow and white bark with the snow-covered evergreens of winter. But in striving to obtain this do not forget that the most important of all is foliage.

One of the chief difficulties for the farmer is the time required for the care of the planting after it is in. For his city brother it is a rest to get out of the office or store in the evening and pull weeds among the flowers. But such rest does not appeal to the farmer who has worked in the field all day. He also seldom has watering facilities, but this is more than offset by his knowledge of the benefits of cultivation which the city man seldom has.

ALWAYS LEAVE THE LAWN OPEN, PLANTING THE SHRUBS AND PERENNIALS ALONG THE BORDER AND AGAINST THE HOUSE.

A VERY NEATLY ARRANGED FRUIT ORCHARD.

It is, therefore, necessary to cut down the labor item as much as possible. This can be done by reducing the lawn to definite limits, by keeping the planting in groups, leaving the lawn open and by selecting for the most part varieties that are fairly permanent and easily cared for.

By reducing the lawn to definite limits it is not meant that it should have a stone wall around it or a fence of any kind, but it is meant to do away with the usual strip of waste land that is neither lawn nor field. It is usually too full of ruts, weeds and mowing machines to be used for either. First, lay out as much lawn as you will be able to get along with conveniently; then lay out such drives and walks as are absolutely necessary and edge these up so that every user will know where he belongs and after this is done proceed to devote everything that is left to farming purposes. Almost all farm crops are attractive in themselves and a well-kept field may form an important part of the landscape. It is the waste patches that are unattractive and unprofitable and they form an unending source of weed seed and trouble. By having the drives well defined it will aid in preventing this, as the adjoining ground is not so likely to be cut up by ruts.

SCREENING AN UNSIGHTLY VIEW. NOTE THE STATELY LARKSPUR IN THE FOREGROUND.

In laying out the drive remember that it is meant for service, and, therefore make it as convenient as possible without cutting into the lawn more than is necessary, especially the front lawn. A curve is usually considered more graceful than a straight line, but remember that there is a difference between a curved drive and a crooked one. It is often more natural to drive in on a slight curve than a straight line, but if the straight drive seems the more natural make it so.

We are now ready for the grading. The house and barnyard should be well drained and there should be no catch holes on the grounds unless they are under drained. A gently rolling contour is to be desired and if you have secured these conditions in your building site it is well, as it is difficult to grade as gracefully as nature does and such work is expensive. In grading and excavating for the basement and drives save the top soil for the surface. After the general grade is done put in a heavy coat of manure and plow it under, or, better yet, if you care to take the time raise a crop of clover and turn it under with the manure.

We are now ready for the planting. Remember the first of the "general principles" as outlined above was to accentuate the best views and screen the unsightly ones. Naturally these should be considered from the points from which you will be the most likely to see them. Therefore, stand at the most important windows, doors and porches and lay out your view lines. If there is no window at your best viewpoint make one. Paintings are only imitations. Why hang them on your walls when you can cut a window and have a real picture? No house is properly planned unless the windows

A CORNER OF EVERGREENS, WELL LOCATED. A PLEASURE TO THE EYE THROUGHOUT THE YEAR.

OPEN LAWN BORDERED BY SHRUBS, AN IDEAL SETTING FOR THE FARM HOME.

The New REO "Six"

The 7-Passenger Fashion Plate of '16

YOU NEED GO NO FURTHER—you need pay no more—to obtain all the mechanical excellence, all the beauty, style, finish and luxurious riding qualities in a seven-passenger touring car, that your heart can desire.

FOR WE MAINTAIN that, though you search the world over, you will find no car at any price, that is the superior of this new Reo Six in these essentials.

MECHANICALLY IT HAS NO SUPERIOR—it is not possible to put better materials in a chassis, simply because the science of metallurgy knows no better. Reo uses and always has used the best. The fame of Reo rests on that.

IT IS NOT POSSIBLE to machine parts more accurately—for the Reo factories are admittedly the "Models" among automobile factories and Reo standards are admittedly of the highest.

AND IT ISN'T POSSIBLE to obtain an automobile, in the designing and fabrication of which more experience has been applied—for the Reo organization is the oldest in the Automobile industry. And never since the first Reo was made has there been a single change in the executive organization of Reo.

ALL WE'VE LEARNED, WE'VE KEPT right here in the Reo factories—and this latest product of Reo brains and experience and facilities is the net result.

AS TO BEAUTY OF EXTERIOR we need only say that when this new Reo Six was announced and its graceful lines shown in the engravings it was instantly hailed by everyone in the trade—rival and friend alike—as the "Fashion Plate" for the coming year.

AND IF YOU HAVE WATCHED closely the various new bodies that have since come out—some of them only too palpably redesigned to emulate the lines of this Reo Six—you have observed that it had set the style for the season.

BUT REO BEAUTY ISN'T on the outside alone—it's in the unseen places as well. In fact none so thoroughly appreciates Reo engineering as he who has studied it most intimately.

THE SAME STURDINESS—the same wonderful reliability, dependability and economy of upkeep—that have made the four-cylinder Reo world famous, are in this Reo Six.

"50 PER CENT OVER-SIZE in all vital parts," that Reo factor of safety is the reason at the same time for Reo dependability and low maintenance cost.

EVERY PART THAT IS SUBJECTED—or may ever be subjected—to excessive strains is made fifty per cent heavier—or of better material and therefore fifty per cent stronger—than other makers consider necessary. Motor parts—as crank-shafts, connecting rods, bearings—transmission gears, driving shafts, axles, differentials—all vital parts are made to the Reo standard "fifty per cent over-size."

SEE THIS NEW REO SIX. Ride in it. Drive it yourself—you can if you have ever driven any automobile. You will say you have never tasted the real joys of motoring before.

JUST A WORD ABOUT DELIVERIES. Those who know are unanimous in stating that there will be a tremendous shortage of automobiles the next few months. Can't be otherwise. Shortage of all kinds of materials and of tools to manufacture them—demand greater than ever before. Those who order early will get Reos—those who delay cannot hope to.

SO WE SUGGEST that you decide this matter at once and order your Reo immediately. Then you'll be one of "the lucky ones."

TODAY won't be a minute too soon.

For the Man Who Knows Cars

Wheel Base—126 inches.
Front Springs—Semi-elliptic.
Rear Springs—Cantilever.
Front Axle—I-beam.
Rear Axle—Full floating. Timken roller bearings throughout.
Tires—34" x 4½". Non-skids on rear. Demountable rims.
Motor—Vertical, six-cylinder, cast in threes. Valves protected.
Cylinder Dimensions—3 1/16" x 5⅛".
Horsepower—45.
Lubrication—Automatic force feed.
Carburetor—Automatic-heated.
Ignition—Generator and magneto.
Starter—Electric (Remy).
Transmission — Selective swinging type.
Single rod, center control.
Clutch—Multiple dry disc.
Brakes—Two on each rear wheel.
Steering — Gear and sector. 18" steering wheel.
Control—Left-hand drive, center control.
Spark and throttle on steering wheel. Foot accelerator.
Fenders—Drawn sheet steel.
Aluminum bound, linoleum covered running boards.
Gasoline capacity—18 gallons. Gasoline tank in rear.
Stewart vacuum system supply.
Gasoline gauge beside filler.
Body— Seven-passenger "Sheer-line" touring.
Genuine hand-buffed bright enamel finish leather upholstering.
Deep cushions and backs. Divided front seats.
Finish—Body, Golden Olive. Running gear, Black. Equipment nickel trimmed.
Thief-proof—Locking device. This enables the driver to lock simultaneously the starting device, the transmission and the floor boards. Starting device is made inoperative, at the same time that the transmission gears are locked in neutral position. It would take a volume to describe it—but you will see and appreciate it at a glance.
Equipment—Fully electric lighted throughout; improved 5-bow, one man, mohair top, with full side curtains; mohair slip cover; clear-vision, rain-vision, ventilating windshield; speedometer; electric horn; extra rim with improved tire brackets; power tire pump; jack; complete tool and tire outfit; foot rest.
Price—$1250, f. o. b. factory, Lansing, Michigan.

REO MOTOR CAR COMPANY LANSING, MICHIGAN

A Right Smart Harness—Built For Extra Wear

Built of the leather Europe now uses for artillery harness. Leather of natural color that can hide no imperfections. *Bark tanned*, does not crack—is not affected by sweat or rain. Scotch Knocker Harness is built for durability by expert harness workmen. It sets easily on your horses, and will stand an enormous amount of wear and tear.

Scotch Knocker Leather Collar

The collar that is built to conform to every bone, every muscle, every hollow spot, every swell in the neck and shoulders of the present-day farm horse. Horses have changed in recent years. Scotch Knocker Collars have changed with them. They fit. They assist your horse—they prevent, even *cure*, galled necks and shoulder sores. Made of *bark-tanned*, 7-oz. leather, triple reinforced where strain comes, stuffed with hand-flailed, long rye straw.

are located with reference to the views as far as practicable.

After the views are established arrange the groups of trees and shrubs between them. This will frame in the views and lead the eye in that direction. In other words, accentuate them. Unsightly views can often be shut out by these same groups. If the object to be screened is low use a group of shrubs, and a good view can often be obtainable over them. If it is high, for instance, a gravel pit in a distant hill, use high trees and possibly a good vista may be had beneath the branches.

The plan should now be considered from the road and other likely viewpoints, with reference to keeping the views open as much as possible from these points and to frame the house and grounds.

The planting directly around the house is governed by its style. Some require delicate lines, as are found in the eulalias and bridalwreaths; others strong formal lines as are found in the evergreens. Some require tall, pyramid forms and others low, drooping ones. For instance, a group of Lombardy poplars or red cedars by a low spreading house will make it appear all the lower, while with a tall house of long lines it will sometimes add the same architectural touch that a church steeple does to an otherwise plain building. However, this is something which must be decided with each house individually, as no set rules can be laid down. For instance some houses of the formal straight lines need graceful planting to offset this, while in other cases it is well to follow the formal idea throughout by using evergreens and other plants of the stiff formal outline. The heaviest planting should usually be at the corners and the blank spaces in the wall, because such features are not restful to the eye.

E. H. NILES, OCONOMOWOC, WIS.

The next problem is to decide on the choice of plants. It is necessary to consider many things in selecting the proper plant for each location. It is necessary to consider its height when mature, its breadth, its form, whether drooping or upright, formal or natural, its adaptability to the amount of light and moisture and to the character of the soil, the character of the foliage, the kind of fruit and many more points which come up when one gets into the work.

To do all this it is necessary to have plans, as no mind can carry all these details of arrangements for the entire place. It is better and more economical in the end to have experienced help. But to one who wants the satisfaction of planning his own home these results are not impossible and we will attempt to outline the actual steps necessary to accomplish them. Three suggestions will be given. First, do not plant too much. It is a common fault to plant trees and shrubs much too close. You often hear the remark that the trees were planted with the idea of cutting out every other one when they became crowded, but I do not recall one instance where they were taken out until they had caused irreparable damage. A perfect tree is a rarity on our streets, largely for this reason. The same fault is just as often found in planting shrubs, although it is not so serious, as shrubs can be more easily transplanted when they get to crowding, although even this is seldom done. From thirty to forty feet is none too wide for trees and four to six feet for the larger shrubs, as lilacs, honeysuckles, etc. Second, do not be too impatient and skip all the slow-growing varieties, as often, in fact, as a rule, they are the most permanent. Contrast, for instance, the soft maple, box elder and the poplar with the sugar maple, elm and oak or the Balsam fir with the white spruce. Neither is size a gauge for value. A Japanese yew (taxus cuspidata brevifolia) two feet high is more valuable than a black spruce ten feet high. Third, do not think that just because a tree grows wild in the woods it is not as good as some variety imported from Europe. With few exceptions the native variety does better with us than the European variety of the same species. For instance, the American white elm does better than any European elm I have ever seen. The same is true of the American white birch and the American linden and others. The Norway maple seems to be an exception, although in some respects it is not as good as either the native sugar maple or acer rubra, sometimes called the swamp maple. In the evergreen family no country has produced a finer evergreen than the native hemlock spruce and the white pine is one of the finest pines. The Canadian yew of our northern woods does not seem to be as good as the Jananese yew, although neither of them has been tried enough. The Wisconsin woods and meadows also contain hundreds of varieties of ornamental shrubs and flowers, but it is too large a subject to even touch upon at this time.

While it is well to use many of these native varieties it is not wise nor economical to collect them, as the plants will not be as good and will not grow as well as nursery-grown stock.

Of course, there are hundreds of desirable varieties not native of Wisconsin, but stress is here laid upon the native varieties because they have been neglected?

These are the three most common errors, and by avoiding them it will save labor also, because a surplus of trees and shrubs, fast growing, short-lived ones, or plants which die because they are not adapted to the climate, all add to the work.

Just a word in closing on the use of evergreens. They have been put into bad repute, to some extent, because they were wrongly used. The larger growing ones should seldom be used in the front yard, as they obstruct the view, and their beauty is disfigured if they are trimmed from the bottom. If in the background or at the sides where no view is obstructed a group is very appropriate, especially if it can be placed to the north or west of the house. The dwarf varieties can be used in the front or near the house the same as shrubs, and should be used more. The best of these dwarf and semi-dwarf varieties for Wisconsin are pinus mugho, pinus cember, juniperus prostrata, juniperus pfitxeriana, juniuerus scotti, taxus cuspidata, taxus canadensis, thuya wareana, thuya globosa, thuya pyramidalis and thuya elwangeri.

It is hardly necessary to go into the manner of planting and the care of the plants, as the average farmer understands that, but it might be well to add that such work, if properly laid out, is not especially expensive to install or care for, and will increase in value as the years go by, and at the same time be a source of education, of health and of general satisfaction to the farmer and his family.

Silos That Last For Generations.

THE Equitable Life Assurance Co.'s new office building in New York City, the largest insurance building in the world, is fire proofed with "Natco" hollow tile. A picture of it is shown in the "Natco" advertisement on page 23. What is best for city construction is also best for farm construction. Natco silos will last for generations and the dead air spaces keep the ensilage sweet, because of their perfect protection against cold weather. There are many other uses for "Natco" tile in farm construction fully and interestingly described in their book "Natco on the Farm," which will be sent you free, together with their Natco Imperishable Silo catalog, if you will address National Fire Proofing Co., 1123 Fulton Building, Pittsburgh, Pa., and mention this paper.—Adv.

NOW! A Combination Plowing and Threshing Outfit—

Any Size You Want

THERE are five sizes of Avery Combination Plowing and Threshing Outfits—a small 8-16 H. P. Tractor, 3 bottom Plow and 19x30 inch Thresher up to a large 40-80 H. P. Tractor, 10 bottom Plow and 42 x 70 inch Thresher.

There's a size Avery Plow Outfit for any size farm and a size Avery Thresher for any size run.

Avery Tractors deliver strong traction power for plowing and steady belt power for threshing. Avery Plows are original patented "Self-Lift." There are more acres plowed by Avery Tractors and Plows than by any other make. Avery Threshers have made the best proven grain saving records. Average in 27 tests was 99 9-10 per cent.

Get a complete Plowing and Threshing Outfit built and backed by one company. Large factory and many branch houses insure prompt and permanent service. Write now for new 1916 complete Avery Catalog. Address

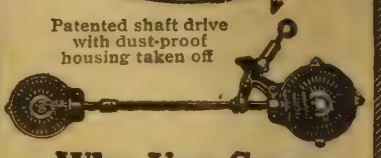
Patented shaft drive with dust-proof housing taken off



Why You Save Work and Money with the Shaft Drive

HERE you see a top view of the Janesville corn planter. Note the freedom from needless parts. The construction is simple—easy to handle—easy to take care of.

In using the shaft drive we reduce the number of operating parts generally needed on a corn planter. We discard the clutch—we free you from chains, sprockets, springs and possibilities for gumming up, breakages and needless repair bills. We assure you of having your planter in running shape all of the time. You are not held up waiting to replace broken parts.

Instead of giving your planter a kerosene bath at every round, you grease this shaft drive once a season. Any part showing a flaw in material will be replaced free of charge during life of machine.

Why not save work and worry this year and for many years to come by getting a

JANESVILLE CORN PLANTER

The Only One With The Shaft Drive

Here is another feature that you will like on this planter. It has a sight feed. You can see every hill as it drops. You can change the feed without stopping the team—drop two, three or four kernels to the hill as the soil will stand. Here's the best construction for handling silage corn.

You can provide for any quantity of seed corn per acre. Commercial fertilizer attachment, as well as cow pea attachment also, can be furnished.

80 rods of wire, a reel, a disc marker, a full set of edge drop as well as flat drop plates for checking or drilling, furnished with each machine. Made in following models: checking and drilling, drilling only and lister planter.

Flowers Suitable for Farm Home.

Every Woman, at Small Expense, Can Have Shrubs and the Perennial Flowers—By Miss E. M. Goelzer, Oakwood, Wis.

THE planting of shrubs and flowers is a matter to be considered by everyone who wishes to complete the picturesqueness of the country home. For shrubs and flowers form an important factor in the adornment of the home surroundings.

There is such a multitude of hardy shrubs and flowers that no one ought to be at a loss in selecting a few that are attractive in appearance and useful as cut flowers. The hardy shrubs when once planted and given reasonable care will grow almost indefinitely. Plant them in convenient places. If not in front of the house then plant them in places where they may screen unsightly spots and grow just as easily as the burdocks and other weeds.

Of the hardy schubs the common lilac, an old-fashioned shrub, deserves a place in every garden. The beautiful purple flowers, with their tender fragrance, are beloved by everyone. They will grow almost anywhere, but good soil and a sunny location will produce better flowers. Trimming out the withered flowers will greatly improve the appearance of the shrub during the remainder of summer.

Another favorite shrub is the snowball. It is very hardy and its lovely white balls of bloom are a beauty to behold.

Of the Spireas the most beautiful one is the Spirea Van Houttei. It is a beautiful ornament for the lawn at any season and when in flower it is a complete fountain of white bloom.

The rose designated as the "Queen of Flowers," should be foremost of all the shrubs. No garden should be without them. It is the most appreciated flower and well deserves its rank.

The hybrid perpetuals are the most desirable. They are classed as entirely hardy, but some protection during the winter is quite beneficial, as the constant freezing and thawing injures the bushes.

The hybrid tea roses are among the most beautiful of all. They produce an abundance of flowers from early summer until freezing weather. For continuous flowering it is necessary to have healthy and vigorous plants, and so we must constantly battle against the ravages of insect pests and diseases. Spraying once a week with a Bordeaux arsenate of lead mixture will keep them free from almost all insect pests as well as fungous diseases, but sometimes it is necessary to use either a tobacco or whale oil soap solution for the aphis.

The hybrid tea roses are not hardy and even with good protection will not withstand our winters. It is best to take them up and plant in boxes and place in a cool cellar and giving just enough water to prevent the soil from getting too dry.

Of the hardy climbing vines the large-flowering clematis is the most attractive. When in bloom no other plant equals it in beauty. They are very hardy, but it is best to take the vines down and cover with a liberal mulching of strawy manure.

Of all the plants that are planted for ornamental purposes there are none that have attained such popularity as the hardy perennials. Their popularity is not at all surprising when we note the many changes that take place throughout the growing season in a hardy border, as almost every day brings something new to interest and delight. When once established they give us great rewards for slight labors, but do not, however, imagine that hardy perennials need no attention. They need good cultivation in spring and some must be protected in winter.

The early-flowering ones grow very rapidly and one of the first to bloom is the bleeding-heart. Its long racemes of graceful, pink, heart-shaped flowers are very attractive, its only objection being that soon after the flowers have faded the foliage will ripen and leave a dormant spot.

We next will have the columbines. They come in various colors and are very pretty as cut flowers. They succeed in any soil and location and plants often come up from self-sown seeds and are easily transplanted.

The ever popular peony is considered the "Queen of Spring Flowers." They are of rather slow growth when first planted, but when well established will increase in size each year. They are unequaled for their brilliant colors and abundance of bloom. They require a deep, rich soil and thrive in a partly shaded as well as in a sunny location and are very hardy, but a good mulching of manure will retard the early growth in spring and thus prevent them from being injured by late frosts.

The delphiniums or hardy larkspurs with their long, showy spikes of flowers, ranging through all the colors of blue from beautiful sky blue to purple, are much admired. They are of easy culture and may be raised from seed and many of the plants will blossom the first season. After the first crop of flowers have faded cut off the flower stalks to within a few inches above the ground and new shoots will come up and produce a second crop of flowers. A good plan is to stake the plants when about three feet high, as the stalks are very tender and easily broken by the wind.

The hardy gaillardia is one of our showiest perennial plants. It blooms the entire summer and its large, gorgeous-colored flowers are a bright, golden yellow and reddish brown, going into all imaginable tints and shades. They are easily grown from seed and do well in any good soil, but want a sunny location.

The perennial phlox is one of our prettiest summer flowering plants. They have such a wide range of colors and when once planted do not need attention for several years. They succeed in any good soil, but a mulch of manure every season is of benefit to the plants. If the flower spikes are cut off as soon as faded a second crop of flowers may be had until late in the fall if plants are given sufficient moisture.

There are many more hardy perennial plants that are equally beautiful and attractive, but coming on to midsummer we want the annual flowers for beautiful colors and profusion of bloom. There are so many beautiful kinds that no garden should be without them. As cut flowers for decorative purposes they are the most desirable.

The seed of the annuals must be sown each year and of many of them it is best to start the seed early indoors in shallow boxes or in a cold frame. I do not prefer a hotbed, as the plants grow too frail and tender and will not grow well when transplanted.

Many people do not have available space for flower beds, so a good way is to plant them in the vegetable garden, which usually consists of rich soil and is suitably located. Do not plant in beds, but put in rows as the vegetables, so they may be cultivated and kept free from weeds.

I will mention a few of the annuals that are easy to grow, have a wide range of colors and continue in bloom until taken by the frost.

One of the earliest flowering annuals which for beautiful fragrant flowers is excelled by none is the ten-weeks stock. The colors range from the deepest reds and purples to the most delicate pink and lavender and white, and as cut flowers they are very lasting.

For brilliant colors we will have the giant-flowering snapdragon or antimhinums. They grow well in any soil, but need a sunny location and a warm temperature, as in cool weather the flowers are not abundant.

Another very pretty flower is the sweet sultan or centaurea. It is seldom grown in the ordinary garden. Its artistic shaped flowers are borne on

(Concluded on page 12.)

You Want Power and Long Life.

KisselKars are manufactured cars—built under one roof.

Kissel-built motors are well known for their reliable power and full economy.

As good an axle can't be found in any car, anywhere, at any price.

Other features just as distinctive all the way down the line.

WHETHER or not you care to drive your KisselKar 100,000 miles, it certainly speaks well for it that others have driven theirs that distance.

You feel that a car that has pulled through such mileage must be right—the materials must be right—every feature well worked out.

KISSELKAR
Every Inch a Car

One of the best KisselKar models ever turned out is the High Efficiency 32-Four at $1050. You ought to see it before you decide to buy.

Write for full details and nearest KisselKar dealer.

THE FARMER'S FRUIT GARDEN

How to Get the Best Out of the Fruit Patch—By C. L. Richardson, an Experienced Grower, of Eau Claire, Wis.

RESULT OF PROPER SPRAYING AND PRUNING.

THE farm garden is a project which almost everyone has idealized to suit his particular tastes and circumstances. But as it is at best only an attractive side line, dwelling as near as may be in peace and amity with the drove of swine, the herd of cattle, the corn, the grain and the hay, so this garden must be a very practical affair after all; simple, productive, inexpensive, easy to care for, and, above all, dependable and scattering its fruits over a long stretch of time.

This combined orchard and garden should be of considerable extent—from one-fourth to three-fourths of an acre we will say. Its length will be much more than its breadth to secure easy cultivation, with clear turning space at the ends and free clearance at the sides. The soil should be fertile and in good tilth. Its location is usually dictated by convenience and location of buildings. Nevertheless, if any choice be possible a northeast is preferable to a southwest slope, or in lieu of that secure as much protection as possible from fences, windbreaks, buildings, etc., from the icy blasts of the northwest in winter and the intensely hot southwest simoon of August. The importance of this winter and summer protection is not sufficiently realized by those whose farms happen to lie in exposed situations.

The trees should be arranged in rows the long way of the plot, preferably north and south. In the absence of local conditions to the contrary the plums, being hardier, are placed west of the apples. The currant and gooseberry bushes may be planted between the trees in the row, while the strawberries and raspberries may be planted in rows between the rows of trees.

Depending upon the soil and its adaptability to apples, as well as the distance north and west in the state, from a dozen to thirty apple trees will be required. Throughout the southern and central section the list would be somewhat as follows: One each of Yellow Transparent and Wolf River, two each of Duchess, McMahon, Hibernal, McIntosh, Patten's Greening and Fameuse, four each of Wealthy, Dudley and Northwestern Greening. To these I might add Scott's Winter, Anisim, Talman Sweet for baking and the Gideon for its superb sauce. Along the southern Michigan lake shore a dozen of the poorest of these might be replaced by the King, Baldwin, etc.

Do not crowd the trees. Twenty by twenty-four feet is close enough for apples and eighteen or twenty feet for the plums. This gives room to plant two gooseberry bushes, three currants or a grapevine or two between trees.

There are a number of good currants on the market, perhaps the Perfection and Fay's Prolific are as good as any. Keep them clear of the trees as they require a high degree of fertilization. Until the trees become too large to permit, cultivate in early spring and summer, mulch or manure heavily about the bush, remove about one-fourth of the old wood each year and when you cannot cultivate longer mulch with sawdust or the chip dirt from the wood piles. For the currant worm dissolve half a teaspoonful of white hellebore or three times that amount of London purple in a sprinkling can and apply once or twice.

HANDY FOR THE HOUSEWIFE.

A GENEROUS YIELD.

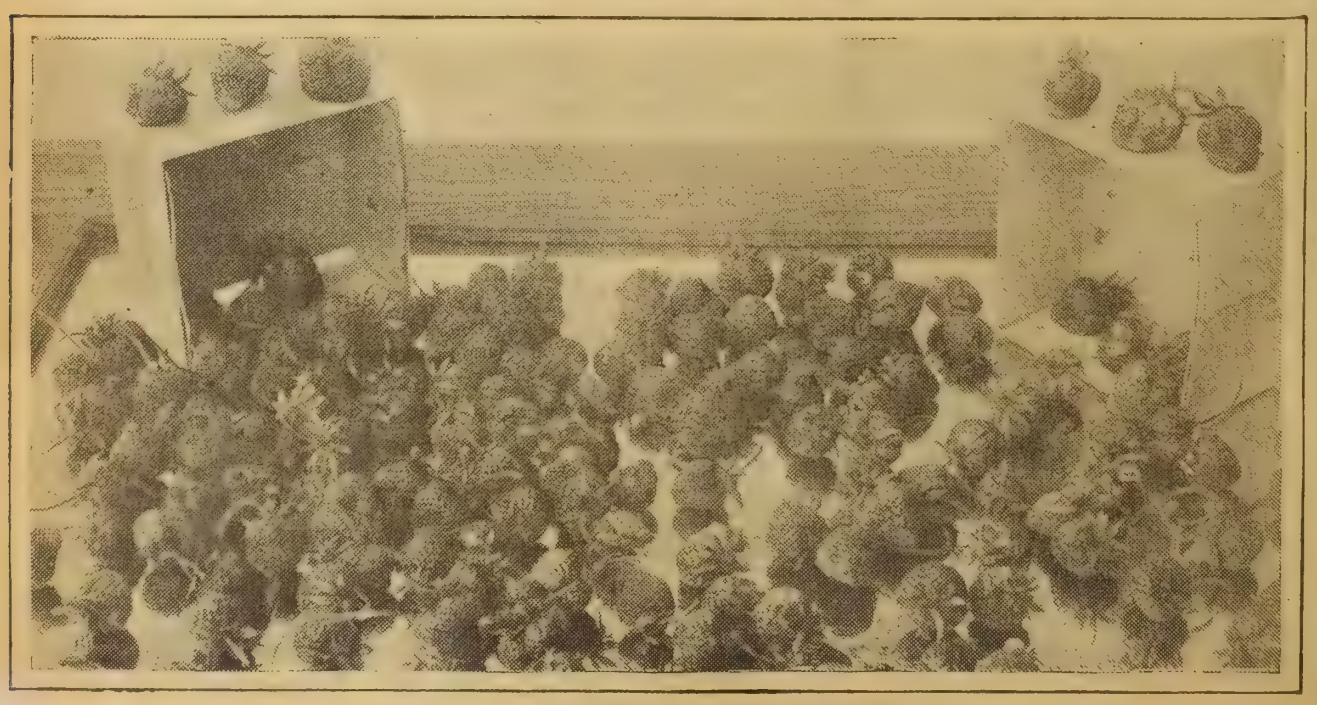
The plum succeeds over a greater diversity of soils than the apple. it fills in a gap and the fruit is excellent raw, preserved or canned. Ten to fifteen trees may profitably be planted, including three or four Surprise and one or two each of such standards as De Soto, Wyant, Wolf, Forest Garden. Terry, Quaker and others. For best results they should be trimmed back each year to balance and to remove excess bloom, should be mulched to retard spring blossoming, retain moisture and increase the size, should be cultivated if possible for the same reason and should be sprayed with Bordeaux mixture and arsenate of lead for fungous diseases and curculio. They all have too much of a tendency to go back to the condition of their uncivilized parents. To this list I would add two trees each of several of the Hansen Hybrids, including the Sapa, Opata, Hanska, Kaga and possibly one or two more. They fruit extraordinarily young, fill in vacancies in the fruiting season and are pleasing and attractive as far as I have seen.

There is a strip in eastern Wisconsin where the farmer will find it profitable to plant cherry trees, but so far they have not proved a fruiting success beyond narrow limits.

About 200 raspberry canes is the next consideration. Almost every year sees new introductions, but my choice would still be the old, time-tried Marlboro, Cuthbert and Loudon. The purple Columbian is good also. They should be planted in the early spring in rows six to eight feet apart and three to four feet apart in the row. As fast as possible develop a solid hedge row with paths separating it from the next. It will be necessary to lay them down and cover with earth for two or three years until well established, after which they may be left exposed over winter, and after some winter killing they will become acclimated and fruit pretty regularly. The size may be improved by cultivating out the paths and removing the old wood each August. I am aware this is unorthodox treatment, but it is one way to secure fruit on the farm. How many farmers will continue to grow a cane that must be laid in the grave each fall in the haste of plowing to be exhumed again in the rush of spring seeding?

The strawberry bed is of first importance. Five hundred plants is not too many for the average farm. There will be room for two or three rows between the apple trees if set four feet apart. Set twenty inches to two feet apart in the row and as early in the spring as convenient. Let the extra earlies, the extra lates and the freaks alone. One hundred Progressive (everbearing) will be a wise investment—they will produce the first berries in the spring and if the season is reasonably wet a fair second crop in August and September. The Dunlap will succeed anywhere in Wisconsin, is perfect flowered, hence can be planted alone, and is very hardy and productive. If several varieties are desired add the Warfield or Haverland for mid-season, and the Sample, New York, Uncle Jim, Glen Mary or one of the other large, late varieties.

Cultivate once in two weeks or oftener until August and not so often after that. Hoe them four or five times during the spring and summer, swinging the runners about longitudinally to form a row one to two feet wide. Keep the blossoms cut off until



NOT LONG TO WAIT FOR THIS MONEY-MAKING CROP

July to throw all the vitality into the runners. Keep the alley free from plants and in a fine state of cultivation. Before the snow covers the rows out of sight they should be mulched with straw, marsh hay or strawy stable litter one to two inches in thickness. This prevents thawing and freezing, retards the weeds next spring, conserves moisture and keeps the fruit from lying in the dirt. This bed will furnish fruit for two years at least, but each spring a new bed should be set out from the new plants which have never borne fruit, as old fruiting plants are not satisfactory. After the bed has fruited the alley can be plowed lightly, dragged down and made ready for the rooting of new runners from the old row alongside. Sometimes it is possible to carry a patch over four years. By moving the bed about in the orchard and beside it the orchard and garden may be kept together for a long period of time if desired. To avoid continual replanting on the same ground rotate with potatoes, garden vegetables and even oats and clover. Clover hullings make excellent mulch for trees, but contain too much grass seed for use on the strawberries.

Before the ground freezes it is well to examine the trees and if any are loose in the ground tamp the soil firmly about and remove any grass which touches the trunk, as it makes a tempting home for the mice, which I find more destructive than the rabbit. Wrap a piece of tarred paper or building paper about the trunk of the tree reaching from the ground to or even above the lower limbs, and tie with a bit of tarred twine. This is a protection from mice, rabbits and sunscald. A large bundle of cornstalks makes a higher protection and seems to be more efficient, especially on loam or sandy soils.

Black raspberries require the same general treatment as the reds except that they prefer richer land, more moisture and more mulch than the other. We have found the Cumberland, Gregg and Older satisfactory.

Very difficult to raise and not advocated for the average farmer is the blackberry. Where it succeeds at all it prefers heavy, black soil, very fertile and very wet. The Ancient Briton and Snyder are reliable as any. All over central and northern Wisconsin the wild blackberry grows profusely, and almost any farmer as he clears up the woodlot may get a few vines started in the new clearings, and for the next five or six years while the stumps are rotting down he may have a very fair supply of blackberries. Coming before the apples and after the other small fruits they fill the vacancy quite satisfactorily.

Let us summarize and see what the owner may look forward to in time to come under favorable conditions. In August and September of the first year the everbearing strawberries will produce a few berries if the year is fairly wet. The next year the strawberries and raspberries come into fruit and three of Hansen's Hybrids. The Americana plums will bear at three years and the first apples at four. So that at the fifth year the strawberries will commence from the 5th to the 20th of June and continue for three weeks at least. By the time they are gone the raspberries come on and carry the family along a fortnight or more. By that time the Sapa and Opata plums will be ripe and blackberries coming on. Before they are gone the native plums and the remaining hybrids get into the fray and before the last of these are eaten the Charlamoff Duchess and Yellow Transparent are here. Once the apples arrive the list given above will take care of the average farm family until the last Northwestern Greening is gone—but not forgotten—in May of the ensuing year. Of course, the family have eaten canned and preserved fruit all fall and winter. From May to June the poor average farmer will be obliged to eat pieplant and asparagus, starve and possess his soul in what patience he may until the strawberries arrive once more.

Perhaps this looks like a seriously large contract, but it is all possible, all practical and can be done on any farm in Wisconsin where the first outlay can be made, the small amount of time afforded that the fruit requires, and where conditions permit apple trees to grow. In the far North and where the soil is unfavorable the farmer may still try the Duchess, Patten's Greening, Virginia crab and Hibernal—some of these will grow on almost every farm if well cared for. So this is the opportunity for the family that will try.

GROWTH OF WISCONSIN LAND VALUES.

The growth of land values in Wisconsin districted by counties is traced in a report based on land sales compiled by the state tax commission. Land has increased in value $33.75 an acre in 1905 to $55.25 in 1915. It shows the value per acre from 1905 to 1915 by counties as follows:

	1905	1910	1915
Adams	$ 13.00	$ 16.00	$ 22.50
Ashland	9.25	14.25	19.75
Barron	23.00	32.50	46.00
Bayfield	11.25	13.00	15.50
Brown	63.00	77.75	92.50
Buffalo	27.00	29.50	43.75
Burnett	10.50	11.50	17.25
Calumet	80.75	98.50	134.50
Chippewa	23.00	28.00	39.75
Clark	26.00	30.75	43.25
Columbia	52.00	61.75	76.75
Crawford	20.75	26.50	41.75

Wood	29.25	35.75	39.75
State	$33.75	$49.25	$55.25

In 1915 the estimated average value per acre in fifteen counties is less than $25; in twenty-three counties between $25 and $50; in eight counties between $50 and $75; in eight counties between $75 and $100 and in seventeen counties over $100.

PRACTICAL STUDY OF THE PIG RATION.

On October 23, 1915, two pigs which averaged 10 pounds each, were purchased and sold to the boys of the seventh and eighth grades of the Gays Mills public schools on equal share at $1 each. These pigs were just ordinary pigs of no particular breed, and although they were bought at the local stockyards, yet they were not fat, but rather in the best of running condition. For a time their daily ration consisted of buttermilk and table scraps; later a mixture of ground feed was added; and still later corn was included. A mixture of charcoal, wood ashes and salt was kept before them all the time.

The pigs were sold on January 27th, having been fed ninety-six days. It was found that they had made an average daily gain of better than one and a half pounds each, the total weight of the two being 510 pounds. They were bought at $6.50 per hundred pounds and sold at $6.75 per hundred pounds. Hence the profit to pupils on each dollar invested amounted to 98 cents.

However, mention must not be neglected of the fact that through the kindness of a neighbor a small field of corn was given to the boys for the husking of it, otherwise the financial side of the story would not look so well in print. However, the chief object of the experiment was not so much for any financial gain which it might bring, but rather for the purpose of arousing a great interest in agricultural work by giving the pupils an opportunity to deal with the real problem instead of the abstract.

No carnivorous bird or quadruped in England will eat the flesh of a cat. The rule applies even to the carrion crow, which will devour dead dogs greedily.

In and Around Wisconsin

The importance of the dairy industry in Richland county is indicated by the recent shipment from Richland Center of fifteen carloads of cheese, worth $70,000, to the London, England, market and the contracting of five additional carloads which will be shipped shortly.

Farmers in central Wisconsin, especially in Clark, Wood and Marathon counties, are fostering a movement to organize a cheese producers' federation along the lines of the Sheyboygan County Cheese Producers' Association. A meeting is to be held soon to discuss plans for organization.

M. B. Rosenberry, of Wausau, who was recently appointed a member of the state supreme court, has been active in agricultural affairs for many years in Marathon county and is president of the Farmers' Co-operative Packing Company, of Wausau, whose plant began operations about two months ago.

The Stevens Point Fair Association recently completed plans for the 1916 Portage county fair which it is proposed to make the best ever held. Several improvements are planned and a new system of cooping will be installed for the poultry exhibitors. I. S. Hull was chosen president; E. H. Rothman, vice president; J. M. Pfiffner, secretary; C. S. Orthman, treasurer.

Reports recently issued by the new Farmers' Co-operative Packing Company at Wausau show that in the first two months of operation the plant handled about 500,000 pounds of live stock of which 35 carloads were purchased outside the city of Wausau. For this stock a total of $43,110.02 was paid of which the railroads for freight received only $697.23. The plant during that period sold and delivered 104,108 pounds of meat; 9,560 pounds of sausage and 17,510 pounds of lard.

The Inter-Township Fair Association has chosen September 19th-21st as the dates for the 1916 fair at Oconto. At the 1915 fair $1,115 was paid out in premiums and the indebtedness on buildings was reduced, leaving a small balance in the treasury. W. C. Riner, Eldred Klauser, T. F. Reynolds, John H. Berger, W. A. Flatley, Theodore Eastman and J. D. Amgus were chosen directors. Mr. Klauser was also elected president; Mr. Berger and Mr. Riner, vice presidents; Mr. Reynolds, treasurer and A. J. Peterson, secretary.

The Watertown Inter-County Fair Association at its recent annual meeting elected the following officers:

President—Emil Tanck, Watertown.
Vice President—H. J. Grell, Johnson Creek.
Secretary—Charles W. Harte, Watertown.
Treasurer—Charles E. Frey, Watertown.
Superintendent of Speed—Charles Mulberger, Watertown.
Directors—W. A. Beurhaus, Watertown; Emil Klentz, Reeseville; H. W. Kronitz, Watertown.
Soliciting Committee—C. A. Kading, Max G. Kusel and John C. Gruel, all of Watertown.
Publicity Committee—J. P. Holland, Otto Krueger and John M. Moore, all of Watertown.

FLOWERS SUITABLE FOR FARM HOME.

(Continued from page 9.)

long, stiff stems and are well adapted for cut flowers. The colors are mostly white, lavender, purple and yellow.

Another good annual is the larkspur. They have been vastly improved in recent years in size and color of the blossoms. They are continuous bloomers, even after the frost has taken all the other flowers the larkspurs are still bright. The larkspurs do best if the seed is sown where the plants are to bloom, as they do not transplant successfully. The seeds take a long time to germinate and if sown in the open ground without special care very little will come up. A good way is to open little furrows in well-pulverized soil, water thoroughly and then sow in the seeds and cover with fine soil. Then cover the rows with folded newspapers held in place with weights or stakes. If the weather is not at all too hot and dry there will be sufficient moisture for the plants to come up. Remove the papers when the plants begin to appear.

With the advent of cooler weather we will be looking for the beautiful aster. There is no flower that has such a diversity of colors and species as the aster. The aster is of easy culture, but I have found no flower so subject to insect pests and plant diseases as the aster. Among the insects that I have encountered are the root lice or aphis, the flea beetle, the black aster beetle and the tarnished plant bug, and among the diseases stem rot and yellows.

The pansy should be included in every flower garden, for no flower is more interesting to grow, as each opening bud is watched with interest for different colors and markings. Pansies are not difficult to grow. They demand a rich, loamy soil, somewhat sandy, and an abundance of moisture. For strong, vigorous plants and large flowers the seed should be sown early and when the plants have about four leaves transplant into beds that have been prepared in the fall by digging in well-rotted manure and in spring again dug over to make the soil thoroughly loose and fine. Partly shaded during the hottest part of the day would be an advantage and during very dry weather the bed should be thoroughly watered, preferably in the evening, and in the morning the soil should be stirred up and made fine to prevent the forming of a crust, but care should be taken to prevent injury to the roots. If the plants are to be continuous bloomers all withered flowers and seed pods must be removed.

Another addition to our list of beautiful flowers are the sweet peas. A more beautiful sight than a well-grown ro of sweet peas in full bloom cannot be imagined. Their culture differs somewhat from the other flowers, for sweet peas must be planted as early in spring as the ground can be worked. Good soil thoroughly mixed with well-rotted manure and wood ashes dug to a depth of one foot give splendid results. Sow the seeds in a trench about six inches deep and cover with an inch of fine soil. After the plants are up gradually fill the trench to the level of the surrounding ground. It is necessary that the surface of the soil be kept mellow all the time. They should be staked up with brush or wire netting and in dry weather watered thoroughly and frequently. The flowers should be cut as soon as open, for the forming of seed pods will stop the plants from continuous blooming.

No use cutting a lot of holes and burdening your basement with a lot of cumbersome warm air pipes when the Caloric Pipeless Furnace heats all rooms with only one register—and 35% less fuel.

The installation is simple. It is just as easy to put the Caloric Furnace in an old house as in a new one.

PIPELESS CALORIC FURNACE

Burns Coal, Coke or Wood.

It brings city comfort to the Farm Home. Lessens fire danger to house and children. Saves labor of carrying fuel and ashes up and downstairs. It is the one furnace that will not spoil the produce in your basement.

It is Fully Guaranteed

Fairest offer ever made. If the Caloric Furnace is not entirely satisfactory we'll make it so any time within 1 year.

MAKE THEM WATERPROOF WHILE YOU'RE AT IT

Concrete is good, but *waterproofed* concrete is better. Especially if you're building a feed-floor, a silo, or a concrete trough, these for sanitary as well as other reasons should *be* waterproof and *stay* waterproof—always. Two per cent. of

Medusa Waterproofing

in either paste or powder form, added to the mix, makes your concrete absolutely *watertight* without affecting its strength, setting or hardening qualities. Or if you want to save the trouble of mixing we supply

Medusa Waterproofed Portland Cement
(*Gray or White*)

in which the correct proportions of Medusa Waterproofing and Medusa Gray or White Portland are scientifically ground together in the process of manufacture.

In an ordinary mixture, use the same amount of Medusa Waterproofed Portland Cement as you would of Medusa Gray or Medusa White without the waterproofing.

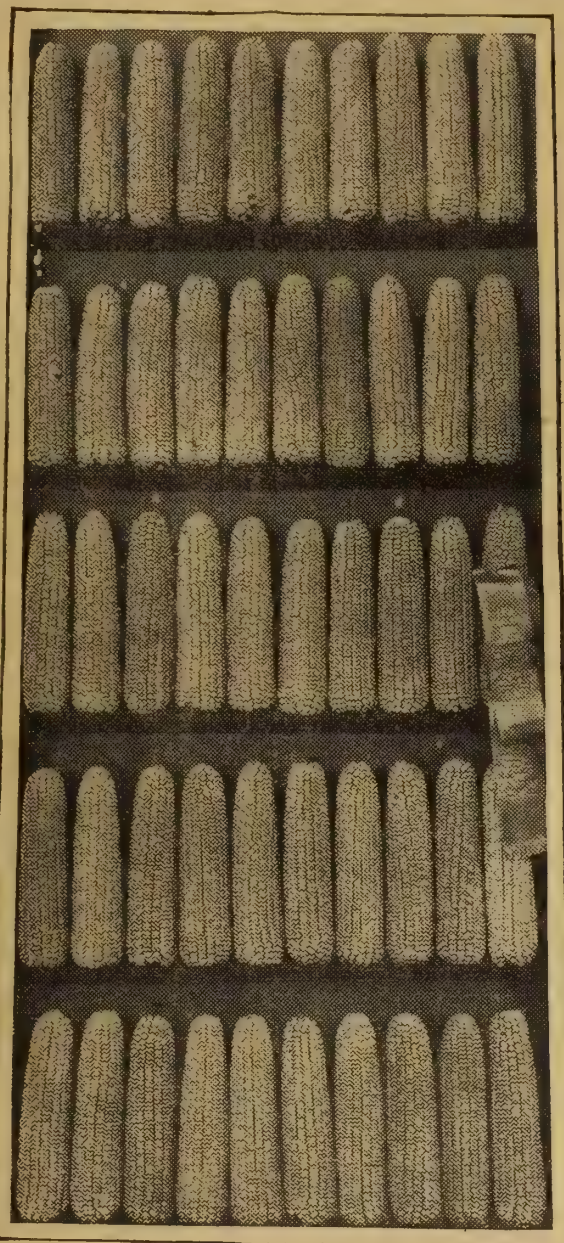
Champion Yellow Dent Corn.

THE WISCONSIN FARMER reported in its issue of February 17th that S. P. Markle, of La Crosse county, a member of the Wisconsin Agricultural Experiment Association, had won The Wisconsin Farmer cup at the annual grain show held in Madison. This cup was offered for the best fifty ears of Wisconsin-grown White Dent corn, and Mr. Markle, we believe, richly merited the coveted prize. The illustration given herewith shows Mr. Markle's exhibit, and every good corn grower will admit that these fifty ears are a very fine illustration of what the Wisconsin grower can do by using pure-bred seed corn. Mr. Markle has won numerous premiums at the La Crosse county grain show, the Interstate Fair, at La Crosse, and at other Wisconsin contests. He won a number of prizes at the recent National Corn Show, held in St. Paul. There are a great many farmers in Wisconsin who can make just as great a success of corn as Mr. Markle does if they only take the pains and care with their seed and crop that he does. Success in corn growing is not attained by accident nor in a season. Mr. Markle has been perfecting his seed for years. He has been showing constantly, sometimes getting beaten when he least expected it, but always going back into another season with a determination to do better than he did the year before.



Conditions are favorable in La Crosse county for good corn, but they are not more favorable than in many other counties of the state. There is some very rich soil in the section in which Mr. Markle resides, and in ordinary years there is sufficient moisture. Last year there was too much, but careful farming even overcame the abundance of rain and made it possible for Mr. Markle to raise this prize-winning corn. It will be remembered that only a few years ago most farmers made no effort to raise corn in Wisconsin. Northern Illinois was considered the extreme northern boundary of the corn belt. This boundary, in a quarter of a century has been moved northward 300 to 400 miles and on an average season where frost does not come too early, considerable corn is matured in Upper Wisconsin. Upper Wisconsin raises good corn for silage in almost any season. In central Wisconsin corn, now that the Wisconsin varieties have been perfected, is a staple crop, and the acreage has been increasing every year.

OZAUKEE COUNTY HOLSTEIN MEETING.

The annual meeting of the Ozaukee County Holstein-Friesian Breeders' Association, which was held in the theater at Cedarsburg, Wisconsin, on Thursday, February 24th, proved to be one of the largest-attended and most enthusiastic gatherings ever held by the association. About seventy-five breeders were in attendance and much pleasure was displayed over the great strides Ozaukee county has made in Holstein breeding the past year.

The association now has about sixty active members, including ten new members accepted at the meeting last week. Considering that this association is still in its infancy this is a splendid showing. More than half the members are owners of pure-bred females and all are using pure-bred sires, this being one of the requirements of membership. The number of pure-bred herds in the county is rapidly increasing and many pure-bred heifers and cows have been introduced into grade herds during the past year, while owners of a few pure-bred females are constantly adding them to their herds. The dairymen are concentrating on the dairy breeds and as the majority of the cows in Ozaukee county are Holsteins this breed is being more firmly established. These farmers are learning that the quick and sure way to build up a fine pure-bred herd is to introduce some blooded females as well as use exclusively pure-bred sires.

One of the important actions taken at the meeting was the adoption of a resolution favoring the organization of a cow-testing association. N. E. Negley, representing the Wisconsin Dairymen's Association, outlined the plan of operation of community associations and explained in detail the purposes and objects. There are now forty-seven of these associations in actual operation in the state and the number is expected to be increased to sixty when those now being reorganized for another year and new associations in progress of organization begin operations. Mr. Negley told of the popular plan under which each farmer who is a member pays $1.25 per cow per year for the test, in addition to a small membership fee of 50 cents in the association for himself.

The subject was discussed very fully and it was evident that sentiment favored such an association and that the members wished to weed out the unprofitable rows in their herds. State Senator Biechler, of the Ozaukee-Sheboygan district, who owns a Holstein herd on his farm at Belgium, Wis., added a few words to what Mr. Negley said. Senator Biechler is an ardent booster for keeping record of the cow's production, and strongly supported the plan. The increased value of the herd which would be caused by the advertising alone was more than the cost of the test, he said, to say nothing of the numerous other advantages. Among these advantages, he said, is the increased value of a herd whose record is known, especially if a good herd, and the knowledge the farmer gets as to which is his best cows and which are his "boarders." Others entered into the discussion, all speaking of the advantage of the test.

Finally a contract was circulated and 270 cows were signed up for an association by sixteen farmers. This is an average of seventeen cows per herd and it was a splendid start for an association. To be successful an association must have about 500 cows, so an Ozaukee county association appears certain, as the officers believe it will be possible to sign up 330 more cows, the number required.

The matter of holding a stock show in connection with the summer meeting in June was discussed.

The election resulted in the selection of the present officers for another year. These officers were: President, George Kohlwey; vice president, P. L. Pierron; treasurer, Walter Ahlers; secretary, C. F. Dineen.

The milk shipping situation was also discussed and the breeders hope to be able to secure better prices the coming year, especially if the shippers' association succeeds in establishing their own distributing depot in Milwaukee in competition with the Milwaukee dealers who now dominate the market. Most of the breeders in the southern half of the county ship to the Milwaukee market and those in the northern half deliver to the cheese factories. The shippers are now getting about $1.70 per 100 pounds for their milk, which is considerably below cheese factory prices, which prices are good owing to the good cheese market. The shippers also hope to force the Milwaukee dealers to grade and pay according to the fat content.

C. J. Will, of Menomonee Falls, president of the Waukesha County Holstein-Friesian Association, spoke on community effort and gave the breeders first-hand information on the building up of the Waukesha association.

The summer meeting will be held the first week in June, the exact date to be selected by the officers.

BUCKEYE
GRAIN DRILLS

Have a Double Run Force Grain Feed—sows any kind of oats, wheat, rye, rice, barley, peas, beans of all kinds and sizes, beets, etc.

The Buckeye Non-corrosive Glass Cone Fertilizer Feed successfully sows in wide range of quantity all brands of standard commercial fertilizers, having an agitator that always keeps the fertilizer moving; a fertilizer hopper lined with galvanized metal.

The Buckeye Frame is made of square tubular steel; will not warp or sag.

The Buckeye Nested Cone Gear Grain Drive. No lost motion. Positive drive. Change of quantity instantly made.

Buckeye Furrow Openers—Any style wanted. Single Disc, open or closed delivery; Double Disc, Hoe or Shoe.

Sizes—Any size from one-horse up.

Buckeye Drills are simple in construction, very light draft, and plant the seed at an even depth.

Send for the Buckeye Catalogue and then go to your local dealer and insist on seeing the Buckeye Drill.

ORCHARD MULCHING.

Many men are interested in the relative merits of orchard culture and straw mulching. All kinds of opinions are expressed and some are certain that culture is cheaper and preferable to the mulch, while others hold a directly contrary opinion. We understand that the same object is kept in view whichever method of treatment is adopted, that is, the aim is to keep down grass and weeds and conserve moisture.

There is much to be said upon both sides of the proposition. It is certain that where straw is obtainable at reasonable prices weeds and grass may be kept down by its liberal application at much less cost than by the cultural method. Also, it can be maintained that moisture will be retained in the soil at a cheaper rate by the straw mulch than by the dust mulch which demands constant stirring. Granted that the good old days when straw could be had for the hauling are gone forever, yet in very many cases a cheap grade of straw, wet tops and wet bottoms of stacks can be very cheaply bought. In any farming community with which the writer is familiar straw stacks, as compared to orchards, are as ten to one.

If a man has an orchard to mulch the first expense need not frighten him. About five tons of straw to the acre, or say to 100 trees, will cover the ground sufficiently deep to stop all vegetation. And a mulch like this will last for four years. If in less time, however, you find that weeds are appearing, it will be wise to patch the mulching.

The time to mulch is in the winter and chiefly for the reason that labor is cheaper at this season than at any other time. The kind of straw is immaterial—wheat, rye, barley or oats. Only, to save later work and worry, let it be clean straw. Avoid buying straw of a man who has notoriously foul fields. It is not absolutely necessary to have straw. Spoiled hay, that lot of clover or slough grass ruined by the untimely rains is just as good.

Mulching is especially desirable in the case of young orchard trees. In their case it is essential to keep down weeds and maintain moisture. Now figure the cost of mulching done in winter and the cost of culture through the long, hot summer. At that time you will be paying your hired man about $30 per month and your horses will be busy in the cornfield or the harvest field. And mulching will do the business at about half the expense of the other method.

But never think that you can slight the mulching or do a poor job and get good results. You can't do it, gentlemen. Better trust to culture than to do a botch job of mulching. You must spread on the straw evenly and thick and tramp it down. We have seen both methods tried in the same orchard and at the end of two years there was very little difference in the thrift of the trees. Some men object to putting straw in the orchard because it facilitates mouse nests and mice gnaw the trees. But don't hesitate for that. Mice will get into the orchard—straw or no straw. If you have small trees protect them by some of the many devices—wrapping or painting or mounding.

Straw will also prevent the washing of soil on side hills and for this purpose it is very valuable. In case of large orchards and in sections where fruit growing is the chief business straw in large quantities will not be available. In that case you will have to rely upon culture and cover crops. But the matter of cover crops is a large subject in itself.

A WOMAN GARDENER AND LIMAS.

One of our subscribers writes to us as follows:

Can a woman who is not afraid of work make a success of growing Lima beans? What other garden crop is likely to be easier grown and more profitable? My husband works in the shops, and, as we have a half-acre garden, I try to make my own spending money. Last year I tried melons, but they were a failure.

A woman who is strong and willing to work might make a success with Limas, and then, again, she might not. Much depends upon the season. You speak of a failure with melons last year. Your experience was like that of many other would-be melon growers. They failed not because they did not do their part well, but because the season was abnormal. Last summer lacked heat and just the few degrees we were minus ruined the melons, the corn crop and also the Lima beans, for they, also, need warm weather.

We cannot tell you of any garden crop which is easily grown. In some years of careful observation we have seen nothing easy in gardening. It is an occupation which requires a careful and continuous labor to make it successful, but it is adapted to persons of light physical mold, because great muscular strength is not absolutely needed.

But because Limas were almost a failure in 1915 it does not follow that they will fail the coming season. The chances are decidedly that we will have a normal season, with sufficient heat to ripen corn, melons and beans. If you can get beans started early upon suitable soil and give them such culture as to push their development you are likely to secure a crop.

You should have a soil which has been manured in the recent past, but no fresh fertilizers this year. Have it plowed very deeply and thoroughly pulverized. Plant the beans in rows six feet apart and running north and south. Use only standard running sorts, for the dwarf or bush varieties, which may be adapted to small gardens, do not yield enough when you are growing for commercial purposes.

Set every bean in the soft, mellow earth with the eye down. Do not plant over one inch deep—less than that if the soil is damp. It is important to observe these rules. If the seed is good plant six inches apart. If not sure that all will grow plant a little thicker and thin out later. When you buy ordinary seed it is best to reject the small ones before you plant.

You understand, of course, that you will need poles or trellises. If you use poles they should stand, after setting, about eight feet above the surface, because the Lima is a tall grower. A very good trellis, and about as cheap as any in the long run, is chicken fencing. Let it be eight feet wide and nail it to posts set about a rod apart.

When the vines begin to run it is always necessary to give them a little hand help. They are like children and need to be started in the way in which they should go.

You must keep down all weeds if you would have good, full pods, and the soil must be kept loose.

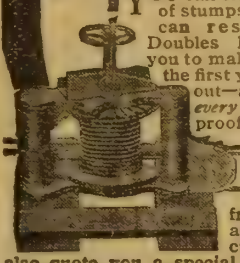
When you begin to pick do not be in a hurry, but let the pods fill out. There is a distinct loss in picking the half-grown beans, for though they sell well and taste good they will both sell and taste better if full grown.

There is good money in Limas when you have a crop. It is best to shell them at home and then, according to whether the market is well or ill supplied, you can sell them at from 20 to 30 cents per quart.

CABBAGE PATCH GENERALLY NEGLECTED:

To the Editor:—It requires intelligent and constant work to raise a good field or even a small patch of cabbage. As a usual thing the cabbage is neglected and the attention they should have is given to some other part of the garden or field. When a large field of cabbage is to be raised the seed is generally sown in hotbeds, but when only a small patch is raised they may be sown in a small box. Take well-rotted manure and fill a box one-third full, then put three inches of rich dirt on top of this, then sow seed the last of February for early plants. The box can be kept in a warm room if there is no

Pull 100 Stumps A Day—With The Hercules



YOU can clear an acre or more of stumps a day. No stumps can resist the Hercules. Doubles land value—enables you to make $1200.00 on 40 acres the first year after stumps are out—and $750.00 in crops *every* year after. Get the proof. Why not

cellar on the farm. It should be watered as often as the dirt becomes dry so the seed will germinate in a few days.

Ground for cabbage need not be over rich, though this does not mean that good cabbage can be raised on poor soil. When preparing the ground where the plants are to be set it should be thoroughly pulverized. This can be done best with a disk, but if you have no disk it should be cross plowed and harrowed thoroughly. If well-rotted stable manure is used as a fertilizer this may be applied after the first plowing or before the disk is used, as the cross plowing or disk will thoroughly work it into the soil. The plants should not be set on a dry or hot day. Select, if possible, a day when a light rain is falling.

I find it a good plan to pull the plants a day or two before they are to be set and put them in a cool place, covering them with a well-moistened cloth. They will be made stronger by so doing and will not wilt as quickly as if taken from the bed direct to the field.

Cabbage plants should be set thirty inches apart each way. This is for the full-leaf varieties. The Danish ballhead and other small cabbage may be set eighteen inches apart.

After the setting has been completed cultivation should begin at once and be continued, if possible, each day that the soil is in condition to be worked. The ground should never be allowed to crust and stirring the ground often will prevent evaporation. A double-shovel cultivator is the best for general use after the plants begin to form heart and it may be used even after the outside leaves begin to touch between the rows, as the loss by breaking off will not injure the plant or interfere with its development. In the last plowing throw a good furrow against the row.

E. F. L.

A STUDY OF BEES.

To the Editor:—We, as humans, waste considerable time in gaining knowledge, which often lies idle or even is forgotten, but the little bee commences at its work almost immediately without any time lost in absorbing the knowledge necessary for the performance of its duties, for it is instinct which guides them in their work.

Under normal conditions there are three kinds of bees present in a hive, namely, a queen, drones and worker bees.

There is only one queen bee in a hive, she being largest of them all and can be distinguished from the others by her elongated body, also by the deportment of the other bees to her, for well do they seem to realize that she being the mother of all the bees is absolutely essential to the welfare of the colony. She is capable of laying from 3,000 to 5,000 eggs in a day in the height of the season and during this part of the season an average worker bee's life is only a few weeks, while the life period of a queen may be several years, but as she grows older her power of reproduction decreases, and it is for this reason that we beekeepers aim to have our colonies headed by a young queen.

Strange as it may seem the queen lays only two kinds of eggs, and yet they can be made to produce three different kinds of bees.

It must be remembered that the queen is the only fully developed female, while the workers are only partially developed females. The egg destined to become a queen is the same as the one destined to become a worker, but as soon as the egg that is to become a queen hatches it is fed lavishly of a highly-concentrated food known as "royal jelly," also her cell is enlarged so as to give room for her full development, while that egg destined to become a worker is not fed on such a high concentrated food, neither is its cell enlarged. It takes from fifteen to sixteen days for her full development.

The worker bees are the smallest and the most numerous. They perform all the work, such as feeding the young, building the comb, producing the chyle which is used as food for the larvae, gathering nectar and edulcorating it into honey, etc.; they require twenty-one days to reach their full growth.

Drone bees are the only male bees in the hive; they appear clumsy and their sole purpose is in fertilization of the queen. They are not possessed of a sting or proboscis. One can find them in the fall when the honey flow has ceased and they are not longer needed, hovering around the entrance, for they are driven out by the other bees; here they finally succumb. They require twenty-four days for full maturity.

The bee passes through three different stages before becoming a perfect insect. First the egg larvae and then the nymph stage. All eggs hatch on the fourth day of incubation, but the period of growth varies.

In observing a strong colony in the height of the honey flow, opening up a super where they are pulling away with might and main in drawing out the combs, literally tens of thousands of these busy toilers fairly quivering with the excitement of work. At the first glance one may wonder how they produce this wax; let us examine one of these workers closely and we will notice the wax plates visible on the ventral side of the abdomen of the bee; there are eight of these wax-pockets, and into these the liquid wax exudes, through pores which perforate the wax plates, and it hardens to form the scales as it comes in contact with the air. How they remove these wax scales is hard to observe, for bees are exceedingly lively and constantly shifting their positions, so it will be hard indeed to follow them in their movements. No single bee ever finishes one piece of work herself or ever works steady on a job, for they all seem to help along more or less. They are capable of building five different kinds of cells, namely, worker, drone, queen, storage and attachment cells. All are hexagonally shaped except the queen cells.

The worker cells are the smallest and the most plentiful, measuring approximately five cells to the inch.

The drone cells measure four to the inch.

The queen cells are not grouped together and are peanutlike in shape when completed. Furthermore, these cells are usually torn down soon after the queen emerges and rarely, if ever, are used for any other purpose.

The attachment cells are those cells at the edge of the combs attached to the frame and are irregular in size.

Honey cells may be either composed of drone or worked cells, but it should be our aim to have as little drone comb built as possible. These honey cells may be much prolongated, while when used for brood rearing they must remain as near as possible to a certain depth.

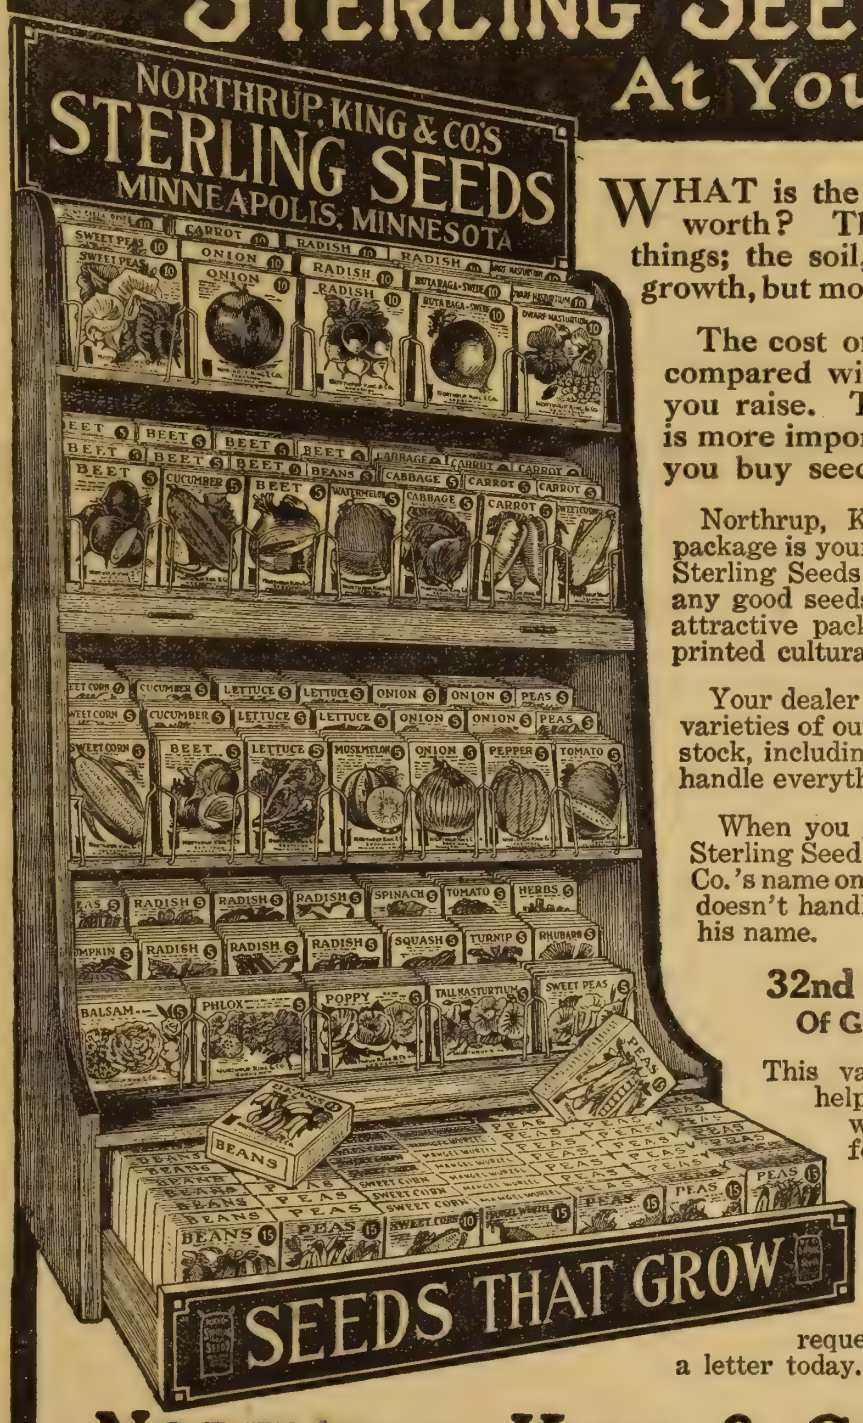
The bees gather and store three substances known as honey, pollen and propolis.

Dependable Garden Seeds

All Varieties Easily Selected From

NORTHRUP, KING & CO.'S STERLING SEED CASE

At Your Dealer's



WHAT is the product of your garden worth? That depends on several things; the soil, the season, care during growth, but most of all on the seeds used.

The cost of the seed is very small compared with the value of the crop you raise. That's why QUALITY is more important than PRICE when you buy seeds.

Northrup, King & Co.'s name on the package is your assurance of quality seeds. Sterling Seeds are no higher in price than any good seeds. They are put up in large attractive packages on each of which are printed cultural directions.

Your dealer will gladly get for you any varieties of our seeds he does not carry in stock, including grass and field seeds. We handle everything in the seed line.

When you go to the store look for the Sterling Seed Case and Northrup, King & Co.'s name on the packets. If your dealer doesn't handle our seeds, please send us his name.

SEED CORN—TESTED—GUARANTEED

Early Iowa Yellow Dent.

SEED that will Grow and Produce Bigger Yields and Better Corn. Seed as much superior to "Just Corn" as a Thoroughbred is to the scrub.

Get your Seed Corn from the men who GROW it and KNOW. Varieties that will mature in YOUR locality and yield a crop. Here they are; not large, late or jumbo varieties—not little, worthless or inferior sorts:

Pride of North (Yellow) 90 DAYS; Silver King (White) 90 DAYS;
Early Iowa Yellow Dent 95 DAYS; Iowa Gold Mine (Yellow) 95 DAYS;
Iowa Silver Mine (White) 100 DAYS.

Don't be fooled! It's too important, but "Watchful Waiting" time is past and now you must act, so let's use common sense and reason. Ninety-five days in Page County, Iowa, is no longer than 95 days at St. Paul, Minnesota. Isn't it a fact? And the Weather Bureau tells us the sun shines just as bright and the temperature is just as warm there as it is here during the corn growing season.

Here we raise Seed Corn FOR YOU that Grows, Matures and Yields in Northern Iowa, South Dakota, Illinois, Nebraska, Southern Minnesota and Wisconsin. For best results IT LEADS THEM ALL. It's pure-bred, hand-picked, butted and tipped and every ear examined as to vitality. It tests 94 per cent or better. Every bushel sold subject to our GUARANTEE; READ IT. We take the risk, you be the judge. We'll serve you fairly, honestly and satisfactorily.

All varieties $3.00 per bushel; $2.75 per bushel in 10 bushel lots and up while it lasts. Special Seed Corn Booklet and samples free. Write for them today. All orders shipped same day received. Address

Our Guarantee

Every Bushel of our Seed Corn is sold subject to your approval. If not found as represented and entirely satisfactory, it may be returned to us, at our expense, any time within 12 days and purchase price will be promptly refunded. This gives ample time to inspect, examine and test it to your full satisfaction. YOU RUN NO RISK IN ORDERING SEED CORN FROM US. Order direct from this advertisement. ALL ORDERS SHIPPED SAME DAY RECEIVED.

IOWA CORN GROWERS' SEED CO., Essex, Page County, Iowa

Sudan Grass New Forage Crop.

Profitable For Hay and May Be Raised For Seed Product in Wisconsin---By George B. Mortimer, Wis. Station.

THERE is perhaps no crop that has so completely occupied the attention of the farmers of southwestern United States for the past few years as has Sudan grass. It has spread from Texas as a center where it was first introduced in the spring of 1909, until now we find the northern states growing the plant, as yet, largely in the way of experimentation.

Sudan grass was brought to the United States in 1909 from Africa by Prof. C. V. Piper, of the United States Department of Agriculture. This plant, like Johnson grass of the south, is a sorghum, and in searching for sorghums without the troublesome underground stems that Johnson grass has Mr. Piper found this plant growing in Egypt under the name of Garawa. Only a small sample of seed was secured, the larger part of which was planted in Texas in the spring of 1909. On account of the excellent showing made against drouth and other unfavorable conditions all of the seed was carefully preserved and planted again the next year. Again the plant gave such a wonderful account of itself that some of the seed was disseminated among the farmers with the result that Sudan grass now occupies a firmly established place in the farming of southwestern United States.

Like all sorghums and plants of similar nature, Sudan grass requires a warm season and soil for its best development, but from trials conducted in the northern tier of states it has been found that it will do very well even in the shorter growing seasons of this section. As to moisture requirements, this plant is quite drouth resistant, due perhaps to the extensive system of fiberous roots with which it is supplied.

The claim is made that this grass will grow on most every type of soil from heavy clays to sandy soils, provided the latter is reasonably fertile.

Like the grain crops, Sudan grass does better upon fall-plowed land.

The preparation of the seed bed should be the same as that for corn. The young plants do not grow so rapidly at first and are liable to be crowded by the weeds early in the season, unless special effort is made to destroy them as far as possible before planting. Consequently fall plowing, together with early and frequent harrowing up to planting time are recommended.

For a state as far north as Wisconsin Sudan grass should never be seeded until danger from spring frosts has passed. About corn planting time or even a week or two later seems to be the best time for planting. This grass may be seeded in close drills, cultivated rows or broadcasted. When sown in cultivated rows the usual rate of seeding for hay purposes is from eight to ten pounds of seed per acre. Under humid conditions the best method of seeding for hay purposes is either drilling by means of an ordinary grain drill or broadcasting. Well-cleaned seed feeds freely from the grain drill is distributed evenly and an even stand is secured. Either of the above methods requires from fifteen to twenty pounds of seed per acre.

When Sudan grass is grown for hay it should be cut in full head and before any of the seeds are formed. It is at this stage that the hay is most palatable and nutritious. Cutting for hay after the seeds have set makes hay of lower feeding value.

From central United States southward it is possible to get two cuttings each season for hay, and in some instances as many as four cuttings have been made. The easiest way to harvest the crop is with the mower. It cures very readily and can be cut in the morning and raked up the next day if the weather has been bright and sunshiny. The best quality of hay is made by placing it in small cocks and allowing to cure in that way. The leaves are retained well and if handled properly the hay will be bright, leafy and sweet.

There are few grasses that are injured so little by standing beyond the proper stage of maturity as Sudan grass. This is due largely to the fact that the numerous stools mature successively later than the main stem and hence always furnish immature stalks, even though the older ones are ripened.

The yields vary, depending largely upon the number of cuttings made. Under irrigated conditions as high as eight tons of cured hay have been reported. In Wisconsin where not more than two cuttings may be had the yield will not on an average run higher than five tons, with perhaps an average of about four.

The good seeding habits of this grass is one of its very best features. The seed is produced in abundance and is retained well so that loss from shattering is not very great. When the seed is practically mature it may be cut with a grain binder and left to cure in shocks. It may be threshed with an ordinary grain separator. The highest yields of seed are produced in the semi-arid West where dry, warm weather prevails. The yields reported range from 300 pounds to 1,400 pounds per acre. Good seed will weigh forty pounds per bushel.

Up to the present time the seed has been rather expensive, ranging from 50 cents to $1.50 per pound. This is due to the fact that nearly all of the seed being used is grown in Texas.

As a pasture grass Sudan is lacking in several of the essentials of a good pasture. Being an annual plant a turf is not formed and considerable injury from tramping would result. Undoubtedly live stock pasturing upon it would pull out many of the plants.

During the past season Sudan grass has been under trial as a forage crop for Wisconsin conditions. The test conducted by the experiment association were based upon various rates of seeding for forage and for seed. Owing to the unusual weather conditions prevailing the past season the plant did not get a fair test. A prolonged, cold spring followed by a rather cool summer with early fall frosts was not conducive to very good results.

The tests conducted for seed yields were entirely destroyed by the early fall frosts. Of the members of the association reporting upon their experiences with this grass, two have reported small yields of mature seed, so that I feel it is safe to say under ordinary seasonal conditions a seed crop may be expected in Wisconsin.

Even under the unfavorable conditions of the past season the crop made a good showing for forage purposes. The seeding was not made until June 23d, so that the yields reported were from only one cutting. Broadcasting at the rate of ten pounds gave a yield of three and three-fourths tons of cured hay per acre. This was the highest yield of the various rates of seeding, that from the thirty-five-pound rate yielding two and one-half tons. From the tests conducted it would appear that the best rates are between ten and twenty pounds of good viable seed per acre.

It would appear from the records that this plant has made since its introduction into this country that it should find a place under certain conditions and for various purposes in Wisconsin farming. Undoubtedly it cannot become a crop of our primary rotations, taking the place of clover, alfalfa and corn.

Then, too, there is the seed production phase for Wisconsin farmers to consider. It is quite possible that the South will have to look to the north-central states for the production of pure seed on account of the freedom with which Sudan and Johnson grasses mix in that section of the country.

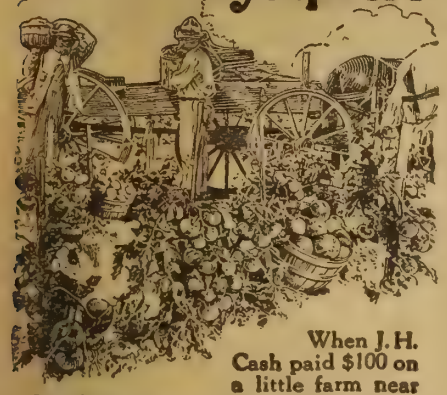
$20,000,000.00 Steel Works now in operation at Duluth. Employs many highly paid workmen. They are good eaters and need food. Wanted at once, 500 Farmers to supply them. L. B. Arnold, Land Agent, C. R. I. & P. Ry. Co., 151 Wolvin Bldg., Duluth, Minn.

WRITE Photoplays for Producers. $25 to $500 for good ideas. Particulars furnished. Paramount Photoplays Co., Box 1402, Los Angeles.

A crop harvest by April 1st



When J. H. Cash paid $100 on a little farm near Camden, Ark. he had just $40 left—yet in three years he cleared his debts and bought 80 acres more. Its easy to understand why farmers along the

Cotton Belt Route in Arkansas & Texas

make headway so fast when you consider the soil and the season down there. When farmers up north are "drawing on the bank" for living expenses, Mr. Cash, and thousands of others in Arkansas and East Texas are cashing in on crops. Mr. Cash sells garden truck by April 1st; by the 15th he's marketing new potatoes, by May its strawberries and there's some crop to sell every month until Christmas. He's made five crops bringing $537 per acre in one season.

And the crops are not all truck or fruit. Corn, peanuts, clover, alfalfa, etc. yield big. Mr. Kapp, near Cash's place, makes 62 bu. of corn on his land. Mr. I. Z. Zimbrough of New Edinburg, Ark. makes 100 bu. of peanuts per acre, selling at $1 per bu. Rudy Stutter, of Stuttgart, Ark. says "I plant oats the last of September and in 15 years I've never lost a crop. Last year I threshed out 75 bu. per acre. Jacob Yoder, on the place adjoining mine made 90 bu. per acre." Near Texarkana, Tex. J. M. Champion shows how a farmer can make $1700 and $1800 a year net on twenty acres by taking advantage of the many crops per season which the long growing season allows.

Go where you will in Arkansas and East Texas you'll find farm opportunities even bigger than you've read about.

Two free books!

A farmer wrote them; and he knows what you want to know about a section new to you. They tell about the character and cost of lands, climate, crops raised, etc., and about schools, churches, towns, social conditions. Brimful of photograph pictures taken on the ground. WAIT!
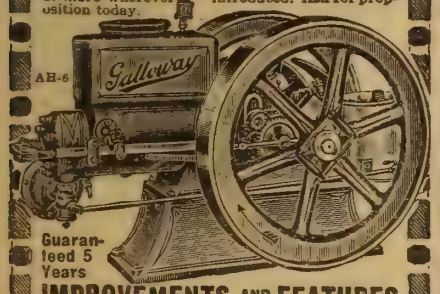
DON'T DO A THING
ABOUT BUYING AN ENGINE

Until you have seen this new 1916 250-p. book that tells all about Galloway engines and explains my new extra special advertising distribution offer. If you answered all the engine advertisements ever published you would not find an offer fairer, squarer or more in your favor. You owe it to your pocket-book and the satisfaction that you demand in the operation of the engine you buy to answer this advertisement and learn the particulars of this new 90-day offer to distribute 10,000 more Galloway Masterpiece Engines from 1 3-4 h. p. to 16 h. p.

The great Galloway chain of factories are running day and night. We are turning out more Masterpiece engines than ever and the reason is that we are building this engine so good from such a highly perfected design, of such good materials, and by such thoroughly skilled workmen, that every Galloway Masterpiece sells one or more wherever it is introduced. Ask for proposition today.



Guaranteed 5 Years

IMPROVEMENTS AND FEATURES

include valves in the head; extra cooling surfaces, large water pot; frost-proof cylinder; adjustable bearings, economy carburetor; uses any fuel; large perfectly balanced fly wheels; built-in magneto; Hercules water-cooled cylinder head, cannot blow off; easy to start, no cranking; needs no batteries; independent of weather, hot or cold, wet or dry. A mechanical masterpiece! These features and many others make Masterpiece engines power kings in their field. Ask today for this new book printed in four colors. It will solve your power problems. A postal gets it. Engines shipped from Waterloo, Council Bluffs, Kansas City, St. Paul, Chicago. Wm. Galloway, Pres.

FOR MAKING SPRAY MIXTURES.

The Connecticut Horticultural Station gives the following directions for making spray mixtures:

Commercial Lime-Sulphur.—Any of the commercial lime-sulphur mixtures on the market testing 33 degrees B. may be used for spraying fruit trees. For winter treatment these are usually diluted with one part of mixture to nine parts of water. For summer treatment the dilution is usually one and one-fourth to one and one-half gallons to fifty gallons water.

Self-Boiled Lime-Sulphur.—This is a homemade mixture as follows: Eight pounds of fresh lime are started slaking in a barrel with a little water (warm water preferably in cool weather), and when the mass has begun to heat, eight pounds of sulphur flour are quickly sifted in and thoroughly stirred with the slaking lime. This, at the consistency of a rather thick paste, is allowed to heat for fifteen minutes from the time the sulphur is added, when it is cooled down with additional water. The mixture is stirred and strained into the spray barrel, to remove the coarser sediment and diluted to the fifty gallons.

Usually three barrel lots can be made at a time in an ordinary barrel by using three times amount indicated above. This amount furnishes more heat and makes a little better mixture than when made up in single barrel lots. A third of the amount is then used with a barrel of water.

Bordeaux Mixture.—Four pounds of copper sulphate, are dissolved in hot water or by suspending the crystals in a coarse bag in a half barrel of water. Four pounds of fresh lime are slaked in a small amount of water, and then strained into the spray barrel about half filled with water. To this is then added the half barrel of dilute copper sulphate.

When several barrels are needed, stock solutions can be made up as follows: The copper sulphate is dissolved in a barrel at the rate of one pound to one gallon of water, and the lime, after slaking, is diluted so that it also contains one pound per gallon of water. Then, when needed, four gallons of the lime water, after stirring thoroughly, are strained into the spray barrel, this half filled with water, and four gallons of the copper solution, further diluted to make about half a barrel are poured into this.

Lead Arsenate.—This poison is manufactured in both paste and powder form. The paste form is generally preferred for orchard work, but it dries and becomes lumpy if kept from one year until the next. It also corrodes metal containers. The paste contains 50 per cent water and should be used in the proportions of three pounds in fifty gallons of water. It is best to first mix thoroughly with a small amount of water before putting into the spray tank.

Dry or powdered lead arsenate will keep indefinitely in a dry place: In spraying, use just half as much as of the paste form, or one and one-half pounds in fifty gallons of water. The dry lead arsenate may be thrown into the spray tank after it has been filled with liquid, and it will be readily moistened and distributed.

Both paste and powdered lead arsenate may be used in connection with lime sulphur. Bordeaux mixture or nicotine solution and larger quantities of arsenate may be used if desired.

Nicotine Solutions.—Several of these are now sold containing 40 per cent or more of nicotine, usually in the form of sulphate. For most kinds of aphids one-half pint to a barrel of water is sufficient, but the amount may be much increased or doubled without danger of causing injury. Nicotine solutions may be safely used in combination with lead arsenate, Bordeaux mixture, or lime sulphur; with any one or with all of them.

Miscible Oils.—Several brands are now on the market, and for dormant spraying each should be dilutel at the rate of one part in fifteen parts water. The contents of each original package should be thoroughly mixed or shaken before attempting to dilute any portion of it. As a rule, it is unnecessary and inadvisable to mix miscible oils with other spray materials. Such oils are chiefly used on dormant trees.

Cautions.—Before beginning to spray, know what you are spraying for. If you have troubles which you cannot identify, send specimens to the station and get information and advice.

Never spray any fruit tree while in bloom. It kills your best friends, the honey bees, which pollinate the flowers.

TUBEROUS BEGONIAS.

Here is a flower whose merits are not fully recognized. Comparatively few people grow it and yet in beauty and attractiveness it is unexcelled. Because it has some special requirements in treatment it has received from hasty cultivators the reputation of being difficult to grow. And yet the special treatment which it needs is simple and easily understood and flower lovers everywhere should learn to grow it. Perhaps the word "everywhere" should not be used, because it doubtless thrives best in cool climates.

Any person who is familiar with the common house begonias can understand the form of the flower in the tuberous varieties, but that familiarity gives no conception of the size of the flower. It is often three inches across and the variety in colors is complete. You can get all the hues of the rainbow. They are very free bloomers. All leading florists carry the tubers in stock and the price is not excessive, considering what you get.

Buy the tubers early and start them in pots or shallow boxes in hotbeds, preferably in March or April. Let the soil you use be a mixture of sand, leaf mold and loam. You should aim to get stocky plants, so do not let them get too hot, which will make them leggy. Give plenty of fresh air as soon as days get warm so that glass is not required. This will harden the plants, which is necessary before planting out.

Do not plant out in your flower border before mid-May, after frost danger is past. The soil cannot be too rich. Give plenty of room, for the plant has a low-spreading nature. Eight inches apart is not too much space. If you have some spot with partial shade they will do well there. If the soil becomes very dry water them at night or early in the morning. Sometimes a fungous rot attacks the leaves and in that case sift over them flour of sulphur.

It is easy to keep the bulbs if you dig before freezing, dry well in the shade and pack in dry sand. They will keep well in a room or cellar where the temperature is from 40 to 50 degrees.

What boot-wearers—like yourself—are saying about the famous molded

Goodrich "HIPRESS"
Rubber Boots and Shoes

We've told you of the wonderful new "HIPRESS" process and how it makes possible SO MUCH MORE WEAR AND COMFORT.

NOW we're going to give you specific instances of their superiority—not what WE THINK they will do, but WHAT THEY ARE DOING.

Bob Gray, up in New River Station, N. B., Canada, wrote us recently about a pair of "HIPRESS."

Said they were worth their weight in gold—never played him a dirty trick—no sore, tired feet—always dry. Said that 3500 miles would be a conservative estimate of the walking he had done in the boots, much of it over rough ground, and still he couldn't wear them out! Now, this is the sort of things "HIPRESS" is doing everywhere—it has set a NEW STANDARD OF BOOT AND SHOE WEAR!

"HIPRESS" rubber boots and shoes are made by a new process—the same tough, gristly rubber that goes into Goodrich Auto Tires is used, MOLDED INTO ONE SOLID PIECE! Faults of handwork eliminated—they won't leak, peel or come apart—they'll outwear any other made. The genuine has the RED LINE ROUND THE TOP.

W. P. BUSSEY HERD, OMRO, WISCONSIN.

For New Or Remodeled Barns

JAMES Barn Plan Service and JAMES Sanitary Barn Equipment have proved their value wherever barns are built for *profit*. The dairyman realizes that the first essential to making money is a good barn. Even the best herd will lose its efficiency if poorly housed.

JAMES service fully described in our new book, "The JAMESWAY;" same book tells all about the great JAMES line of Stalls, Stanchions, Pens, Carriers, Ventilators, Trucks, Watering Buckets, etc., designed and built by W. D. James and his associates, originators of sanitary barn equipment ideas.

To get a copy of this book, tell us how many cows you own, when you expect to build or remodel a barn, and what equipment you are most interested in. Write today.

FARM MECHANICS

Auto, Farm Engine and Farm Machinery Ailments diagnosed and remedies suggested in this department.

QUESTIONS AND ANSWERS.

Storage Battery Leaks.

Would like to know what would stop a storage battery from leaking. I have a battery that seems to lose too much water. Could there be too much acid in it?

Answer.—If your storage battery actually leaks it is due to a cracked cell and the only sure way of fixing it would be to obtain a new cell. It may be that you are overcharging your battery, which causes the electrolyte to be given off as a spray at the vent hole in the top of the cell.

Alcohol for Engine.

I would like to know how denatured alcohol would work in a Ford engine. How will it work in comparison with gasoline and what would be the effect on the engine? Would a different carburetor be required?

Answer.—It would require a new carburetor unless you can surround your present carburetor with a hot air or hot water jacket. The heat is necessary to vaporize the alcohol. Alcohol has no bad effect on an engine if properly carbureted. The same power is obtainable from the same quantity of fuel, but about 10 per cent more power is obtainable from the same engine by using alcohol, as more alcohol can be used.

Engine Lacks Power.

I would like to ask a question about my Majestic engine. It is fourteen horse power. It will run all right empty, but as soon as I put the belt on it will slow down and stop. It has a relief valve and a damper. It will not run with the damper open. The engine has a Webster magneto, and seems to have a good spark. What is wrong?

Answer.—It looks as if your engine is not getting enough gasoline. Be sure that the gasoline pipes are not stopped up. If you have a carburetor change the float valve so as to carry a higher gasoline level in the float chamber. Poor compression or faulty timing would also cause the trouble. The exhaust valve should close and the intake valve open soon after the piston passes dead center at the end of the compression stroke. In the retarded position the spark should occur just after the dead center at the end of the compression stroke.

Igniting Blasts.

How can I arrange to ignite a series of blasts at one time, using dry cells and a coil instead of a fuse? I am using black powder.

Answer.—Figure 1 shows the arrangement of the wiring, using a coil. The high-tension wires must be well insulated. The wires at P P P enter the powder. The spark gap at these points should be about one-thirty-second of an inch. Figure 2 shows the method of wiring without a coil. The powder is at W W W. The ends of the branch wires are connected by a loop of very fine iron wire, about No. 32 gauge. When the current is turned on these fine wires become white hot and ignite the powder. The longer the main line the greater the number of dry cells required or the larger the diameter of the wire. With the high-tension system, No. 14 copper wire heavily insulated, may be used for any reasonable length. With the low-tension system ordinary double cotton-covered wire may be used, but the rubber-covered wire is more durable. Use No. 14 wire for the low-tension system if the distance does not exceed 100 feet, or No. 10 wire for a distance between 200 and 300 feet.

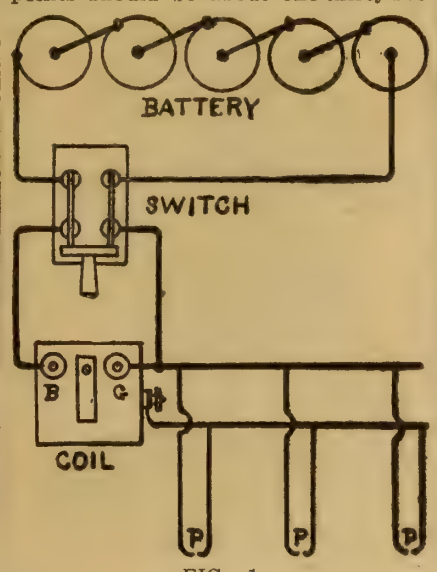

FIG. 1.

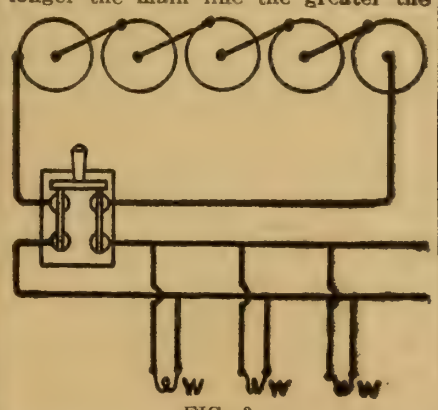

FIG. 2.

Some Tractor Questions.

What is the horse power of a four-cylinder motor having a four and three-fourths-inch bore, six and three-fourths inch stroke, running at 800 R. P. M.? If this motor were used in a tractor weighing 5,200 pounds, what would be the draw bar pull at two miles per hour? What is the rated horse power of a two-cylinder motor having a six and one-half inch bore, seven-inch stroke, running at 570 R. P. M.? If this motor were used in a tractor weighing 7,200 pounds, what would be the draw bar pull at one and three-fourths miles per hour?

Answer.—Manufacturers have no fixed rule for rating their engines and tractors. The following estimates are only approximate: The first engine should develop thirty-two horse power. The drawbar pull would be between 3,000 and 3,500 pounds. The second engine should develop twenty-four horse power. The drawbar pull should be close to 3,000 pounds.

Valuable Book Sent FREE

Get Full Power

Your tractor needs all the power it can develop, both in pulling and stationary use—two good reasons for installing

McQUAY-NORRIS
LEAK-PROOF
PISTON RINGS

To get full power you must have good compression, and that's why you've got to use Leak-Proof Rings. And, besides stopping gas leakage, they keep the oil out of the cylinders so that you're not troubled with carbon fouling spark plugs and valve seats. They are strong and durable—never lose fit or bearing. Cannot wear or score the cylinders.

Leak-Proof Piston Rings are made in all sizes—easily installed. You can get them from your supply dealer. If he hasn't them—write us, giving his name. We'll see that you are supplied.

McQuay-Norris Mfg. Co., 2820 Locust St., St. Louis, Mo.

Send for FREE booklet—"To Have and to Hold Power". It tells all about compression and what Leak-Proof efficiency means.

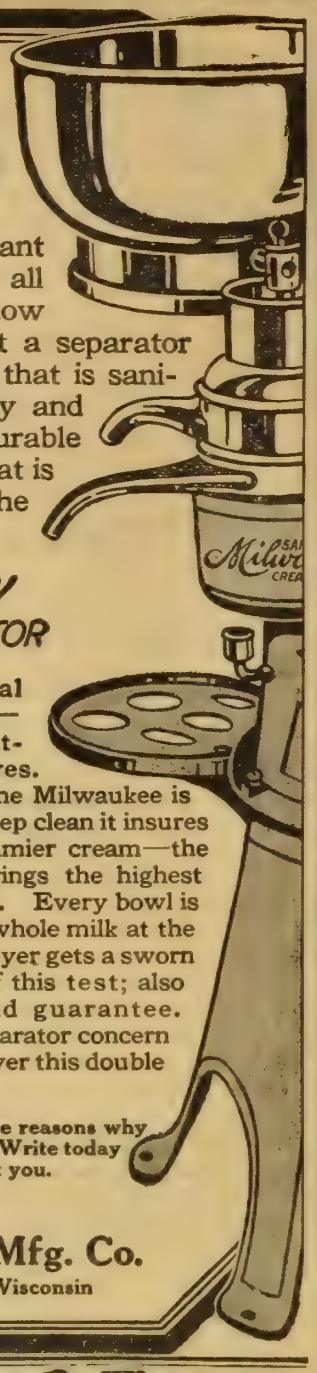
More Cream Money



When you buy a separator you want to know, first of all, that it will get all the cream and make your herd show greatest possible profits. You want a separator that will save time and labor—one that is sanitary and easy to clean—runs easily and gives least trouble. You want a durable outfit, that will last for years and that is always ready to work. Users of the

SANITARY Milwaukee CREAM SEPARATOR

find that it meets all these requirements. It has only half as many discs as other separators—fewer discs to clean and easier to clean because they are smooth and made of aluminum. No holes or pockets to catch and hold impurities. Discs are not numbered. They don't have to be kept in numbered rotation. The Sanitary Milwaukee with fewer discs skims closer, easier and quicker, because of the tapered discs and proportional feed slides—exclusive patented features.

Because the Milwaukee is so easy to keep clean it insures cleaner, creamier cream—the kind that brings the highest market price. Every bowl is tested with whole milk at the factory. Buyer gets a sworn certificate of this test; also an iron clad guarantee. No other separator concern offers the buyer this double protection.

Before you purchase any separator find out all the reasons why it is more profitable to buy a Sanitary Milwaukee. Write today for illustrated catalog and name of dealer nearest you.

"It grows with the herd"

Milwaukee Separator Mfg. Co.

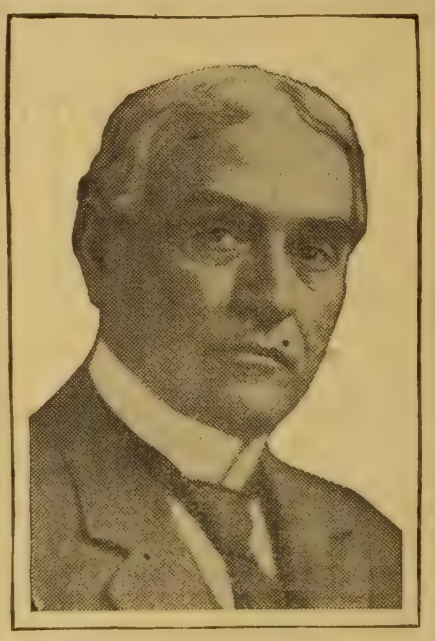
ROCK ISLAND PLOW COMPANY

413 SECOND AVE. ROCK ISLAND, ILL.

DEATH OF DR. HENRY B. FAVILL.

Dr. Henry Baird Favill died recently in Chicago at the age of fifty-five years. He was familiarly known throughout Wisconsin as Dr. Harry Favill. He was a member of a Jefferson county family, very prominent in the early days of dairy development in this state. While Dr. Favill practiced in the city of Madison for ten years, and had, more recently, become a physician of nation-wide reputation, he was more generally known in Wisconsin as a lover of Holstein cattle. His interest in this prominent dairy breed centered chiefly in Wisconsin, but he was known by Holstein breeders all over the world. In 1913 he was elected president of the National Dairy Council and vice president of the national organization of Holstein breeders in 1916.

Dr. Harry Favill attended the Wisconsin Holstein-Friesian breeders' meeting at Neenah in March, 1915, and was a prominent figure at that meeting. He was very much interested in the subject of county and community organizations and has directed his dairy enthusiasm toward the organization of "locals." At the Neenah meeting both Dr. Harry Favill and Dr. John Favill, of Appleton, were prominent in all the proceedings. Dr.



DR. HENRY B. FAVILL.
Chicago physician who was prominent in Wisconsin Dairy Circles.

John Favill is a minister-dairyman. The grandfather of the two Favills was a dairyman back in Herkimer county, New York, in the early days. The Favills describe that country as one where there are more hills than grass. There were six boys and five girls in Grandfather Favill's family, and every one of them learned dairying. Five of the brothers left New York state and settled in Wisconsin, four of them in Jefferson county near the city of Lake Mills. Both Dr. Harry Favill and Dr. John Favill have taken considerable pride in recent years in looking back upon the part which the Favill family took in dairy development in Jefferson county.

Dr. Harry Favill had been invited to attend the meeting of the Wisconsin Holstein-Friesian Breeders' Association, which is in session at Watertown this week. He would have been able to meet there many of the present-day breeders of Jefferson and Dodge counties. A good many of these men were boys when Dr. Harry and John were boys. Dr. Harry Favill owned a farm near Lake Mills, Jefferson county. This was devoted almost entirely to the dairy business and the care of his Holstein herd.

Dr. Favill was born August 14, 1860, at Madison, Wisconsin. His mother was Louise Baird, the daughter of a Green Bay attorney and Elizabeth Monroe Fisher, a grandchild of a prominent Ottawa chieftain. Dr. Favill was proud of his Indian blood. Once, when friends asked whether he could qualify as a member of the Mayflower society he replied, "No, my people were on the reception committee."

Besides being a leader in his profession, Dr. Favill was accorded many political honors in Chicago. He was president of the Municipal Voters' League from 1907 to 1910. He was, for a time, president of the Chicago City Club and was a member of the Public Efficiency Bureau. He devoted special attention to the study of living conditions in Chicago. Several days before his death Dr. Favill was in Springfield, Mass., where he had gone to deliver an address before the New England Dairy Association, and to go over some of the plans for a national dairy show.

LAW QUESTIONS.

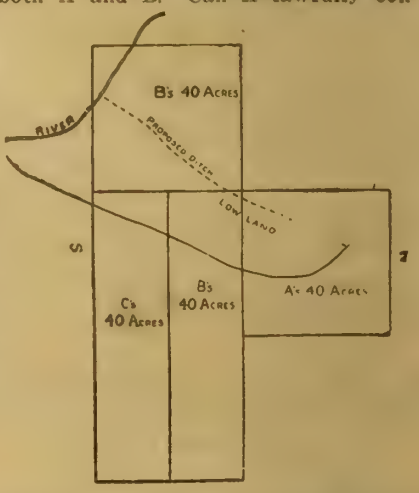
Mortgage—Wife Must Sign.

A Wisconsin Subscriber.—A husband and wife have a farm, the title of the farm is in the husband's name, the wife's name not being mentioned in the deed. (1) Has the husband a right to borrow money at a bank without his wife's knowledge or consent? (2) Can the husband lawfully mortgage the farm without the wife signing the mortgage?

Answer.—(1) He has. (2) He cannot. The wife must sign and acknowledge such mortgage in order to render it valid.

Draining Over Another's Land.

Mr. F. R. Jacobitz, Campbellsport, Wis.—The accompanying diagram represents the relative locations of the lands of A, B and C showing location of the low lands, river and course of proposed ditch, marked by dotted line. Such a ditch would benefit the lands of both A and B. Can A lawfully con-



struct such a ditch to the river, over B's land, without his consent, and if so, who will have to pay for constructing the same?

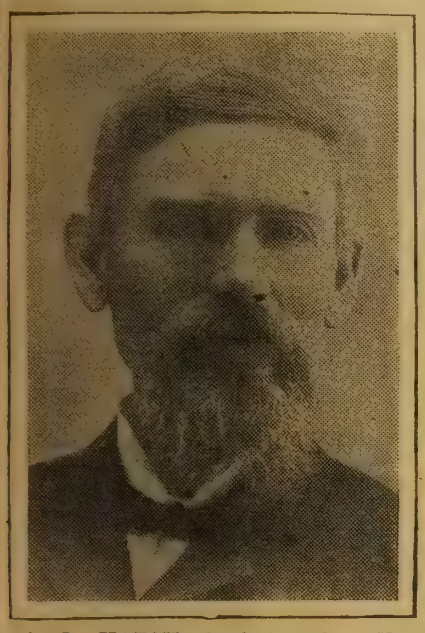
Answer.—A cannot lawfully construct such a ditch over B's land without B's consent.

MEN WHO ORGANIZED WISCONSIN COW-TESTING ASSOCIATION AT MADISON LAST MONTH.

DEATH OF A. L. HATCH, WISCONSIN HORTICULTURIST.

Death has called another prominent Wisconsin man—Mr. A. L. Hatch, of Door county, who was recognized some years ago by the college of agriculture for his distinguished services to horticulture in this state. Mr. Hatch died recently at Pittsburgh, Pa., and his death came as a great shock to his thousands of friends in this state.

Mr. Hatch has been referred to as the "discoverer of Door county"—that little county on the peninsula which protrudes into Lake Michigan and which in recent years has won the distinction of being the greatest cherry producing county in America. This



A. L. HATCH, STURGEON BAY.
Known as the father of the cherry industry in Door county, Wisconsin.

county, surrounded on three sides by water, has a climate ideal for fruit production, and when Mr. Hatch established his orchards in the neighborhood of Sturgeon Bay years ago he displayed great foresight. He went to Door county with the advantage of years of experience in the Kickapoo valley, another of Wisconsin's great fruit sections, and started an orchard which was the beginning of orcharding on a commercial scale on the peninsula.

Mr. Hatch made fruit growing his life work, and into it he put energy, enthusiasm and hard work. What was worth doing with him was worthy of doing well. He cultivated and sprayed properly. He studied fruit growing. No better tribute to his life and his services to horticulture in Wisconsin has come under the notice of The Wisconsin Farmer than the following brief article from the pen of Mr. Frederic Cranefield, secretary of the Wisconsin State Horticultural Society, which appeared some years ago in Wisconsin Horticulture, the official organ of that association:

Mr. Hatch lives at Sturgeon Bay. The whole country up there is his—by right of discovery—and a very substantial portion of it by right of ownership, "recognized in the sheep-bound volumes of the law." It is not yet quite twenty years since Mr. Hatch, in company with Professor Goff, discovered Door county, and today it is the leading fruit producing county in the state. (Make a heavy mark for foresight.) Just before that he owned a farm and an orchard in Richland county. All of this orchard, except one row, was in sod as was the fashion then and now in Richland county. This row, cherries, bore exceedingly well even in off years. The Hatch cherry orchard at Sturgeon Bay has always been cultivated. Make another mark for judgment and observation.

He was a tree peddler once, about thirty-five or forty years ago, out in the Kickapoo country. The trees he sold are alive yet and bearing the kinds of fruit he said they would bear. Make another mark for honesty.

If you should follow closely the life of this man you would have your slate covered with marks. Briefly, it is this: He has made the best possible use of all of the faculties with which nature endowed him to the end that he ranks today one of the leading horticulturists of the United States. Electing the business of fruit growing for a life work, he put into it hard work, hard study and integrity. Such things seem to pay in the end. Is there any young fellow within sound of the scratch of my pen who is cussing his "luck"? A. L. Hatch never met anything that weaker men call "good luck." If old man Bad Luck came his way he kicked him into the street.

We suspect that he was the son of poor, but honest, parents. We hope so. He is somewhere between forty-five and seventy years of age, it's immaterial; horticulturists never grow old.

In 1872 he joined the State Horticultural Society and has been one of its most helpful members ever since. From his "Observations of a Novice" at the 1874 convention at Madison, we will quote the following and then quit:

"There is no nobler employment of the human heart than home-making. Of all home attractions none are purer or more cheering in their tendencies than those offered by horticulture."

A MINNESOTA WINTER.

To the Editor:—In spite of the muskrats we have had a fine winter. They were reported last fall, in November, with houses very high. One report was seven feet high and fourteen feet long, with great thickness. Well, we have had here at Minneapolis thirty-five to forty inches of snow since December 15th. The thermometer two days in December reached zero, in January eighteen days below zero and the coldest being 30 degrees below. In February ten days below and the other ten days has been trying to clean out the snow and spoil two months of good sleighing. Ten years ago I spent a much more disagreeable winter in Los Angeles, California, than we have had here this year. While the cold has been steady and severe at times, we have had very few storms with high winds. Further north and west they report the worst of snow blockades and the thermometer away down to 58 degrees below zero; shortage of fuel and much suffering also reported.

George J. Kellogg.

INVITATION TO SHEEP RAISERS.

To the Editor:—The Wisconsin Sheep Breeders' Association extends a cordial invitation to all farmers and breeders of the state interested in the growing and breeding of sheep to join our association, as we would like to swell our membership to 1,000 if possible, as you know in union there is strength. The association has secured the passage of a dog law at the last legislature, so this will be an incentive for some farmers to start small flocks of sheep, who have hitherto been afraid of doing so on account of dogs. We also intend to publish a pamphlet containing the names and addresses of all paid-up members, together with the breeds of sheep each member handles, and also setting forth the reason why Wisconsin is so well adapted to sheep husbandry.

There is hardly a farm in Wisconsin but what could carry a small flock of good sheep at a profit, with wool now at 35 cents and fat lambs selling at $11.50 per hundred. What is more profitable?

The world is short of good mutton sheep and it will take a long time to overcome this shortage, as the temptation to market ewe lambs is very great when the present prices prevail, and the western ranges are being cut up into farming lands and no increase can be had from the west.

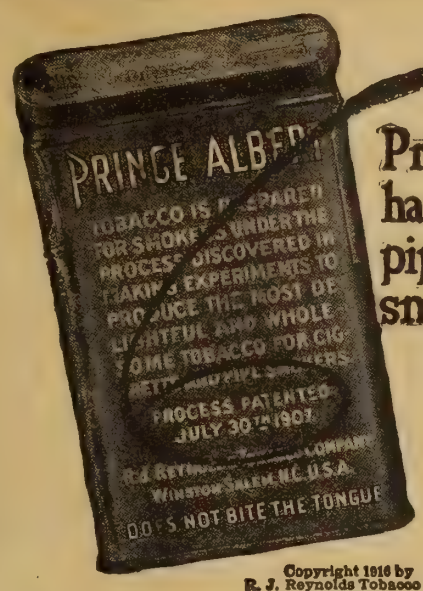
It only costs 50 cents per year to belong to this live organization and if any one is in doubt about Wisconsin producing good sheep, he should come to the Wisconsin State Fair next fall and see the exhibit of sheep that are bred and owned in Wisconsin.

W. F. Renk,
Sec. Wis. Sheep Breeders' Assn.

[Editor's Note.—The Wisconsin Sheep Breeders' Association is worthy the support of all Wisconsin sheep men and we would advise our readers to get in touch with Mr. Renk, the new secretary.]

The Best in Twenty-one Years.

FOR twenty-one years J. S. Gilcrest, president of the Des Moines Incubator Co., has been making offers on "Successful incubators and brooders that have won the approval of thousands of customers, but on page 24 he announces that he is making one this year that beats all others he ever made. With Successful incubators and brooders goes a free course in poultry raising that insures the success of any buyer. His advertisement also describes "Successful" grain sprouters that insure green feed the year around and makes the hens lay in winter. It changes a bushel of oats into three bushels of green, fresh feed. For free catalog write to J. S. Gilcrest, Pres., Des Moines Incubator So., 380 Second St., Des Moines, Iowa. If you wish his valuable book "The Proper Care and Feeding of Chicks, Ducks and Turkeys" enclose 10 cents extra. When writing reference to this paper will be appreciated.—Adv.



Prince Albert tobacco has made three men smoke pipes where one smoked before!

Copyright 1916 by R. J. Reynolds Tobacco Co.

Your supply of Prince Albert awaits your cheery nod at the nearest store that sells tobacco. Toppy red bags, 5c; tidy red tins, 10c; pound and half-pound tin humidors and that fine crystal-glass pound humidor with sponge-moistener top that keeps the tobacco in such excellent condition.

PUT fire to that friendly old jimmy pipe of yours or to a makin's cigarette that's all chock-full of Prince Albert—if you want to know *why* the national joy smoke has revolutionized pipe and cigarette rolling pleasure; *why* Prince Albert has trebled the number of pipe smokers in six years!

Test out P. A. to the last ditch! Puff your way into that enticing flavor, fragrance and long-burning coolness. Your confidence will never be abused. The patented process fixes that—and *cuts out* bite and parch!

PRINCE ALBERT

the national joy smoke

will *set free* any pipe-shy tongue! It will give *any* man *all* the pipe happiness and makin's happiness he ever yearned for!

Prince Albert has won its way on merit; won-over men of all tastes—it's so universal in its popularity; so good, so kindly, so satisfying. *It will win you quick as a flash!*

DAIRY

DAIRY MEETING AT SPARTA, WISCONSIN.

Western Wisconsin farmers and dairymen held a love feast at Sparta, Wednesday, February 16th, which will be remembered as one of the most interesting and enthusiastic gatherings ever held in that part of the state. The meeting was held under the auspices of the Sparta Advancement Association and more than 250 farmers and dairymen were present.

The gathering brought together the members of the three breeders' organizations in that vicinity—the Western Wisconsin Holstein-Friesian Breeders' Association, the Monroe County Guernsey Breeders' Association and the Monroe County Jersey Breeders' Association. Each of these associations held its annual business meetings on that day and the members of each attended jointly the general exercises arranged with the assistance of the Sparta association. This association includes business men and farmers interested in the advancement of dairying and general farming conditions.

The meetings were held in the city building and dinner was served at noon free of cost by the Sparta Advancement Association. This kind of co-operation between the business men and farmers is certain to win in the end and those who aided in the entertainment of the visitors are entitled to much praise and commendation for their work. Following the afternoon program a vote of thanks was extended by the farmers and dairymen to the advancement association for its part in making the meeting successful.

The forenoon meeting opened with an address on "Improvement in Live Stock in Wisconsin," by George McKerrow, of Pewaukee, who told of the benefits from co-operation in Waukesha county. This address was followed by music and addresses by John B. Irwin, of Minnesota, who spoke on "The Dairy Cow for Profit." Mr. Irwin is the owner of the world's champion cow, Duchess Skylark Ormsby, and his experience with profitable cows enabled him to speak first hand regarding this subject. He spoke on feeds and feeding in relation to the profits and cited his champion cow as an example of the dairy cow for profit. The well-fed cows, he said, are as a rule the heaviest and best producers, but proper feeding is just as essential as heavy feeding. He discussed the balanced ration and every dairyman who heard him went home feeling that he had improved his time.

Following dinner each association held its annual business meeting and at 3 o'clock J. L. Tormey, of Madison, spoke on "Co-operation Among Breeders." Four reasons may be assigned, he said, for the great advancement of the dairy industry in Wisconsin: First, the Babcock test; second, the separator; third, the educational work of the farm papers; fourth, co-operation and association work.

Mr. Tormey pointed out that 108 of the 111 community breeders' associations in Wisconsin are dairy organizations and that the dairymen have taken the lead in co-operative work. He cited the success that the Waukesha associations have enjoyed as illustrations of successful and profitable co-operation.

Ford J. Allen, general dairy agent for the North-Western Railroad, spoke briefly upon the desire of the railroads to co-operate in every way possible in building up the dairy industry and said that great progress had been made in western Wisconsin in the last few years.

Charles W. Humble, official tester for the Sparta Co-operative Cow-Testing Association, reported on the activities of the association which closes its first year March 7th. During the year twenty-three farmers have been testing their cows and in January there were fifty-six cows in the association which gave more than forty pounds of fat.

The Western Wisconsin Holstein Friesian Association, which comprises the counties of Monroe, La Crosse, Trempealeau, Vernon and Jackson, elected Charles Vander Schaaf, of Sparta, president; E. L. Little, of Onalaska, secretary, and L. M. Compton, of Tomah, treasurer.

The Monroe County Guernsey Breeders' Association elected Gotham Liddle, of Sparta, president; W. H. Hanchett, of Sparta, secretary, and John Blackburn, of Sparta, treasurer. The Monroe County Jersey Breeders' Association reported a fine year with an increased interest in Jerseys and elected officers for the coming year.

RIGHT START TO SECURE HIGH-TESTING CREAM.

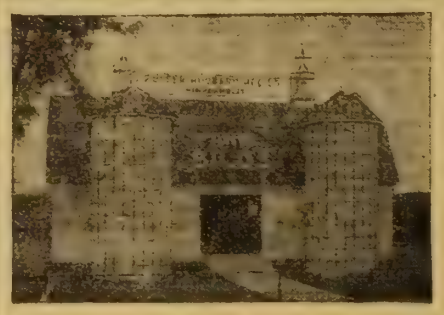
The River Falls Co-operative Creamery, Pierce county, at its annual meeting recently adopted a resolution that should be of great value to that creamery in producing better butter and also of value to the farmers in increasing their profits.

This resolution provides that on and after April 1st all cream received at that creamery which tests less than 25 per cent fat will bring 2 cents less per pound than the general price paid during the month for cream.

In other words, this means that the farmer who skims thin cream with less than 25 per cent fat will receive just 2 cents less per pound for his fat than the farmer who skims and delivers cream testing 26 or more per cent. Several other creameries, we are informed, have taken action with the view of compelling their patrons to skim only high-testing cream.

This is certainly a move in the right direction. There will no doubt be numerous complaints from many patrons of the River Falls creamery. Many will call it an unjust action and it remains to be seen whether the resolution is enforced to the letter. It is a move to compel the farmer to keep his skim milk on the farm instead of carting thousands of pounds of this valuable food to the creamery every year

A FINE WISCONSIN SHOW HERD.
Owned by Joe Gordon & Sons, Mineral Point, Wisconsin.



Minneapolis Panel Silos — Built of Steel and Wood

Cannot collapse when empty, rest uniformly on foundation, no tightening of hoops. Mechanically, scientifically, structurally correct.

New 1916 drain joint means longer life because seams and joints are always dry.

in his cream cans. It is a move to save the farmer a large loss in fat that occurs in buttermilk when cream is thin. It is a move to compel the farmer to feed this skim milk which is now worth about 40 cents a hundred, for if he keeps it on the farm he is pretty likely to feed it to his calves, his pigs or his chickens. It is a move to save the farmer considerable transportation expense in hauling thin cream, to save the creamery the cost of handling so much bulk and also enable the creamery to produce a better product at less expense. Recently it was shown that the farmers, by delivering thin cream to the Tomah creamery lost $10,000 last year. At every creamery there is this loss, the amount depending upon the average cream test which governs the amount of skim milk the farmer throws away by hauling to town.

The quality of cream has everything to do with the prices which the farmers receive for their fat. Some Wisconsin creameries last year paid an average of 36 cents for the year, but most creameries paid 30 cents. Some received from 2 to 4 cents more for their butter than others, all due to the fact that good, clean wholesome cream, high in test, was delivered to the buttermaker. It is not difficult to skim cream testing above 25 per cent, the minimum set by the River Falls creamery. Every dairy farmer can do this and should do it and no doubt more creameries in the future will be making such regulations. Cream testing between 30 and 40 per cent should be the ideal of every farmer and it should be properly cooled and kept so that it can go to the creamery in the best condition. Good, pure, sweet cream, high in test, is necessary if butter commanding the highest prices is to be made and it is the duty of the farmer to the buttermaker to deliver such cream. Then he can expect the prices that top the market and if he doesn't receive them he has a kick coming against the buttermaker.

FOX RIVER VALLEY HOLSTEIN BREEDERS.

To the Editor:—The Fox River Valley Holstein Breeders' Association held its annual meeting at Neenah, Wisconsin, January 27, 1916, and owing to the bad weather there were only twenty-five members present.

The following officers were reelected: President, R. J. Schlafer, Appleton, Wisconsin; secretary and treasurer, Edward O. Mueller, Appleton, Wisconsin.

The following executive committee was chosen: Archie Calder, Allerville, Wisconsin; Fred Zeigler, Appleton, Wisconsin; Charles Carpenter, Hortonville, Wisconsin.

We have the honor of being placed on the Outagamie County Community Institute for a Holstein meeting which is to be held February 28 to March 1, 1916, at Appleton, Wisconsin.

It was voted that the members of the Fox River Valley Holstein Association who have also been appointed to serve on the agricultural committee of the community institute to be held at Appleton, act with the president of the association in arranging for that part of the program.

The president and secretary were instructed to endeavor to arrange for a banquet on the date of the Holstein meeting. It was voted that the president and secretary draw up a resolution to be sent to the officers of the Wisconsin Holstein Breeders' Association, who are to instruct their secretary to mail to every national member in the state of Wisconsin a proxy which shall be returned to the delegate elected to attend the annual meeting of the Holstein-Friesian Association of America. This is for the purpose of getting the Wisconsin Holstein breeders better organized and holding their own proxies. Heretofore the most of the Wisconsin proxies were held by eastern breeders.

It was voted to hold a picnic this coming summer.

Edward O. Mueller.
Outagamie Co., Wisconsin.

WAUSAU COUNTY REPORT.

The Wisconsin Farmer is in receipt of a letter from Otto J. Kilian, of Wausau. He reports that the yearly receipts at the Taegesville cheese factory amounted to 1,078,795 pounds of milk, out of which 104,748 pounds of cheese were made. This is an increase of 156,176 pounds of milk received and 16,758 pounds of cheese made. The farmers received $12,886.18 for the milk delivered.

"Natco on the Farm"

—that's the title of our new free book on hollow tile for farm buildings. Send for it. Before you figure on another building, read it carefully; study its illustrations and plans. Natco buildings cost a little more than frame buildings, but the first cost is the last cost—no painting or repairs. They cost less than other forms of permanent construction, and are easier to erect. You'll be convinced that for permanency, safety, health, convenience and attractiveness, you should

POULTRY DEPARTMENT

THIS department is edited by a competent poultryman, who will be pleased to answer questions concerning disease, poultry management, etc., when they can be answered through the department. Questions will not, however, as a rule, be answered by mail, and stamps need not, therefore, be inclosed with inquiries. Address all letters relating to poultry topics to this office.

POULTRY HINTS FOR THE FARMER.

To the Editor:—I wish to give a word for Mr. Halpin for his able service in poultry. Mr. Halpin is an authority on poultry and we are very fortunate in securing such a prominent poultry man for the old "Badger state."

To begin with, if you have a flock of poultry and they are scrubs just stop and consider the profits you are deriving from them. The recent census gives the average per hen of seventy eggs per year, while the egg contests at Storrs and Mountain Grove have produced a great number that have passed the 200-egg mark and then some. Wouldn't it be a grand thing if you could double your egg yield in one year's time and produce these eggs when the market was the best?

Well, the average farmer could very nearly do this and at a very small expense at that.

If you are carrying scrubby stock don't breed from such! Here we have poultrymen advertising fancy poultry, thoroughbred utility stock and eggs. Here we have a poultry farm at the

A PRIZE PULLET.

First prize White Plymouth Rock pullet at 1916 Chicago Show. Bred and owned by Charles H. Conway, Terre Haute, Ind.

university which breeds all important varieties of the choicest farm and egg-laying strains. Wouldn't it be best to purchase some eggs or stock from some of these breeders and raise something that will be your foundation stock for another year? An outlay of a few dollars is all that is required and you are not spending that, you are simply investing it.

How much does it take to make the same changes with your cattle and hogs? Still the poultry business is paying more for the amount that is invested than any other live stock on the farm.

Let us assume that you have thoroughbred stock and are prepared for raising some good offspring. The main thing is keeping the breeders healthy so a large per cent fertility is derived. Keep at least six inches of straw in your poultry houses and feed your grain in this. If you want an output of eggs try this simple method: Morning feed oats in litter, being careful that you don't give too much. The idea is to keep them hungry through the day and the evening ration is supposed to fill them. Supposing you feed a six-quart pail of oats in the morning; at noon give table scraps, greens (cabbage or forkful of clover chaff) and about three quarts of wheat. For evening feed corn on cob (broken in half) and let them exercise by picking it off. Use judgment and feed enough corn so as to fill them, but just what they pick up clean. It is far better to have them looking for more than to overfeed. Two handfuls a day is sufficient for any bird and in feeding gauge your amount by this.

Now don't forget the hoppers for the dry feeds. A good many poultry-

Wisconsin Wins In Big Hatching Contests Every Year

Why Pay More

For only $10 you can get these two prize winning machines, delivered, freight paid east of the Rockies. You take no risk—money back if not satisfied. You can order direct from this ad. Ask the publisher about us.

Both Machines Freight Paid For Only $10

We also furnish 180 Egg Incubator and 180 Chick Brooder both for only..$12

Wisconsin Incubators have long proved their wonderful hatching qualities. Competing with every make known, they won in the five big annual National Hatching Contests. Think of it. Five consecutive victories. That certainly proves you can't make a mistake. Shipped on 30 Days' FREE Trial

MONEY BACK IF NOT SATISFIED

10-YEAR GUARANTEE

Wisconsins have hot water heat, double walls, double glass doors, copper tanks and boilers, self-regulating. Nursery under egg tray. Made of finest, select, clear CALIFORNIA REDWOOD, not pine, paper or other flimsy material. Incubator finished in natural color—not painted to cover up cheap, shoddy material. Incubator and Brooder shipped complete with thermometers, egg tester, lamps, everything but the oil. This is the best outfit you can buy. If you don't find it satisfactory after 30 days' trial, send it back. Don't buy until you get our new 1916 catalog, fully describing this prize winning outfit. WRITE FOR IT TODAY. You can't make a mistake in buying a Wisconsin. On the market 15 years.

WISCONSIN INCUBATOR COMPANY, Box 102 Racine, Wis.

men feed a moist mash at noon, but I think that it is far better to let the birds mix their own mash. Some birds desire this, others more of the other, and, therefore, they balance their own rations.

In making the hoppers have at least four compartments or sections to it.

A PRIZE COCKEREL.

Second-prize winner White Plymouth Rock cockerel class, at Chicago Show, 1916. Owned by Charles H. Conway, Terre Haute, Ind.

Keep bran, middlings, grit and oyster shells (one-half of each) and charcoal (regulates digestive organs). The four named are very important and you cannot expect to produce results without them. Then look at the economy derived from feeding ground feeds. Bran and middlings cost from $1.15 to $1.40 per 100 pounds, while oats, wheat, etc., cost considerably more. Yes, by the hopper system you introduce a cheaper food that is very nutritious. Meat must also be furnished, especially when confined. This can be fed also in hoppers if beef scraps (commercial) are fed. Or untrimmed bones can be hung up and the birds will pick them clean. The birds also get considerable exercise from the latter method.

This formula is as simple as anyone can make it and you certainly get good results. We read of methods that call for everything, such as mixing of mashes and feeding at noon, sprouting oats, etc. Now, very few farmers have time for such and it takes skill in feeding same. The oat sprouting is one of the greatest achievements in poultry work, but cabbages, lawn clippings, etc., serve the purpose of summer conditions and the work is hardly noticeable.

The writer has seen coops (good number at that) without a straw in it. The corn lays plentifully on the floor and the birds jump down in the morning, fill up and then hop back on the perch, or mope around in the corners. Do you wonder they don't lay eggs? They simply can't under such conditions. There is no exercise and the birds are lazy fat. The one ration of corn does not go far in making an egg. A hen is simply a machine for producing eggs. You cannot feed fatty foods and expect to get albuminous back. It takes wheat, oats, etc., to make the albumen (white of egg); corn and barley for the yolk. Then don't forget oyster shells for the shell and grit for grinding the food. How simple it is, but how many follow it?

The writer is going to deal with a topic that is one of the greatest draw-

FOR SALE—Prize-winning, full blooded Buff Orpington cockerels. Address Mrs. H. Hardwick, Route 1, Edgerton, Wisconsin.

backs in poultry, namely, lice and mites. It is surprising to hear how people get these confused. You will hear them say, "That house is full of chicken lice!" It is not; it is full of mites! Lice are entirely different from mites and they, therefore, must be treated differently. A louse stays on the fowl and lives from the skin, gnawing the surface and producing scales and sometimes sores. The skin becomes scabby in severe cases and a glance at the bird will show whether lice are present. The best remedies and the ones best known are powders. They all require time and cost considerable. The writer uses licene, an anointment which is very effective. One application the size of a pea is sufficient for six months' time. It must be put directly below the vent or anus, as all lice sap at the vent and in crawling through the anointment they perish.

For mites, the most dreaded of all, is required a different treatment. These pests are hidden in cracks, under perches and nest boxes, etc. At night they attack the fowls and sap the blood. When full (blood) they appear red; otherwise they are a grayish color. These are the fellows that crawl on your hands and clothes while in the poultry house.

Make your raid on them about the first of May, as then they are not as numerous as later on when warm weather arrives. Get some kerosene, tar (roofing tar is good) and some crude carbolic acid. Mix the three in the following proportions: Kerosene, 60 per cent; tar, 30 per the sulphur touches the coals the fumes arise and the attendant must make his escape. When you think everything is destroyed within open the doors and windows and air the coop. Then proceed with your mixture and paint as stated. By using sulphur the attendant is relieved of being pestered while performing the work. We all know how it feels to be full of mites.

In closing I wish to state that there are other very important items that I have not dealt upon (1) kind of houses, (2) breeds of poultry, (3) raising chicks, etc. They are important, but it depends upon the man behind.

The three referred to and written about I consider very important, especially to the farmer: First, good foundation stock (breed you desire); second, feeding variety egg-producing foods; third, keeping down the lice and mites.

One is just as important as the other. Good stock with poor care and houses makes a very slight improvement. Good food with lousy and mite-infested birds and houses makes a poor showing. If you will practice cent; crude carbolic acid, 10 per cent. Mix thoroughly so the tar is entirely dissolved. Take an ordinary paint brush and proceed, painting nests, perches, etc., any place where you think mites are present. It is one of the cheapest solutions obtainable and the tar and carbolic acid makes a very strong coating of black that penetrates the wood. Do this at least twice during the warm weather and you will not be bothered with the pests. The interior of the house should be whitewashed in the spring making the coop light and sanitary.

For places already alive with mites try the following: Close up all openings so that the coop is perfectly tight. Take two or three pounds of sulphur and throw over a pan of red coals, having a large pan with water in under the small one. The moment what is given you will be surprised at the results obtained and they are so simple. Paul Johnson.

Dane Co., Wisconsin.

LIKES LARGE INCUBATOR.

To the Editor:—I am very much interested in poultry and raise large numbers of chicks each year. At first I tried setting hens, and I could not get a big enough bunch of little chicks at once, so my husband decided to buy an incubator, a 240-egg machine, at $25. I have had it and run it for two seasons. Now a friend of mine has bought a 400-egg machine that she likes and claims it hatches equally as well as a smaller machine, so I am getting the same idea, to get a 400-egg incubator of that kind and sell mine.

Some claim that a small incubator is the safest. Not for me. I want it large, as I aim to raise between 800 and 900 young Plymouth Rocks this spring. I raised a large number last year and kept an account of what they cost me and what they brought me and I find that there is money in poultry, especially in winter when we can bring plenty of fresh eggs to the market at 35 and 40 cents per dozen, to which I suppose all poultry raisers will agree with me. M. H. E.

Having passed the 50,000 mark in silos and the 80,000 mark in automobiles, Wisconsin is looming up as a state where the farmers not only make big profits but are willing to invest these profits in equipment which will add to returns and give greater pleasure and comfort. There is now a silo to about every third farm in this state and the automobile ratio is nearly as high.

CONKEY'S ROUP REMEDY cures your hens. A good preventive too. 50c postpaid. Conkey Co., Cleveland, O.—Adv.

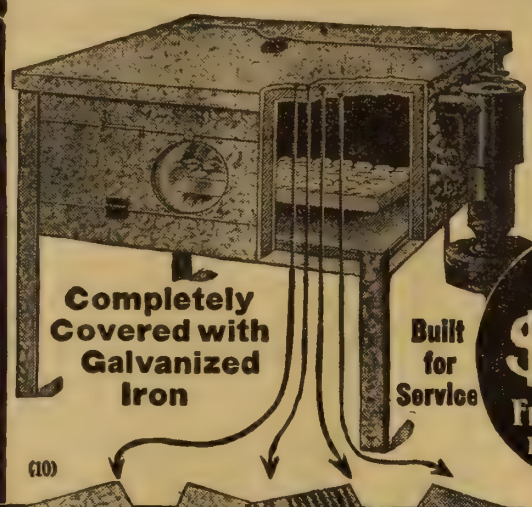
Tells why chicks die

E. J. Reefer, poultry expert, 4483 Farmer Bldg., Kansas City, Mo., is giving away free a valuable book entitled, "White Diarrhoea and How to Cure it." The book contains scientific facts on white diarrhoea and shows how to prepare a simple home solution that cures this disease over night and actually raises 98 per cent of every hatch. All poultry raisers should certainly write Mr. Reefer for one of these valuable FREE books.

Ironclad TRADE MARK

Wins in the Two BIGGEST HATCHING Contests Ever Held

Why take chances with untried machines when for only $10 we guarantee to deliver safely, all freight charges paid (East of the Rockies) BOTH of these big prize winning machines fully equipped, set up ready for use? Why not own an Ironclad—the Incubator that has for two years in succession won in the GREATEST HATCHING CONTESTS EVER HELD? In the last contests conducted by the Missouri Valley Farmer and Nebraska Farm Journal, 2,000 Machines were entered, including practically every make, style and price. With 140 Egg Ironclad—the same machine we offer with Brooder, freight paid. for only $10, Mrs. C. F. Merrick, Lockney, Texas, hatched 148 chicks from 148 eggs in last contest.



Both for $10 Freight Paid East of Rockies

We Give 30 Days Trial —Ten Years Guarantee

You have nothing to risk. We will send machines—let you use them 30 days—urge you to compare them in quality of material, hatching ability, workmanship and price—and if you don't find them satisfactory, send them back—we'll pay the freight charges and return your money. You are absolutely safe. We have to do as we advertise. If we didn't the publishers of this paper would not carry our advertising.

140 EGG INCUBATOR CHICK BROODER

When an incubator is constructed of material of this kind it gives you the strongest and most durable incubator that can be made—a machine that will not warp or shrink, or open up at the seams, as every joint is lapped over with our galvanized iron covering—giving you a machine that will last a life time. Don't class this big, all-metal-covered dependable hatcher with cheaply constructed machines. Ironclads are not covered with tin or other thin metal and painted, like some do to cover up poor quality of material. Ironclads are shipped in their natural color—you can see exactly what you are getting. Don't buy any incubator until you know what it is made of. Note these Ironclad Specifications: Genuine California Redwood, triple walls, asbestos lining, galvanized iron covering. Galvanized iron legs, large egg tray, extra deep chick nursery—hot water top heat, copper tanks and boilers, self regulator, Tycos Thermometer, glass in door, complete book of directions, and many other special features fully explained in free catalog. Write for it today or order direct from this advertisement and save time.

UPPER WISCONSIN

A SOLUTION FOR THE CUT-OVER LAND PROBLEM.

To the Editor:—I have been intending to write to your paper for some time along lines that seem to me are of vital importance to the development of this state and other states possessing a large amount of cut-over timber land.

It is a well-known fact that any man who takes hold of a tract of forty or eighty acres of cut-over land and endeavors to put it into a state of productivity has a very large job on his hands, especially when he has limited capital. Every year there are a great many men who fail at the difficult undertaking. Only foreigners who are used to being deprived of every comfort and convenience seem to be able to make a partial success on the cut-over timber land tracts. And yet the state of Wisconsin has thousands and thousands of acres of this land, which, when once cleared, will be trebled in value and become very productive. Under the circumstances would it not be wise for the state to undertake to clear up land for settlers at, say, $20 per acre, and assess the property for twenty years? Let us assume that a settler had purchased eighty acres of land at $25 per acre, none of which was improved; that he could apply to the state to have twenty acres of this land cleared up at $20 per acre, or $400, the state to assess the property for twenty years at $20 per annum, with interest; that the state would establish a board of experts to look after the work and experienced land clearers would submit bids to this board for clearing certain tracts of land. These contractors should have not only experience in this line of work, but all the necessary equipment, tools, machinery and trained men to make a quick and good job of clearing. The state could authorize bond issues to carry on this work, and, as the credit of the state is very high, money could be borrowed at around 4 per cent on long-term bonds. By this method many thousands of acres of cut-over land could be brought into cultivation. In many counties the assessed value of lands would be doubled and the tax returns to the state multiplied.

At present, some farmers hesitate to come into Upper Wisconsin from adjoining states and tackle a cut-over land proposition, but by the state offering to clear up lands as above described thousands of new settlers would instantly take up the land. I have been all over the northern cut-over land belt and can say that the above method seems the most effective method for getting settlers who can stay and make a success of the venture on these vast tracts of cut-over land.

Cut-over land in this northern country is worth from $10 to $30 per acre, but farms of eighty acres with house and barn, and twenty or thirty acres cleared, are worth from $75 to $100 per acre. Would the state lose anything by clearing such land up and making the community more prosperous?

If $5,000,000 were spent each year by the state in clearing up stump land for actual settlers, at the average cost of $20 per acre, there would be 250,000 acres cleared up each year, which would result in thousands of new settlers, millions of dollars' worth of improvements and a big increase in the productiveness of the communities so improved. Five million dollars spent in this manner for ten years would virtually eliminate the cut-over land from this state and increase the population and productivity many-fold.

The plan that I have outlined is the method used for all civic improvements, such as sewers, waterworks, paving, sidewalks, bridges and roads in cities or counties. It merely means doing the work on a large scale and in a scientific manner and spreading the payments over a long term of years.

Prentice, Wis. W. H. Hull.

Saves a Team
Attachments For Any Binder

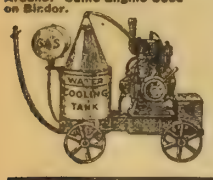
4 H. P. Cushman on a Binder. Same Engine Does All Other Farm Work.

Cushman Binder Engines

For All Farm Work

This is the one successful binder engine. Thousands are in use every harvest. **Fits any binder.** Engine drives sickle and all machinery. Since horses have only to pull machine, two horses will easily handle 8-ft. binder in heavy grain. In a wet harvest Cushman Engine **saves the crop,** as it keeps sickle going when bull wheel slips—it never clogs. **After harvest Cushman engine does all other work.** Very light weight and easy to move around, yet runs more steadily than most heavy engines, because of **Throttle Governor and perfect balance.** **4 H. P.** weighs **only 190 lbs.;** when stripped for binder only 167 lbs. 8 H. P. only 320 lbs. Forced water cooling system prevents overheating. Equipped with Friction Clutch Pulley.

Iver A. Madson, Wheatland, N. D., writes: "I have six engines and the **Cushman is the best.** It does not jump like a heavy engine. On the binder it is a great saver of horse flesh. It will do all you claim and more too."



4 H. P. Truck—Easy to Move Around. Same Engine Used on Binder.

E. W. Gasser, Sidney, Ill., says: "With a Cushman I cut 10 acres more a day with less horses. A binder will last 3 or 4 years longer with this engine." Ask for free Engine Book.

Wisconsin demonstrates that the best way to solve the rural credit problem is to show rural prosperity.

The Quaker Says:—

"Put Thy Faith in Lewis'"

He knows that the lye with the reputation is the lye that discriminating housewives should select, for general cleaning about the house, for water softening, for making soap.

About making soap—do you realize that home-made soap is easy to make and an extraordinary economy? Would you like to save money? Soap made at home with

Lewis' Lye

The Standard for More Than Half a Century

costs less than half as much as the cheapest commercial soaps and it gives perfect cleansing results.

Lewis' Lye entirely saponifies the grease in home-made soap. It *always* does it because it is *always* the same. Every can of Lewis' Lye is of the same superior quality as every other can—always and anywhere.

Ask your mother. The chances are she used it when she was a girl and does yet.

HEPSEY BURKE--A Sister to David Harum

By G. N. Wescott, the Brother of the Author of "David Harum."

(Copyright 1915.)

SYNOPSIS.

Hepsey Burke with the Junior Warden met the new pastor, Donald Maxwell, at the depot, giving him a welcome to his new parish. During the ride out to Thunder Cliff, Hepsey's home, she gave Maxwell in her outspoken way a very clear idea of the requisites or, as she put it, what the "parish wanted in the shape of a pastor." Having arrived at Thunder Cliff, Maxwell settled himself in the room assigned to him and then while resting read a letter from "Betty." However, he decided not to tell Mrs. Burke of her just yet. The new pastor's first call was upon the Senior Warden, receiving a hearty welcome from Virginia Bascom, his daughter. Hepsey surmised that Maxwell was engaged and made a neighborly call upon Jonathan Jackson, the Junior Warden, to see what he thought about the matter. The ladies of the parish gave a missionary tea, at which Virginia read a paper feeling that she was thereby gaining the much desired attention of her pastor.

CHAPTER VIII.

An Icebox for Cherubim.

AS WE have seen, when Maxwell began his work in Durford, he was full of the enthusiasm of youth and inexperience. He was, however, heartily supported and encouraged in his efforts by all but Sylvester Bascom. Without being actively and openly hostile the Senior Warden, under the guise of superior wisdom and a judicial regard for expediency managed to thwart many of his projects. After each interview with Bascom Maxwell felt that every bit of life and heart had been pumped out of him, and that he was very young and very foolish to attempt to make any change in "the good old ways" of the parish, which for so many years had stunted its growth and had acquired the immobility of the laws of the Medes and Persians.

But there was one parishioner who ever was ready to suggest new ventures to "elevate" the people and to play the part of intimate friend and adviser to her good-looking rector, and that was Virginia Bascom. For some unknown reason "the people" did not seem to be acutely anxious thus to be elevated and most of them seemed to regard Virginia as a harmless idiot with good intentions, but with positive genius for meddling in other people's affairs. Being the only daughter of the Senior Warden and the leading lady from a social standpoint, she considered that she had a roving commission to set people right at a moment's notice, and there were comparatively few people in Durford on whom she had not experimented in one way or another. She organized a Browning Club to keep the factory girls out of the streets evenings, a mothers' meeting, an ethical culture society and a craftsman's club, and, as she was made president of each, her time was quite well filled.

And now in her fertile brain dawned a brilliant idea, which she proceeded to propound to the rector. Maxwell was non-committal, for he felt the matter was one for feminine judgment. Then she decided to consult Mrs. Burke—because, while Hepsey was "not in society," she was recognized as the dominant personality among the women of the village, and no parish enterprise amounted to much unless she approved of it, and was gracious enough to assist. As Virginia told Maxwell, "Mrs. Burke has a talent of persuasiveness," and so was "useful in any emergency." If Mrs. Burke's sympathies could be enlisted on behalf of the new scheme it would be bound to succeed.

As a matter of fact, Mrs. Burke had heard rumors of this new project of Virginia's. It always went against the grain with Hepsey to say: "Don't do it." She was a firm believer in the teaching of experience: "Experience does it," was her translation of the classic adage.

And so one morning found Virginia sitting opposite Mrs. Burke in the kitchen at Thunder Cliff, knitting her brows and poking the toe of her foot with the end of her parasol in an absent-minded way. This was symptomatic.

"Anything on your mind, Virginia? What's up now?" Mrs. Burke began.

For a moment Virginia hesitated and then replied:

"I am thinking of establishing a day-nursery to care for the babies of working women, Mrs. Burke."

Mrs. Burke, with hands on her hips, gazed intently at her visitor, pushed up her under lip, scowled, and then observed thoughtfully:

"I wonder someone hasn't thought of that before. Who's to take care of the babies?"

"Mary Quinn and I, with the assistance of others, of course."

"Are you sure that you know which is the business end of a nursing bottle? Could you put a safety pin where it would do the most good? Could you wash a baby without drownin' it?"

"Of course, I have not had much experience," Virginia replied in a dignified and lofty way, "but Mary Quinn has, and she could teach me."

"You're thinkin', I suppose, that a day-nursery would fill a long-felt want, or somethin' like that. Who's goin' to pay the bills?"

"Oh, there ought to be enough progressive, philanthropic people in Durford to subscribe the necessary funds, you know. It is to be an auxiliary to the parish work."

"Hm! What does Mr. Maxwell say?"

"Well, he said that he supposed that babies were good things in their way, but he hadn't seen many in the village and he didn't quite realize what help a day-nursery would be to the working women."

"That doesn't sound mighty enthusiastic. Maybe we might get the money, but who's to subscribe the babies?"

"Why, the working women, of course."

"They can't subscribe 'em if they haven't got 'em. There are mighty few kids in this town, and if you really want my candid opinion, I don't think Durford needs a day-nursery any more than it needs an icebox for cherubim. But then, of course, that doesn't matter much. When you goin' to begin?"

"Next Monday. We have rented the store where Elkin's grocery used to be and we are going to fit it up with cribs and all the most up-to-date conveniences for a sanitary day-nursery."

"Hm! Well, I'll do all I can to help you, of course. I suppose you'll find babies pushin' all over the sidewalk Monday mornin', comin' early to avoid the rush. Better get down as early as possible, Virginia."

Virginia departed.

After the furnishing of the incipient nursery had been completed and each little crib had a new unbreakable doll whose cheeks were decorated with unsuckable paint, Virginia and Mary Quinn—invaluable in undertaking the spadework of all Virginia's parish exploits—gave an afternoon tea to which all the subscribers and their friends were invited. But when everything was in readiness for patronage what few working women there were in Durford possessed of the right kind of babies seemed strangely reluctant to trust their youthful offspring to the tender mercies of Virginia Bascom and Mary Quinn.

Consequently, the philanthropic movement, started under such favorable patronage, soon reached a critical stage in its career and Mrs. Burke was called in to contribute some practical suggestions. She responded to the summons with all due promptness and when she arrived at the nursery she smilingly remarked:

"Hm! But where are the babies? I thought they would be swarming all over the place like tadpoles in a pool."

"Well, you see," Virginia, her voice quivering with disappointment, "Mary Quinn and I have been sitting here four mortal days and not a single infant has appeared on the scene. I must say that the working women of Durford seem strangely unappreciative of our efforts to help them."

"Well," Mrs. Burke responded, "I suppose day-nurseries without babies are as incomplete as an incubator without eggs. But, after all, it hardly seems worth while to go out and snatch nursing infants from their mother's breasts just to fill a long-felt want, does it? Besides, you might get yourself into trouble."

"I didn't ask you to come and make fun of me," Virginia replied touchily. "I wanted you to make some suggestions to help us out. If we don't get any babies we might just as well close our doors at once. I should be awfully mortified to have the whole thing a failure after all we have done, and all the advertising we have had."

Mrs. Burke sat down and assumed a very judicial expression.

"Well, Ginty, dear, I'm awful sorry for you. I don't doubt you done the best you could. It'd be unreasonable to expect you to collect babies like mushrooms in a single night. All true reformers are bound to strike snags and to suffer because they ain't appreciated in their own day and generation. It's only after we are gone and others take our places that the things we do are appreciated. You'll have to resign yourself to fate, Virginia, and wait for what the newspapers call 'the vindicatin' verdict of prosperity.' Think of all the people that tried to do things and didn't do 'em. Now there's the Christian martyrs——"

For some reason Virginia seemed to have a vague suspicion that Hepsey was still making fun of her, and, being considerably nettled, she interjected tartly:

"I'm not working for the verdict of posterity, and I don't care a flip for the Christian martyrs. I'm trying to conduct a day-nursery, here and now; we have the beds and the equipment and some money, and——"

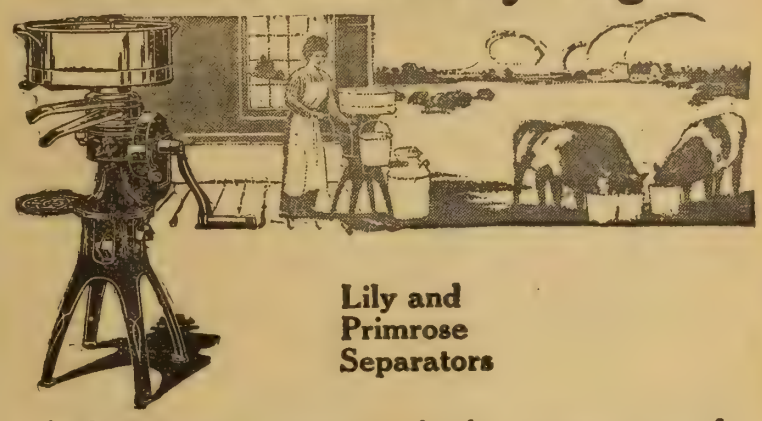
"But you haven't got the babies, Virginia!"

"Precisely, Mrs. Burke. It's simply a question of babies, now or never. Babies we must have or close our doors. I must confess that I am greatly pained at the lack of interest of the community in our humble efforts to serve them."

For some time Hepsey sat in silence; then she smiled as if a bright idea occurred to her.

"Why not borrow a few babies from the mothers in town, Virginia? You see, you might offer to pay a small rental by the hour or take out a lease which could be renewed when it expired. What is lacking is public confidence in your enterprise. If you and

Go Slow and Buy Right



Lily and Primrose Separators

THE cream separator is the center around which every successful dairying establishment revolves. A good separator will add considerably to your cash income. You can't afford to buy at random. If you are not personally acquainted with the best features of the best cream separators, let us help you.

An ordinary separator will save you money, but if you want to make the most from your cream buy a **Lily** or **Primrose**. These **International Harvester** separators work so efficiently and for so many years that even the two- or three-cow farmers use them with profit. Is yours a bigger herd? Then take the advice of thousands of the most prosperous dairymen and buy either a **Lily** or a **Primrose**.

Lily and **Primrose** separators skim very closely—leaving only a drop of cream in a gallon of milk. They are strong and simple, needing few adjustments—which any man or woman can make. The frame on each is open and sanitary. The supply can is large and low. Every bearing and quiet gear is well oiled always by a splash system. There are no better separators.

Buy a **Lily** or **Primrose** from the **I H C** dealer and be sure of satisfaction. Write us for catalogues and booklets on dairying.

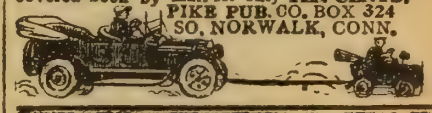
PIKE PUB. CO. BOX 324
SO. NORWALK, CONN.



Miss Quinn could be seen in the nursery windows handlin' a baby on each arm and singin' lullabies to 'em for a few days it'd attract attention, inspire faith in the timid and public confidence would be restored. The tide of babies 'd turn your way after a while and the nursery would prove a howlin' success."

Virginia considered the suggestion and, after deep thought, remarked:

"What do you think we ought to pay for the loan of a baby per hour, Mrs. Burke?"

"Well, of course, I haven't had much experience rentin' babies, as I have been busy payin' taxes and insurance on my own for some years; then you see rents have gone up like everything lately. But I should think that ten cents an afternoon ought to be sufficient. I think I might be able to hunt up a baby or two. Mrs. Warren might lend her baby and perhaps Mrs. Fletcher might add her twins. I'll call on them at once, if you say so."

Virginia looked relieved and in a voice of gratitude responded:

"You are really very, very kind."

"Well, cheer up, Virginia, cheer up. Every cloud has its silver linin'; and I guess we can find some babies somewhere even if we have to advertise in the papers. Now I must be goin', and I'll stop on the way and make a bid for the Fletcher twins. Good-by."

When Nicholas Burke learned from his mother of the quest of the necessary babies, he started out of his own motion and was the first to arrive on the scene with the spoils of victory in the shape of the eighteen-months infant of Mrs. Thomas McCarthy, for which he had been obliged to pay twenty-five cents in advance, the infant protesting vigorously with all the power of a well-developed pair of lungs. As Nickey delivered the goods he remarked casually:

"Say, Miss Virginia, you just take the darn thing quick. He's been howlin' to beat the band."

"Why, Nickey," exclaimed Virginia, and gingerly possessing herself of James McCarthy, "however did you get him?"

"His ma wouldn't let me have him at first, and it took an awful lot of jollyin' to bring her round. Of course, I didn't mean to tell no lies, but I said you was awful fond of kids. I said that if you only had Jimmy it would give the nursery a send-off, 'cause she was so well known and Mr. McCarthy was such a prominent citizen. When she saw me cough up a quarter and play with it right under her nose I could see she was givin in; and she says to me, 'Nickey, you can take him just this once. I'd like to help the good cause along and Miss Bascom, she means well.' Ma's gettin' after the Fletcher twins for you."

James McCarthy was welcomed with open arms, was washed and dressed in the most approved antiseptic manner; his gums were swabbed with boric acid and he was fed from a sterilized bottle of pasteurized milk and tucked up in a crib with carbolized sheets and placed close to the window where he could bask in actinic rays and inhale ozone to his heart's content. Thus the passer-by could see at a glance that the good work had begun to bear fruit.

Mrs. Burke managed to get hold of the Fletcher twins, and as they both howled lustily in unison, all the time, they added much to the natural domesticity of the scene and seemed to invite further patronage, like barkers at a sideshow. Mrs. Warren was also persuaded.

Although the village was thoroughly canvassed, Miss Bascom was obliged to content herself with the McCarthy baby and the Fletcher twins, and the Warren baby, until, one morning, a colored woman appeared with a bundle in her arms. As she was the first voluntary contributor of live stock she was warmly welcomed, and a great fuss made over the tiny black infant which gradually emerged from the folds of an old shawl "like a cuckoo out of its cocoon," as Mary Quinn remarked. This, of course, was very nice and encouraging, but most unfortunate, when night came the mother did not appear to claim her progeny, nor did she ever turn up again. Of course, it was a mere oversight on her part, but Virginia was much disturbed, for, to her very great embarrassment, she found herself the undisputed possessor of a coal black baby. She was horrified beyond measure, and sent at once for Mrs. Burke.

"What shall I do, what shall I do, Mrs. Burke? she cried. Mrs. Burke gazed musingly at the writhing black blot on the white and rose blanket and suggested:

"Pity you couldn't adopt it, Virginia. You always loved children."

"Adopt it!" Virginia screamed hysterically. "What in the world can you be thinking of?"

"Well, I can't think of anything else, unless I can persuade Andy Johnson, the colored man on the farm, to adopt it. He wouldn't mind its complexion as much as you seem to."

Virginia brightened considerably at this suggestion, exclaiming excitedly:

"Oh, Mrs. Burke, do you really think you could?"

"Well, I don't know. Perhaps so. At any rate, if we offer to help pay the extra expense, Mrs. Johnston might bring the baby up as her own. Then they can name it Virginia Bascom Johnston, you see."

Virginia bit her lip, but she managed to control her temper as she exclaimed quite cheerfully:

"Mrs. Burke, you are so very kind. You are always helping somebody out of a scrape."

"Don't overpraise me, Virginia. My head's easily turned. The teachin's of experience are hard—but I guess they're best in the end. Well, send the poor little imp of darkness round to me tonight, and I'll see that it has good care."

As a matter of fact, Hepsey had qualms of conscience as to whether she should not, at the outset, have discouraged the whole baby project; experience threatened to give its lesson by pretty hard knocks, on this occasion.

For, though the immediate problem was thus easily solved, others presented themselves to vex the philanthropic Virginia.

When on the tenth day the rental for the Warren baby and the Fletcher twins fell due and the lease of James McCarthy expired without privilege of renewal, the finances of the nursery were at a very low ebb. It certainly did not help matters much when, towards night, Mary Quinn called Virginia's attention to the fact that there were unmistakable signs of a bad rash on the faces of the twins, and very suspicious spots on the cheeks of the Warren baby. Even the antiseptic James McCarthy blushed like a boiled lobster and went hopelessly back on his sterilized character. Of course, the only thing to be done was to send at once for the doctor and for the mothers of the respective infants. When the doctor arrived he pronounced the trouble to be measles, and when the mothers made their appearance, Virginia learned something of the unsuspected resources of the English language served hot from the tongues of three frightened and irate women. Finally the floor was cleared and the place closed up for disinfection.

Just before she left Virginia dropped into a chair and wept quite oblivious of the well-meant consolations of Mary Quinn sometime co-partner in "The Durford Day-Nursery for the Children of Working Women."

"We've done the very best we could, Miss Bascom; and it certainly isn't our fault that the venture turned out badly. Poor babies!"

At this the sobbing was roused to one last protest:

"Many Quinn, if ever you say another word to me about babies I'll have you arrested. I just hate babies and—and everything! Why, there comes Mr. Maxwell! Say, Mary, you just run and get me a wet towel to wipe my face with, while I hunt for my combs and do up my back hair. And then if you wouldn't mind vanishing for a while—I'm sure you understand—for if ever I needed spiritual consolation and the help of the church it is now, this minute."

(To be continued.)

ROSES! Eight Beauties For 15c!

No Flowers So Fair as Roses: No Finer Roses than The Housewife's

Our 1916 offer is Better and Bigger than any previous group---Splendid and unusual types chosen in well balanced assortment comprising Eight Hardy Beauties in all.

Bigger, Better, Brighter Than Ever

Frau Karl Druschki—A pure paper-white, free-flowering, large-sized Hybrid Perpetual. It is a remarkably handsome plant with bright, heavy foliage and strong, upright growth. There is nothing in the line of perfectly hardy Roses that can compare with this one in form, color and general finish.

Robin Hood—This new Rose has a glorious rosy-scarlet color that is at once soft and bright and lasting; the bloom is full and of beautiful build. It is a grand grower, heavy caned and profuse in foliage; flowers very freely produced; we feel sure this will prove a delightful companion for Rhea Reid.

Rhea Reid—Considered by many experts to be the finest red Rose in existence; has no rival. Rhea Reid is an offspring of American Beauty, which fact alone would place it right in the front rank along with its hitherto unrivaled parent. Much darker and richer red than the American Beauty; fragrant and continuous.

Violet Blue (the Blue Rambler)—the most novel creation of the age. A perfectly hardy, rapid-growing Rambler, identical with Crimson Rambler, except the color of its flowers. The immense clusters of beautiful violet-blue flowers, reminding one at a distance of the Blue Clematis, is a sight never to be forgotten. It is entitled to a place in every garden. It will cover the porch or trellis where planted in a short time, and will succeed everywhere.

Climbing American Beauty—Climbing H. P. A seedling from American Beauty with Wichuraiana and Tea blood in its veins. The introducers say of it: "Same color, size and fragrance as American beauty, with the addition of the climbing habit. Good foliage, and better blooming qualities. One plant of this new Rose will produce twenty times as many flowers in June as the old American Beauty, besides blooming occasionally during the summer. Blooms three to four inches across; has proved perfectly hardly and stands heat and drought as well as any Rose in our collection." We feel sure this Rose has a great future.

White Dorothy. (New)—A pure white sort of well-known Dorothy Perkins, of same habit of growth and freedom of flowering; a splendid companion for the pink variety, as it flowers at the same time. A most valuable addition to this class. Awarded gold medal National Rose Society and Award of Merit, Temple Show, England.

Madame Caroline Testout—Clear bright satiny-pink; flowers very large and extremely showy; quite distinct. It is the Rose par excellence. It does well everywhere.

Marechal Niel Rose—The world-renowned Rose. A beautiful deep sulphur-yellow, very large and exceedingly fragrant. It is the finest yellow Rose in existence. It has a climbing habit.

As an introductory offer—The eight famous roses described in detail above will be sent to any person who subscribes to The Housewife for one year at 50 cents a year, for but 15 cents additional. In other words for 65 cents, you get The Housewife for one year and the roses will be sent you postpaid. THIS OFFER APPLIES UPON ORDERS RECEIVED BEFORE MAY 10TH—IT WILL BE WITHDRAWN UPON THAT DATE AND ORDERS RECEIVED AFTER THAT DATE WILL NOT BE FILLED. Think of it!—Eight beautiful roses for 15 cents! Lose no time in sending in your order—take advantage of this sensational springtime offer at once. There is going to be a lively demand, so the sooner you get your request filed, the better.

OFFER ENDS POSITIVELY MAY TENTH

THE HOUSEWIFE is showing wonderful improvement and the evidences of this are just beginning—the very best fiction, illustrated by work of famous artists are to appear in coming issues.

Look at a few of the many names of those now contributing to The Housewife's pages:

AUTHORS.

Holworthy Hall—Author of Henry of Navarre, Ohio; the "Pepper" stories, etc.

Ellis Parker Butler—Who wrote "Pigs is Pigs;" the Great American Pie Company, etc.

Jane W. Guthrie—Who can tell a love story as few can, which explains her fame.

Lilian Dynevor Rice—Whose special cookery and household columns will be welcomed and—

No end of other features, Mother Knows Hows, Childrens' Pages, Real Poetry, Short Stories, and many big features to be announced from time to time.

ARTISTS.

F. Early Christy, whose cover designs are their own best description; John R. Neill, of whom it has been said, "He more than illustrates a story—he illuminates it;" P. J. Monohan, whose pictures are always full of action and real people; W. B. King, he of the deep understanding and deft touch; the list could be made as long as wanted, both as to artists and authors.

No expense nor time nor trouble is being spared to make

THE HOUSEWIFE

the finest popular priced magazine for women in America.

At any price The Housewife would not be a luxury—at 50 cents a year it is a necessity!

THE HOUSEWIFE, 30 IRVING PLACE, NEW YORK.

THE HOME

LETTERS intended for publication should be accompanied by the name and address of the writer not necessarily for publication, but as a matter of good faith. All communications intended for his department should be addressed to Editor Home Dept., The Wisconsin Farmer, Madison, Wisconsin.

MELY ADVICE FOR THE FLOWER LOVER.

It is none too early to begin planng the garden if you want your ossoms to come early. Such flows as the aster, chrysanthemum, ckscomb, cosmos, marigold, petua, scarlet sage, verbena, Scotch pink, yssum, sweet william and four clock do especially well if started in tbeds or cold frames and, according specialists of the United States Dertment of Agriculture, those who ssess these should lose no time in wing them in such flowers as will desired later for beds.

Of course, some of these, such as yssum, aster, marigold, cockscomb d pink, need not of necessity be arted in hotbeds, as they do quite ell if sown later in the season in e open ground and then transplant- to their permanent locations. Pans, snapdragons, zinnias, mignonette d single dahlias also may be sown this way. However, the seed of ese flowers should not be sown un- the ground is in condition for makg a good seed bed and until there is longer any likelihood of a heavy ost. If you are not sure that the il in the garden is in proper condion to be worked, take up a mass of in the hand and press it into a ball. the ball readily falls apart the round is dry enough to be worked. pade up the ground well, break it up oroughly with hoe and rake and be re that all stones and lumps are moved. Do not ask a flower seed to ow in lumpy, pebbly soil. Have the rface very fine and soft. In plantg each kind of seed follow carefully e directions as to depth of planting. There are a number of flowers the eds of which should be sown in the pen ground or beds where the plants re to remain, as they either die or ow half-heartedly if transplanted. mong these are the California poppy, candytuft, corn flower, forget-me-t, phlox drummondii, sunflower and eet pea.

Sweet peas are probably the most opular of this list. They should be the ground as soon as it is dry ough to work.

The soil should be spaded up and ell prepared and then a trench ould be dug four inches deep; in e bottom of this the peas should be lanted about two inches apart. hen the peas are to be grown over hicken wire or brush truck in the round it is customary to sow them two parallel rows, six or eight ches apart. In this way on the ame amount of trellis double the umber of plants can be grown with atisfactory results. Sweet peas hrive best in a cool, moist climate. ecause of this it is especially deirable to sow very early in the pring.

Poppies may be sown directly on he surface of ground that was preared last fall. If the bed was not repared at that time it should be paded up as soon as the ground is ry enough, and the poppy seed sown venly over surface. The seed should e slightly covered by drawing the ack of the rake over the bed. Care hould be taken to distribute the eed evenly and not in bunches, for f there is much disturbance of the oots at the time of thinning, the plants will not do so well as when eft undisturbed. The Shirley poppy, very showy and attractive variety, nay be obtained in many colors. The ndividual blossoms, however, are very short lived, and as compared with many other plants its blooming season is short. The plants are so ttractive when in bloom, however, hat they are well worth planting. A succession of sowings will prolong he blooming season.

The California peppy should also be own early, but does not require as arly sowing as the other poppies. t is handsome and will bloom during longer period than the Shirley oppy.

Balsams or lady's slippers and castor beans are also best sown where they are to grow, but they should not be put in the ground until it is warm enough to grow beans and tomatoes well—that is, about the time corn is coming up or oak leaves are half grown.

The first sunshiny day that comes, let the mending or the darning or the ironing go over to the morrow and get out of doors with the rake and the hoe and a stout boy or man to manage the spade and the lifting, and start your gardening so that the blossoms you love best will be coming on at the earliest possible moment.

WOMEN FARMERS ORGANIZE.

The Iowa Women Farmers' Association, composed of women who own and manage their own farms, was recently organized. They had been invited to the agricultural college at Ames to meet and listen to a talk by Miss Pearle Mitchell, of Columbia, Mo., president of a similar organization in that state. They heard Miss Mitchell and were so favorably impressed with what she said that they decided to form an association of their own.

The membership of this organization is to be limited to women who own and operate their own farms, and the farms must consist of at least twenty acres.

This is a step in the right direction, and we wish that farm women everywhere whether they are the actual owners of the farm they live on or not would organize into clubs and associations for the purpose of mutual assistance in the problems that daily confront them.

The viewpoint of farm women is changing. Time was when you could hear many a farm woman say she could not take part in anything outside her home because "there was so much work to do." Labor saving devices and better working methods are changing all this, and the drudgery of the farm is almost a thing of the past. And there is no better way of finding out these helpful things than through the efforts of such an organization. Many of these clubs have been organized through the central West and they have not only brought the community together in a social way but through study of home problems have been a great aid to home makers.

Someone has said, "Society today demands service of each individual. Somewhat of oneself one must contribute to the social machinery or be a clog in the wheel." The rural club answers this need.

MOISTURE NECESSARY FOR HOUSE FERN.

Greenhouse men say that special care should be given to the house fern just at this time of year.

To keep the humidity of the room high is the first consideration. The temperature is not of so much importance, but a dry room is a killing room for ferns. The air can be kept moist by placing shallow pans of water around in places where evaporation will take place rapidly. Also keep the fern well watered, but not soaking wet.

The plant mealy bug, a fern insect pest, can be gotten rid of by turning the plant upside down and spraying it with a fairly strong stream of water. The aphis can be killed by washing with nicotine solution. If any insect eggs have dropped down into the soil of the crock it would be well to remove the top inch or two of the dirt and replace it with new soil.

If the ferns were not repotted in the fall it would be well to do it this spring. Leaf mold and rich soil, half and half, make an ideal growing mixture.

DOMESTIC SCIENCE MAKES WARM LUNCH POSSIBLE.

The question of whether or not domestic science should be taught in the rural schools is one that has recently come in for a good deal of discussion. One of the best arguments in favor of the teaching of this branch is contained in a recent communication from Mr. A. R. Arveson, county superintendent of Langlade county, Wisconsin. The schools in this county have only been in operation something like ten or twelve years, but the progress they have made is indeed creditable, and the important place domestic science has taken in the course is of interest to school patrons everywhere.

Work in domestic science is carried on in nearly all of the graded schools in this county and in about 25 per cent of the one-room schools. One hour a week is usually devoted to this work, which is mostly patching, darning and plain sewing. A little fancy work of the most practical value is

LUNCH TIME IN A RURAL SCHOOL.

Mayer HONORBILT SCHOOL SHOES "WEAR LIKE IRON"

PUT your boys and girls into Honorbilt School Shoes and watch how they wear—twice as long as other school shoes, sold at the same price. also taken up by the older girls. The teachers report a great deal of interest on the part of pupils not only in this work but a greater interest in their other work. In some cases, Mr. Arveson says, a marked increase in percentage of attendance. Parents, also, are interested in the work and have been free to express their appreciation.

In connection with this work, the plan of serving warm lunches to the children who carry their dinners is being tried out by several teachers with splendid success. Not only is it a success from a health standpoint, but it presents an opportunity for teaching lessons in domestic science, such as lessons in cooking, serving, cleanliness, table manners, etc.

One grade school has served cocoa, pea soup, bean soup, beef soup, etc. The domestic science class under the direction of the teacher does the serving. Children bring their own dishes. Reports show that the pupils do better work in the afternoon and show a better spirit toward their work. The boys are making a cooking table for the domestic science class.

Another graded school serves a warm dish once a week to the pupils of each room. The work is done by the domestic science class under the direction of the teacher. The school board approves of the plan and it has the hearty indorsement of the people, and especially of those who live a long ways from school. The teacher in charge of this work loses no opportunity for teaching a practical lesson whenever opportunity offers.

Still another school enjoys warm lunches every day which is appreciated by all of the patrons of the school.

Of course, the plan of serving warm lunches requires some effort, but the results obtained in this county are conclusive evidence that it is well worth while and those who are doing it are to be commended for their interest and effort.

HOW DO YOU CAN YOUR STRAWBERRIES?

To the Editor:—I have thought a good many times of writing to the Home Department, as I have received lots of good from it. Would like to have someone give me directions for canning strawberries. Mine are always so strong we do not care for them. I have heard people say they should be as mild as when fresh. Can someone help me out?

Mrs. H. A.

TOO MANY DENOMINATIONS.

To the Editor:—I found in your paper a letter from a reader about uniting with the church, which greatly interested me.

I am a member of the Methodist Episcopal Church. The rules of this church are taken from the Bible. Read it and you will know what is expected. But of what good are rules if they are never lived up to? I would never want to have it on my conscience that I thought only members of a church would be more likely to be saved than those who are not members.

In the gospels which tell of the life and work of Jesus we find nothing about uniting with a church, but only to observe all things which He commanded. We might ask how many church members do that? I know God will be less pleased with a chur member who never does what promises than with a person w promises nothing and lives a goo life.

I firmly believe in an Almighty Go in the Bible as God's Word, in Jesu Christ, and that every human bein is a sinner. I also know that th sooner we acknowledge it to Jesu the sooner will our conscience be peace. But from that hour we mu watch and pray and God's Word mu be used daily for the soul's welfar as food is used for the body.

It seems to me that the greate trouble in Christianity today is tha there are too many denominatio and that the power of God's Word ha been crowded out. We also seem have forgotten that God gave every one a conscience and mind o his own and we rely too much o what others say and think instead o going direct to God's Word and Jesu Christ.

A Believer.

IRONS STAIN THE CLOTHES.

To the Editor:—Can anyone t me what to do with my flatirons They are nickel plated and when begin to iron the clothes they wi leave them all yellow. They do n burn the clothes, but stain. I hav tried all kinds of things to clean the but to no avail. Will be thankful fo any advice.

N. N.

KNOWS WHAT TO DO FOR HEADACHE.

To the Editor:—I can't resist writ ing to you in answer to the lady wh wants relief from headaches. I know just how to sympathize with her, fo I have had the same trouble for years

MRS. E. JETT SENDS US A PICTURE OF HER FAMILY.

But I am not writing to tell her how much I suffered from them but, rather, how I found relief.

I was like everybody else, I would try anything anybody told me about. My whole idea was to get rid of the headaches. It never occurred to me that there must be a reason for them. I am a farmer's wife and have the usual household duties to perform besides three little folks to take care of, so that I could not always (or thought I couldn't) rest when I needed it. The result was that I was run down and didn't give myself a chance to build up again.

Then a friend induced me to try osteopathy. I was skeptical at first but I promised her I would try it. So one day when I went to town one of those headaches came on and I thought that was a good chance to try it. And I did. I came out of that doctor's office just about as skeptical as I went in but, would you believe it, I was hardly a half mile out of town when I suddenly realized that my headache was gone.

Of course that wasn't the last of my headaches. But the next one found me right there where I had got relief from the first one. I learned right there that it was a general upbuilding of my system that I needed and not a "headache tablet" to kill the pain. I began to feel better every way and it isn't very often now that I have to give up to a headache. I have learned, too, that I gain a good deal by resting when I feel the need of it instead of finishing some household duty that I know perfectly well will be there just any time I get ready to do it. Why, sometimes I stop right in the middle of ironing or sweeping or whatever I am doing, put the kid-

dies in the buggy and we all take a ride. The youngsters think it is a lark, and I know my work is lots easier to do when I get back. Just try it once, and for goodness' sake don't spoil it all by worrying if someone catches you with the dusting not done. Mrs. J. D.

THINKS SCORE CARD WOULD HELP.

To the Editor:—The letters and baby pictures printed in your paper are most interesting and helpful to us young mothers. If an official score card used in the baby judging contests were printed it would be a help to mothers also. We could then judge our own babies.

We have an eight-months-old boy, John Anson Rose, Jr. John is the fifth John Rose in a direct line of descent. He weighs seventeen pounds. He is a fresh air baby and has never had any food but mother's milk. I feed him every two hours during the day and twice in the night. He takes his naps regularly during the day. We do not play with him a great deal. He is a good baby all the time.

I hope some of the more experienced mothers will write and tell us their methods. Mrs. V. J. Rose.

TOO MUCH SUGAR.

To the Editor:—In answer to the reader who wants assistance in her cake making will say that I think the reason her cakes fall and are coarse is because there is too much sugar. If your recipe calls for one cup of sugar make it a very scant cup.

Here is a small, white cake recipe which is fine. One scant cupful of sugar, one level tablespoonful of butter whipped to a cream, one-half cupful of sweet milk (or part water), one heaping cupful of flour with a heaping teaspoonful of baking powder sifted with it, one teaspoonful of lemon extract. At the last fold in the whites of two eggs beaten stiff.

Mrs. W. J. S.

APPLE AND CRANBERRY JELLY.

An excellent combination for homemade jelly, according to the home economics experts of the United States Department of Agriculture, is cranberries with apples. Equal quantities of cranberries and apples cut into small pieces should be just covered with water and boiled until the fruit is soft. Strain the juice through cheesecloth. Add to the pulp the same amount of water as at first, boil the pulp a second time, strain as before, and combine the two lots of juice. Add three-fourths as much sugar by measure to the juice and boil again. The jelly is done when a few drops taken up with a mixing spoon will flake on the spoon as it cools instead of dropping from it. Pour the jelly into glasses which have just been sterilized in boiling water and thoroughly drained. Cool the glasses in the ordinary way.

RECIPES.

Bread Pudding.—Three eggs (beaten), one cup sugar, two cups grated white bread, one and one-half teaspoonfuls baking powder, one cup dates, one cup chopped walnuts, one-half teaspoonful vanilla. Bake twenty-five minutes in moderate oven in bread tin. When cold turn out and serve (sliced) with whipped cream.

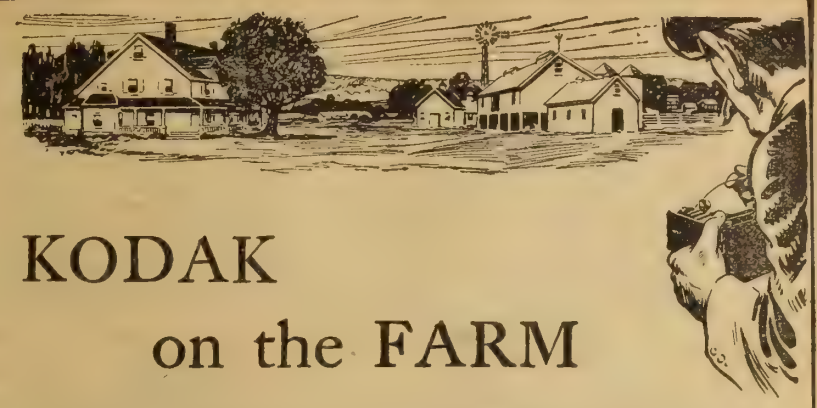
Corn Meal With Raisins.—One cup corn meal, two cups milk, one cup seeded raisins, one egg, two teaspoonfuls baking powder, two tablespoonfuls butter, one teaspoonful salt. Mix corn meal and milk together, and the well-beaten egg and melted butter. Add salt, baking powder and raisins (which have been washed, dried and put through food chopper). Mix all together. Brush pie tins with drippings, pour in mixture one inch thick, bake in moderate oven twenty to twenty-five minutes, or put into iron gem pans and bake twelve to fifteen minutes. Serve warm.

Spareribs.—Trim off the rough edges of two sets of ribs, break the bone across the middle, rub inside with salt, sprinkle with black pepper and dredge with flour. Fill with sauerkraut which has been parboiled twenty minutes. Save the water in which the kraut was cooked, sew ribs tightly, place on rack in roaster, then pour the kraut liquor around it. Cook slowly. Turn once, when tender brown thoroughly. Serve with mashed potatoes.

Prune Puff.—One cup cooked prunes unsweetened, one teaspoonful lemon juice, one cup flour, five level tablespoonfuls sugar, two level teaspoonfuls baking powder, one-fourth level teaspoonful salt, one egg, one-third cup milk, two tablespoonfuls melted butter. Mix the prunes, lemon juice and sugar thoroughly. Place in the bottom of a well-buttered pudding mold. Mix the flour, baking powder and salt. Add the egg and milk mixed together. Pour the batter on top of the prunes. Bake in a moderate oven for twenty minutes. Remove from the pan, cut in squares and serve warm with whipped cream. Of course the prunes must be seeded.

Corn Meal Griddle Cakes.—One cup yellow corn meal, one cup boiling milk, one egg, one teaspoonful baking powder, one-half teaspoonful salt, one tablespoonful melted butter, one tablespoonful molasses. Put the corn meal into a bowl, pour the milk over, add the salt, butter, molasses, baking powder and well-beaten egg. Mix well. Bake on hot griddle.

Eula V. McWilliams is the daughter of Mr. and Mrs. John McWilliams. She is four months old and weighs nineteen pounds.



KODAK on the FARM

Before you begin the improvements, during the progress of the work and after the improvements have been completed—Keep a Kodak record.

In every phase of farm work and farm life there are pictures that are interesting and valuable. And *you* can make them.

THE YOUNG FOLKS

All letters from boys and girls to this department should be sent to office of The Wisconsin Farmer, Madison, Wisconsin.

RAISED A FINE COLT.

Dear Young Folks:—I am ten years old and live with my parents and four brothers and one sister on a 200-acre farm. Two years ago my father gave me a calf and I traded with my uncle for a colt. I fed it with milk and you can't imagine what a fine colt it is now. I put the saddle on her whenever I get a chance to go horseback. I call her Rosie.

I milk five cows in the evening but not always in the morning because you know boys like to sleep.

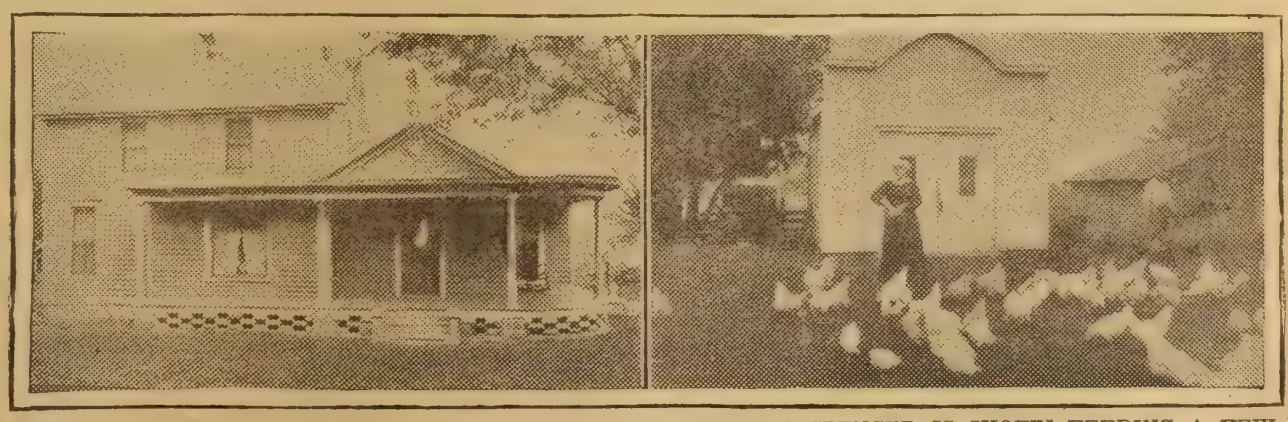
I also have a goat. She followed me to school one day. The boys had lots of fun with her. I have a quarter of a mile to go to school.

Last year I raised thirteen guinea hens, but they all died. My uncle has given me three fine looking ducks so I am going to raise ducks next summer. Henry.

GOES TO CONSOLIDATED SCHOOL.

Dear Young Folks:—As I have been interested in the Young Folks page I thought I would write to you.

I live in a large white house near the river. It is a mile and a half from the schoolhouse. I go to a consolidated school. It has been consol-



FARM HOME OF MR. AND MRS. J. H. SPENCER. AT THE RIGHT MRS. SPENCER IS SHOWN FEEDING A FEW OF HER FLOCK OF WHITE WYANDOTTES.

idated for two years. The old schoolhouse would not hold all of the pupils, so three country schoolhouses were brought in. There are seven buses.
